CHAMBERS'S

ENCYCLOPÆDIA:

A DICTIONARY

OF

UNIVERSAL KNOWLEDGE FOR THE PEOPLE.

ILLUSTRATED.

IN TEN VOLUMES.

VOL. VIII.

PHILADELPHIA:
J. B. LIPPINCOTT & CO.
EDINBURGH: W. & R. CHAMBERS.
1873.

Entered, according to Act of Congress, in the year 1871, by
J. B. LIPPINCOTT & CO.,
In the Office of the Librarian of Congress, at Washington.

A DICTIONARY OF

UNIVERSAL KNOWLEDGE FOR THE PEOPLE

PUE'RTO BE'LLO, a small decayed seaport town of the United States of Colombia, on the northern shore of the Isthmus of Panama, and 40 miles north of the town of that name. It is surrounded by mountains, has an excellent harbour, is very unhealthy, and has fallen into decay since the year 1739, when it was stormed by Admiral Vernon, during the war between England and Spain.

PUE'RTO DE SA'NTA MARI'A (usually called EL PUERTO, the Port), a seaport of Spain, in the modern province of Cadiz, stands at the mouth of the Guadalete, in a most fertile district, on the Bay of Cadiz, 6 miles north-east of the city of that name, and 9 miles by railway south-west of Xeres. Suspension-bridges cross the Guadalete and the Rio de S. Pedro. The mouth of the Guadalete forms the harbour; but the bar is dangerous and much neglected. P., a pleasant and well-built town, resembling Cadiz in its houses, and containing only one long and handsome street, while the others are narrow and ill paved, is the port for the shipment of Xeres wines. The wines are lodged in numerous *bodegas*, or wine-stores, lofty buildings built with thick walls and narrow windows, in order to secure an even temperature inside. From this port about 1,530,000 gallons of Xeres wines are exported to foreign lands, and about 26,000 gallons are transported inland. The bull-fights which take place here in May are among the most famous in the country. Steamers ply three times a day between this town and Cadiz, and P. supplies that city with drinking-water at a cost of £10,000 a year. Pop. 21,714.

PUE'RTO PRI'NCIPÉ, SANTA MARIA DE, an important inland town, in the east of the island of Cuba, about 325 miles east-south-east of Havana, and 45 miles south-west of its port, Las Nuevitas, with which it is connected by railway. Pop. 30,000.

PUERTO RI'CO, an island in the West Indies, belonging to Spain, is one of the Greater Antilles, and lies west of Hayti or St Domingo, lat. 17° 55′—18° 30′ N., long. 65° 39′—67° 11′ W. It is in size somewhat less than Jamaica, being fully 100 miles from east to west, 40 miles from north to south, and closely resembling a rectangle in shape. Area, 3897 square miles; pop. in 1864, 615,574, of whom 323,032 were pure whites, and 292,542 coloured. Of the latter, 249,900 were free, and the remaining 42,642 were slaves.

The island is traversed from east to west by a range of mountains, 1500 feet in average height, though rising in one peak to 3678 feet above the sea. From the base of the mountains, rich alluvial tracts extend to the sea, and there are numerous well-wooded and abundantly watered valleys. The climate is warm, but is considered more healthy than that of any other island of the West Indies. The soil is remarkably fertile. The principal crops are sugar, coffee, and tobacco of the finest quality, and cotton remarkable for its length of fibre, tenacity, and whiteness. Cattle and sheep are extensively reared, of a quality superior to any others in the West Indies. The value of the imports for the year 1867 was $7,767,415, and that of the exports, $5,761,720. The imports consist of cotton, woollen, linen, silk, and embroidered goods, metals, hardware, and provisions, as ale, porter, fruits, wines, &c. The exports are sugar, tobacco, coffee, cotton, molasses, rum, hides, and cattle.

The exports in each of the years 1866 and 1867 comprised the following articles:

Articles.	1866.	1867.
Brandy, hhds.,	255	219
Cotton, pounds,	1,301,390	1,085,998
Sugar, "	111,358,765	120,257,796
Coffee, "	14,924,810	19,220,194
Hides, "	1,042,440	775,042
Sheep, head,	8,161	8,640
Molasses, hhds.,	43,134	42,998
Tobacco, pounds,	3,379,966	1,747,879

The chief ports are San Juan, commonly called Puerto Rico (pop. stated at 10,000), in the north-east, Ponce in the south-west, and Mayaguez in the west. At the close of 1863 surveys had been completed for a railway running along the north coast

from San Juan to Arecibo, a distance of about 50 miles; while another railway along the south coast was about to be commenced. Owing to the great demand for cotton, consequent upon the American war, the cultivators have turned their attention to rearing that crop; and in 1863, four times the quantity grown in the previous year was produced.

PUFF-ADDER (*Clotho arietans*), a serpent of the family *Viperidæ*, having a short and broad flat head, with scales so sharply keeled as to end in a kind of spine. It is one of the most venomous and dangerous serpents of South Africa. It attains a length of four or almost five feet, and is thick in proportion to its length, often as thick as a man's arm. Its head is very broad; its tail suddenly tapered; its colour brown, chequered with dark

Puff-adder (*Clotho arietans*).

brown and white; a reddish band between the eyes; the under parts paler than the upper. Its movements are generally slow, but it turns very quickly if approached from behind. It usually creeps partially immersed in the sand of the South African deserts, its head alone being completely raised above ground. When irritated, it puffs out the upper part of its body, whence its name. The P. is easily killed by the oil, or even by the juice of tobacco. Its poison is used by the Bosjesmans for their arrows.—South Africa produces several other species of *Clotho*, similar in their habits to the P., and almost equally dangerous.

PUFFBALL (*Lycoperdon*), a Linnæan genus of *Fungi*, now divided into many genera, belonging to the section *Gasteromycetes*, and to the tribe *Trichospermi*. They mostly grow on the ground, and are roundish, generally without a stem, at first firm and fleshy, but afterwards powdery within; the powder consisting of the spores, among which are many fine filaments, loosely filling the interior of the *peridium*, or external membrane. The peridium finally bursts at the top, to allow the escape of the spores, which issue from it as very fine dust. Some of the species are common everywhere. Most of them affect rather dry soils, and some are found only in heaths and sandy soils. The most common British species is *L. gemmatum*, generally from one to two and a half inches in diameter, with a warty and mealy surface. The largest British species, the GIANT P. (*L. giganteum*), is often many feet in circumference, and filled with a loathsome pulpy mass, when young; but in its mature state, its contents are so dry and spongy that they have often been used for stanching wounds. Their fumes, when burned, have not only the power of stupifying bees, for which they are sometimes used, in order to the removal of the honey, but have been used as an anæsthetic instead of chloroform. The same properties belong also to other species. Some of them, in a young state, are used in some countries as food, and none of them is known to be poisonous.

PUFF-BIRD. See BARBET.

PUFFENDORF, SAMUEL, son of a Lutheran clergyman, was born in 1632 at Chemnitz, in Saxony. He received the early part of his education at Grimma; whence he removed to the university of Leipzig. There he studied theology for several years. In 1656 he went to the university of Jena, where he seems to have devoted himself at first chiefly to mathematics, and subsequently to the study of the *Law of Nature*, as he, and others who have treated on the same subject, have termed the law which regulates the duties of men to one another, independent of the mutual obligation which is enforced by political government, or by revelation of divine will. After quitting Jena, he was appointed tutor to the son of the Swedish ambassador at Copenhagen. Soon after he had received this appointment, a rupture having taken place between Denmark and Sweden, P. was detained as a prisoner in the Danish capital. The power of his mind here shewed itself in a remarkable manner. Deprived of books and of society, he threw himself vigorously into meditating on what he had formerly read in the treatise of Grotius, *De Jure Belli et Pacis*, and in the writings of Hobbes on the principles of general law. The result was the production of the *Elementa Jurisprudentiæ Universalis*—a work which was the foundation of its author's fortune. It was dedicated to the Elector Palatine; and by this prince, P. was appointed to the Professorship of the Law of Nature and Nations at the university of Heidelberg. He now gave his attention to the tissue of absurdities which existed in the constitution of the Germanic Empire. As was to have been expected, the work (*De Statu Reipublicae Germanicae*, 1667), in which he exposed the defects of the system, raised a storm of controversy. Austria was especially furious. P. had taken care to publish it under a pseudonym—that of Severinus a Mozambano, but still, to avoid the possible consequences, he accepted an invitation from Charles XI. of Sweden, in 1670, to become Professor of the Law of Nations at Lund. During his residence there, he published the work on which his fame now principally rests, *De Jure Naturæ et Gentium*. He then removed to Stockholm, where the king of Sweden made him his historiographer, with the dignity of a counsellor of state. In his official character, he published a very uninteresting history of Sweden, from the expedition of Gustavus Adolphus into Germany to the death of Queen Christine. In 1688, the Elector of Brandenburg invited him to Berlin to write the history of his life and reign. P. accepted the invitation, and executed the required work in 19 dreary volumes. His intention was to have returned to Stockholm, but death overtook him at Berlin in 1694. P. lacked the genius to render the subjects on which he wrote generally interesting, but his intellectual power was nevertheless very considerable, and it appears to have throughout been honestly exercised and with unflagging industry.—See Jenisch's *Vita Pufendorfii* in the *Memoirs of the Academy of Stockholm*, 1802.

PU'FFIN (*Mormon*), a genus of birds of the Auk (q. v.) family, *Alcidæ*, having the bill shorter than the head, very much compressed, its height at the base equal to its length, the ridge of the upper mandible as high as the top of the head, both mandibles arched, and transversely grooved. The

bill gives to the birds of this genus a very extraordinary appearance. They have short legs, very short tail, and short wings; their legs are placed far back, and they sit very erect, like auks and penguins, resting not merely on the foot, but on the tarsus. Notwithstanding their shortness of wing, they fly rapidly, although they seem incapable of long-sustained flights. They swim and dive admirably. The best known and most widely distributed species is the COMMON P. (*M. arcticus*), a native of the arctic and northern temperate regions, breeding not only in high northern latitudes, but as far south as the coasts of England, and migrating from the colder regions in winter, when it is to be found even on the coasts of Spain and of Georgia. The P. is a little larger than a pigeon; the forehead, crown, back of the head, a collar round the neck, the back, wings, and tail are black, the other parts of the plumage white. The P. lays only a single egg, sometimes in a rabbit burrow, but more frequently in a burrow of its own, which often extends three feet, and is not unfrequently curved; sometimes in deep fissures or crevices of cliffs. Great numbers congregate together, and their chosen breeding-places are crowded with them. These are mostly on unfrequented islands and headlands, where there is some depth of soil. In some of them, the ground is covered by puffins, old and young, in thousands. The eggs are sought after by fowlers, and also the young birds, the flesh of which is used for food. The Scilly Isles were held in the 14th c., under the king as Earl of Cornwall, by Ranulph de Blancminster, for an annual payment of 6s. 8*d*., or 300 puffins at Michaelmas. Puffins are not readily

Common Puffin (*Mormon arcticus*).

alarmed by the approach of man, and many are taken by means of a noose at the end of a rod. Their food consists of small crustaceans and fishes. —Other species are found in different parts of the world; one in Kamtchatka, the Kurile Islands, &c., with two silky tufts of long feathers on its head. —The name P. is given in France to the *Shearwaters* (q. v.), or *Puffin Petrels*, the genus *Puffinus* of some ornithologists.

PUG, or PUG-DOG, a kind of dog much like the bull-dog in form, and in particular, in its much abbreviated muzzle. The nose is often a little turned up. The disposition is, however, extremely unlike that of the bull-dog, being characterised by great timidity and gentleness. Pug-dogs are only kept as pets. They are often very affectionate and good-natured, bearing without resentment the roughest handling to which children can subject them. They are all of small size. The common English Pug is usually yellowish with a black snout, the tail firmly curled over the back. New breeds have

Chinese Pug (Looty), found in the Summer Palace at Pekin. Presented to Her Majesty.

of late been introduced from China and Japan, interesting from their peculiar appearance, gentleness, and docility, with extremely short *pug-ish* muzzle; the Chinese breed very small, with smooth hair; the Japanese rather larger, with an exuberance of long soft hair and a very bushy tail.

PU'GET SOUND, a collection of inlets on the north-western border of Washington Territory, U.S., forming the southern termination of Admiralty Inlet, which communicates with the Pacific by the Strait of St Juan de Fuca, south-east of Vancouver's Island. It forms a sheltered bay and harbour of about 15 square miles, surrounded by a fertile well-timbered country.

PU'GGING, a coarse kind of plaster laid on deafening-boards between the joists of floors, to prevent sound.

PU'GILISM, or **BOXING**, is the art of defending one's self or attacking others with the weapons which nature has bestowed—viz., fists and arms. The origin of boxing, or the use of the fists, is likely as old as man himself. We find numerous allusions to it in the classic authors. Pollux, the twin-brother of Castor in the heathen mythology, was reckoned the first who obtained distinction by the use of his fists, conquering all who opposed him, and obtaining, with Hercules, a place among the gods for his sparring talents. The ancients were not, however, satisfied with the use of the weapons of nature, but increased their power by the addition of the Cestus (q. v.). With the ancients, pugilism was considered an essential part in the education of youth, and formed part of the course of training practised in their gymnasia; it was valued as a means of strengthening the body and banishing fear; but it was practised in public rather with a view to the exhibition of the power of endurance than for mere skilful self-defence. The earliest account we have of systematic British boxing is in 1740, when public exhibitions of professors of the art attracted general attention. Up to this period, the science of self-defence had made but little progress, and strength and endurance constituted the only recommendations of the practitioners at Smithfield, Moorfield, and Southwark fair, which had long had booths and rings for the display of boxing. Broughton, who occupied the position of 'champion of England,' built a theatre in Hanway Street, Oxford Street, in 1740, for the display of boxing; advertisements were issued announcing a succession of battles between first-rate

pugilists, who never quitted the stage till one or other was defeated, the reward of each man being dependent upon, and proportioned to, the receipts. Broughton was for 18 years champion of England, and with him commences the first scientific era of pugilism. He propounded some rules for the regulation of the ring, and these remained in authority till 1838, when they were materially altered. Rule 1 is, That a square of a yard be chalked in the middle of a stage, and that in every fresh set to after a fall, the seconds are to bring their men to the side of the square, and to place them opposite each other, and until this is done, it is not lawful for one to strike the other. Rule 2, That if either of the combatants is unable to be brought up to the square within 30 seconds after a fall and the close of a round, he shall be deemed a beaten man. No man is permitted to hit his adversary when he is down, or to seize him by the breeches, or below the waist, and a man on his knees is to be reckoned down. These rules laid the foundation of fair play, and robbed boxing of half its horrors. To Broughton also is due the introduction of gloves for 'sparring-matches,' where lessons could be taken without injury. The greatest professor of the art was Jackson, who was champion in 1795. He was not only the most scientific boxer of his day, but he gave his art such a prestige and popularity that half the men of rank and fashion of the period were proud to call themselves his pupils. He opened rooms for the practice of boxing in Bond Street, and for years these were crowded by men of note. His 'principles of pugilism' were, that contempt of danger and confidence in one's self were the first and best qualities of a pugilist; that in hitting, you must judge well your distances, for a blow delivered at all out of range, was like a spent shot, and valueless; that men should fight with their legs, using all possible agility, as well as with their hands; and that all stiffness of style and position was wrong. Jackson is still regarded as the best theorist on the 'noble art,' and since his time, it has received no essential improvement. Shaw, the Life Guardsman, who immortalised himself at Waterloo, was a pupil of his, and the prowess which he so brilliantly displayed on that occasion, was owing as much to his scientific training as to his great strength. At this period, pugilism was actively supported by many persons of high rank —the Dukes of York and Clarence, the Earls of Albemarle, Sefton, &c., Lords Byron, Craven, Pomfret. In 1814, when the allied sovereigns were in England, among other entertainments, a 'sparring' display was provided under Jackson's management; and the distinguished foreigners expressed the great gratification they had experienced from the exhibition of so much science and fine physical development. Besides Jackson, Belcher, Gulley, and Cribb were noted champions at this period. George IV. was a staunch patron of boxing in his youth, and although he discontinued by his presence to give countenance to the sport, frequent indications were observable of his desire for its promotion. At the time of the coronation, when the popular feelings were much enlisted on behalf of Queen Caroline, who was excluded from the throne, a body of pugilists were employed to preserve order; and so well did these men perform their duties, that the king presented each man with a gold medal, to commemorate the event, and to shew his satisfaction. This period may be termed the 'palmy days of the ring;' and from various causes, its decline has since then been uninterrupted. Among other causes, several cases occurred of prize-fighters who were tempted to lose fights on which large sums had been staked, and to deceive their most influential backers. The more distinguished patrons of the ring gradually seceded; the 'Pugilistic Club,' which had been established in 1814, and which included all the aristocratic patrons of the ring, was broken up. The magistracy of the country set their faces against the lawless assemblies of 'roughs' and pickpockets who latterly formed the greater part of the spectators at prize-fights. The electric telegraph, and the establishment of an efficient rural police, have given the finishing touches to an already-expiring profession. Matches can now only be got up by stealth, and the place of meeting is kept a profound secret to the last moment, for fear of interruption. A few years ago, however, the international combat between Tom Sayers the Englishman, and John Heenan the American, revived for a moment public interest in the art; but apart from exceptional matches, the popular feeling is that prize-fighting should not be countenanced, and we may look for its gradual extinction. The art of boxing, as an active and healthy exercise, is likely to be maintained; and the display of science between two accomplished boxers is very interesting, while it is deprived of all the horrors of the prize-ring; the rapidity of the blows, the facility with which they are mostly guarded or avoided by moving the head and arms; the trial of skill and manœuvre to gain a trifling advantage in position, all give a wonderful interest to the spectator, who can watch the perfection of the art devoid of the brutalities of the ring. The pugilists of the present day are mostly publicans; their friends and the patrons of the 'fancy' meet at their houses for convivial evenings, sparring-matches, ratting, and the like. It has constantly been urged in defence of pugilism, that were it abolished, the use of the knife would increase, and Englishmen would lose their present manly system of self-defence. This may be true, if the use of the fist in self-defence depended on the mercenary exhibition of pugilistic encounters, which, however, is mere assumption.—The best authority on the subject of pugilism is *Fistiana*, 24th ed. 1863, office of *Bell's Life*.

PULCI, Luigi, an Italian poet of distinguished family, was born at Florence, 3d December 1431, and devoted his life to study and to literary composition. He was one of the most intimate friends of Lorenzo de' Medici and of Poliziano, from the latter of whom he derived no little assistance in the composition of his poem *Il Morgante Maggiore* (Morgante the Giant). This celebrated work, a burlesque epic (in 28 cantos), of which Roland is the hero, is a vivacious parody of the romances of Carlovingian chivalry, which had become (as P. thought) undeservedly popular in Italy. His mocking imagination took a pleasure in turning into ridicule the combats with giants, the feats of magicians, and all the incredible adventures that form the material basis of the medieval epic; and he manages to do it with a wonderfully pleasant and original naïveté. But although the poem is essentially heroico-comic, it occasionally contains passages of the finest pathos, in which P. fortunately seems to forget his design of travestying the inventions of the *trouvères*, and comes out undisguisedly as a real poet. Moreover, in the midst of the most extravagant buffooneries, we come upon the truest and most natural pictures of manners—the vanity and inconstancy of women, the avarice and ambition of men. P. died in 1487. The *Morgante Maggiore* is one of the most valuable sources for acquiring a knowledge of the early Tuscan dialect, the niceties and idioms of which have been employed by P. with great skill. The first edition appeared at Florence in 1488, and has since been frequently reprinted. Other works of

P. are a series of sonnets (often grossly indecent), *La Beca da Dicomano* (a parody of a pastoral poem by Lorenzo de' Medici); *Confessione a la San Vergine*, a novel; and some letters.—BERNARDO PULCI, elder brother of Luigi, wrote an elegy on the death of Simonetta, mistress of Julian de' Medici; and a poem on the passion of Christ, and also executed the first translation of the *Eclogues* of Virgil.—LUCA PULCI, another brother, achieved some literary reputation too by his *Giostra di Lorenzo de' Medici*, a poem in honour of the success won by Lorenzo in a tournament; *Il Ciriffo Calvaneo*, a metrical romance of chivalry; *Driadeo d'Ancore*, a pastoral poem; and *Epistole Eroide*.

PU'LEX. See FLEA.

PULKO'VA, a village of Russia, in the government of St Petersburg, about 9 miles south of the capital, contains a population of 600. It stands on a ridge called the Pulkova Hills, which command a splendid view of St Petersburg, and is noted for its magnificent observatory, built by the Czar Nicholas, and placed under the direction of M. Otto Struve. For an interesting description of the observatory, see Professor C. Piazzi Smyth's *Three Cities in Russia* (2 vols., Lond. 1862).

PU'LLEY, one of the Mechanical Powers (q. v.), consists of a wheel, with a groove cut all round its circumference, and movable on an axis; the wheel, which is commonly called a *sheave*, is often placed inside a hollow oblong mass of wood called a *block*, and to the sides of this block the extremities of the sheave's axle are fixed for support; the cord which passes over the circumference of the sheave is called the *tackle*. Pulleys may be used either singly or in combination; in the former case, they are either *fixed* or *movable*. The *fixed pulley* (fig. 1) gives no mechanical advantage; it merely changes the direction in which a force would naturally be applied to one more convenient—thus, W can be raised without lifting it directly by merely pulling P down. The *single movable pulley*, with parallel cords, gives a mechanical advantage = 2 (fig. 2), for a little consideration will shew that as the weight, W, is supported by two strings, the strain on each string is ½W, and the strain on the one being supported by the hook A, the power, P, requires merely to support the strain on the other string, which passes round C. The fixed pulley, C, is only of service in changing the naturally upward direction of the power into a downward one. If the strings in the single movable pulley are not parallel, there is a diminution of mechanical advantage—i. e., P must be more than half of W to produce an exact counterpoise; if the angle made by the strings is 120°, P must be equal to W; and if the angle be greater than this, there is a mechanical disadvantage, or P must be greater than W. The following are examples of different combinations of pulleys, generally known as the first, second, and third systems of pulleys. In the first system, one end of each cord is fastened to a fixed support above; each cord descends, passes round a pulley (to the lowest of which the weight, W, is fastened), and is fastened to the block of the next pulley, with the exception of the last cord, which passes round a fixed pulley above, and is attached to the counterpoise P. The tension of a string being the same in all its parts, the tension of every part of the string marked (1) in fig. 3 is that which is produced by the weight of P, consequently, as the last movable pulley is supported on both sides by a string having a tension P, the tension applied in its support is 2P. The tension of the string marked (2) is therefore 2P, and the second movable pulley is supported by a force equal to 4P. It may similarly be shewn that the force applied by the strings marked (4) in support of the last pulley (which is attached to W), is 8P. Hence we see, that according to this arrangement, 1 lb. can support 4 lbs., if two movable pulleys are used; 8 lbs., if there are 3 movable pulleys; 16 lbs., if there are 4 movable pulleys; and if there are *n* movable pulleys, 1 lb. can support 2^n lbs. It must be noticed, however, that in practice, the weight of the cords, and of the pulleys, and the friction of the cord on the pulleys, must be allowed for; and the fact, that in this system all of these resist the action of the power P, and that to a large extent, has rendered it of little use in practice.—The second system is much inferior in producing a mechanical advantage, but it is found to be much more convenient in practice, and is modified according to the purpose for which it is to be used; two prevalent forms are given in figs. 4 and 5. In this system, one string passes round all the pulleys, and as the tension in every part of it is that produced by the weight of P, the whole force applied to elevate the lower block with its attached weight, W, is the weight P multiplied by the number of strings attached to the lower block; in fig. 4, W = 4P, and in fig. 5, W = 6P, the pulleys in the upper block being only of use in changing the direction of the pulling force. This system is the one in common use in architecture, in dockyards, and on board ship, and various modifications of it—such as White's pulley, Smeaton's pulley, &c., have been introduced; but the simpler forms shewn above have been found to answer best.—The third system (fig. 6) is merely the first system inverted, and it is a little more powerful, besides having the weight of the pulleys to support the power, instead of acting in opposition to it, as in the former case. By this time, it will have been evident to the reader that the mechanical advantage is not produced by the pulleys, but by the strings, and that the pulleys are merely useful in keeping the strings in a certain position, changing with as little friction as possible the direction of the pull, and

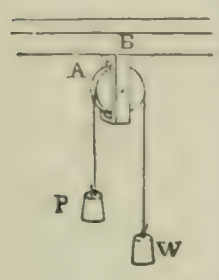

Fig. 1.

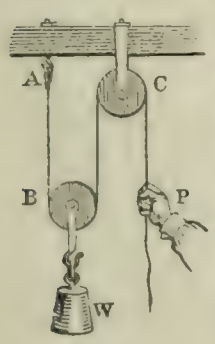

Fig. 2.

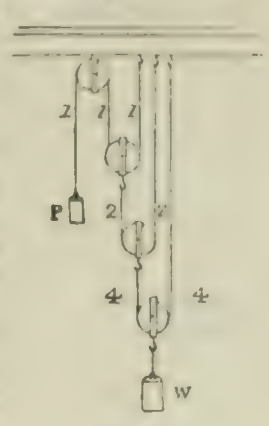

Fig. 3.

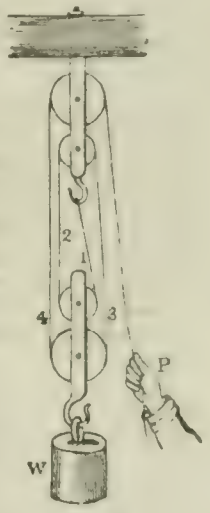

Fig. 4.

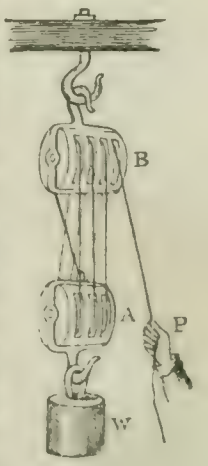

Fig. 5.

affording a convenient means of attaching the weight. Theoretically, the larger the number of movable pulleys in one combination, the greater is the mechanical advantage afforded; but the enormous friction produced, and the want of perfect flexibility in the ropes, prevent any great increase in the number of pulleys.

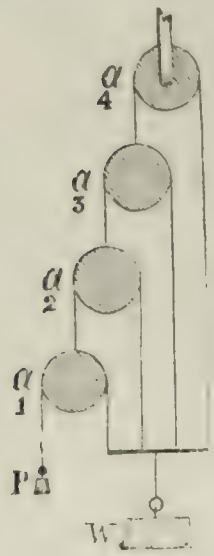

Fig. 6.

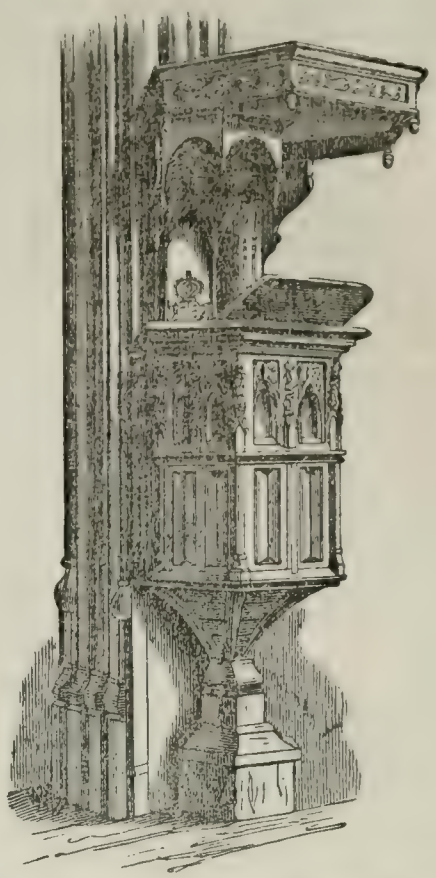

PULMONA'TA, an order of gasteropodous molluscs, having, for the purpose of respiration, a vascular air-sac or lung, which opens by a hole under the margin of the mantle, capable of being contracted or dilated at pleasure. Some are terrestrial, some aquatic. Slugs and snails are familiar examples of the former; water-snails, or pond-snails (*Limnæa*, *Planorbis*, &c.), of the latter. Most of the P. are protected by a shell; in some, as slugs, the shell is internal and rudimental.

PULNEYS, a range of hills in the Madura district of the Madras Presidency of India. The average height of this range is about 7500 feet above the level of the sea. It possesses peculiar advantages for the establishment of a sanitarium. The climate is one of the most equable anywhere to be found, the variation of the thermometer during twelve months in a closed room without a fire being observed to be no greater than between 58° and 62°. At present, there are only a few European residences built on these hills.

PU'LO-PENA'NG. See PRINCE OF WALES' ISLAND.

PULP, a term employed to describe those very soft and succulent parts of plants, almost exclusively of fruits, which consist of cellular tissue with much juice. The pulp of a fruit is sometimes found in one part of it, sometimes in another; thus, in the peach, plum, and other drupes, it is the *mesocarp;* in the grape and gooseberry, it is developed from the placentas, and the seeds are embedded in it.

PU'LPIT (Lat. *pulpitum*), an elevated tribune or desk, from which sermons, lectures, and other solemn religious addresses are delivered. In great churches, the pulpit is commonly placed against the wall, or in juxtaposition with a pillar or buttress. Originally it would appear to have been used chiefly for the singing, chanting, or recitation which form part of the public service, and was a kind of stage sufficiently large to accommodate two or even more chanters. For the convenience of the hearers, this stage began to be used by the bishop, priest, or deacon, for the delivery of the homily; and thus by degrees a tribune expressly suited to the latter use alone came to be introduced. In some of the older churches, the *ambo* or *pulpitum* is still used for the chanting of the Gospel and Epistles. In Catholic churches, the pulpit is generally distinguished by some religious emblems, especially by the crucifix; and the pulpits of the Low Countries and of Germany are often masterpieces of wood-carving, the preaching-place in some of them forming part of a great artistic group, as of the Conversion of St Paul, the Vocation of Peter and Andrew, the Temptation of Adam and Eve, and other similar subjects. The pulpit (in Arabic, *mimber*) forms

Pulpit (Fotheringhay, Northamptonshire, 1440 A. D.).
(From Parker's *Glossary*.)

one of the scanty appliances of Mohammedan worship.

PULQUE, a favourite beverage of the Mexicans and of the inhabitants of Central America, and some parts of South America; made from the juice of different species of *Agave* (q. v.), which is collected by cutting out the flowering-stem from the midst of the leaves in the beginning of its growth, and scooping a hole for the juice. From this cavity, large quantities of juice are removed daily for months. The juice is an agreeable drink when fresh, but is more generally used after fermentation, when it has a very pleasant taste, but a putrid smell, disgusting to those unaccustomed to it. Pulque is retailed in Mexico in open sheds called *Pulquerias*, which also serve for dancing-rooms. When mixed with water and sugar, and allowed to ferment for a few hours, it forms a beverage called *Tepache*. A kind of spirit is also prepared from it.

PULSE (Lat. *puls*), a name for the edible seeds of leguminous plants, as *corn* is the name for the edible seeds of grasses. Peas and beans are the most common and important of all kinds of pulse; next to them may be ranked kidney-beans, lentils, chick-peas, pigeon-peas, &c. *Legumine* (q. v.), a very nitrogenous principle, abounds in all kinds of pulse. Legumine forms a thick coagulum with salts of lime, wherefore all kinds of pulse remain hard if boiled in spring-water containing lime. The best kinds of pulse are very nutritious, but not easy of digestion, and very apt to produce flatulence.

PULSE (Lat. *pulsus*, a pushing or beating). The phenomenon known as the arterial pulse or arterial pulsation is due to the distention of the arteries consequent upon the intermittent injection of blood into their trunks, and the subsequent contraction which results from the elasticity of their walls. It is

perceptible to the touch in all excepting very minute arteries, and in exposed positions, is visible to the eye. 'This pulsation,' says Dr Carpenter, 'involves an augmentation of the capacity of that portion of the artery in which it is observed; and it would seem to the touch as if this were chiefly effected by an increase of diameter. It seems fully proved, however, that the increased capacity is chiefly given by the elongation of the artery, which is lifted from its bed at each pulsation, and when previously straight, becomes curved; the impression made upon the finger by such displacement not being distinguishable from that which would result from the dilatation of the tube in diameter. A very obvious example of this upheaval is seen in the prominent temporal artery of an old person.'—*Principles of Human Physiology*, 4th ed., p. 492. The number of pulsations is usually counted at the radial artery at the wrist, the advantages of that position being that the artery is very superficial at that spot, and that it is easily compressed against the bone. In some cases, it is preferable to count the number of contractions of the heart itself.

The qualities which are chiefly attended to in the pulse are its frequency, its regularity, its fulness, its tension, and its force.

The *frequency* of the pulse varies greatly with the age. In the fœtus *in utero*, the pulsations vary from 140 to 150 in the minute; in the newly-born infant, from 130 to 140; in the 2d year, from 100 to 115; from the 7th to the 14th year, from 80 to 90; from the 14th to the 21st year, from 75 to 85; and from the 21st to the 60th year, 70 to 75. After this period, the pulse is generally supposed to fall in frequency, but the most opposite assertions have been made on this subject. There are many exceptions to the preceding statement; young persons being often met with having a pulse below 60, and cases not unfrequently occurring in which the pulse habitually reached 100, or did not exceed 40 in the minute, without apparent disease. The numbers which have been given are taken from an equal number of males and females, and the pulsations taken in the sitting position. The influence of sex is very considerable, especially in adult age, the pulse of the adult female exceeding in frequency that of the male of the same age by from 10 to 14 beats in the minute. The effect of muscular exertion in raising the pulse is well known; and it has been found by Dr Guy that posture materially influences the number of pulsations. Thus, in healthy males of the mean age of 27 years, the average frequency of the pulse was, when standing, 81, when sitting, 71, and when lying, 66, per minute; while in healthy females of the same age the averages were—standing, 91; sitting, 84; and lying, 79. During sleep, the pulse is usually considerably slower than in the waking state. In disease (acute hydrocephalus, for example), the pulse may reach 150 or even 200 beats; or, on the other hand (as in apoplexy and in certain organic affections of the heart), it may be as slow as between 30 and 20.

Irregularity of the pulse is another condition requiring notice. There are two varieties of irregular pulse: in one, the motions of the artery are unequal in number and force, a few beats being from time to time more rapid and feeble than the rest; in the other variety, a pulsation is from time to time entirely left out, constituting intermission of the pulse. These varieties often concur in the same person, but they may exist independently of each other. Irregularity of the pulse is natural to some persons; in others, it is the mere result of debility; but it may be caused by the most serious disorders, as by disease of the brain, or by organic disease of the heart; and hence the practical importance of ascertaining the various meanings of this symptom.

The pulse is said to be *full* when the volume of the pulsation is greater than usual, and it is called *small* or *contracted* under the opposite condition. A full pulse may depend upon general plethora, on a prolonged and forcible contraction of the left ventricle of the heart, and possibly, to a certain extent, on relaxation of the arterial coats; while a small pulse results from general deficiency of blood, from feeble action of the heart, from congestion of the venous system, or from exposure to the action of cold. When very small, it is termed *thread-like*.

The *tension* of the pulse is the property by which it resists compression, and may be regarded as synonymous with *hardness*. A hard pulse can scarcely be stopped by any degree of pressure of the finger. It occurs in many forms of inflammation, and its presence is commonly regarded as one of the best indications of the necessity of venesection. A *soft* or compressible pulse is indicative of general weakness.

The *strength* of the pulse depends chiefly on the force with which the blood is driven from the heart, but partly also upon the tonicity of the artery itself and the volume of the blood. A strong pulse is correctly regarded as a sign of a vigorous state of the system; it may, however, arise from hypertrophy of the left ventricle of the heart, and remain as a persistent symptom even when the general powers are failing. As strength of the pulse usually indicates vigour, so *weakness* of the pulse indicates debility. There may, however, be cases in which weakness of the pulse may occur in association with undiminished energy of the system at large. For example, active congestion of the lungs may so far impede the passage of the blood through these organs that it cannot reach the heart in due quantity; the necessary result is a weak and feeble pulse, which will rapidly increase in strength if the congestion is relieved by free blood-lettings. Various expressive adjectives have been attached to special conditions of the pulse, into the consideration of which our space will not permit us to enter. Thus, we read of the jerking pulse, the hobbling pulse, the corded pulse, the wiry pulse, the thrilling pulse, the rebounding pulse, &c.

PULTOWA. See POLTAVA.

PU'LTUSK, a town of Poland, in the government of Plock, is situated in a thickly-wooded district on the Narew, 35 miles north-north-east of Warsaw. It contains numerous churches and a very large bishop's palace. Pop. 4772. Here, on December 26, 1806, was fought one of the battles of the campaign of Eylau, between the Russians and the French. The field was most obstinately contested, but the victory, which, however, was claimed by both armies, inclined in favour of the French.

PU'LU, a beautiful substance, resembling fine silk, of a rich brown colour and satin lustre, used largely as a styptic by the medical practitioners of Holland, and lately introduced into this country for the same purpose. It consists of the fine hairs from the stipes of one or more species of tree-fern, referrible, without doubt, to the genus *Cibotium*. It was first imported into this country in 1844 from Owhyhee under the name of Pulu, or vegetable silk, and was proposed as a substitute for silk in the manufacture of hats, but could not be applied. In 1856, it was again imported from Singapore under the Malay names of Penghawar Djambi and Pakoe Kidang, and was said to have been used in Dutch pharmacy for a long period as a styptic. Several importations have since taken

place, and it has been successfully used. It acts mechanically by its great absorbent powers.

PU'MA, or COUGAR (*Felis concolor*, *Leopardus concolor*, or *Puma concolor*), one of the largest of the American *Felidæ*, rivalled only by the jaguar. It is sometimes called the American Lion, although it is more allied to the leopard, notwithstanding its want of spots and stripes. It is from 4 to 4¼ feet in length from the nose to the root of the tail, and the tail about 2 feet or 2½. The fur is thick and close, reddish-brown above, lighter on the sides, and reddish-white on the belly; the muzzle, chin, throat, and insides of the legs grayish-white, the breast almost pure white. Young pumas have dark-brown spots in three rows on the back, and scattered markings elsewhere, exhibiting the relation to the leopards. The long tail of the P. is covered with thick fur, and is generally coiled up, as if it were prehensile, which it does not seem to be, although the P. climbs trees very well, and often descends on its prey from among their branches. The P. was formerly found in all except the coldest parts of America, but is now rare in most parts of North America, having been expelled by man. It rarely attacks man, but is very ready to prey on domestic animals, and seems to have a thirst for blood beyond that of other *Felidæ*, one P. having been known to kill 50 sheep in a night, drinking a little of the blood of each; a very sufficient reason for the anxiety which all American farmers shew for its destruction. Yet it is easily tamed, and when tamed, a very gentle creature, purring like a cat, and shewing equal love of attentions. The geographical range of the P. extends far southwards in Patagonia, and northwards even to the state of New York, although it is now very rare in all long-settled parts of North America. It is the *Painter* (Panther) of North American farmers. It sometimes issues from the forests, and roams over prairies and pampas, and is not unfrequently caught by the lasso of South American hunters.—A BLACK P. (*Felis nigra* of some naturalists), a doubtful species, and probably only a variety of the common P., is found in some parts of South America.

PU'MICE, a mineral found in volcanic countries, generally with obsidian and porphyries. In chemical composition, it agrees with obsidian, of which it may be regarded as a peculiar form, rapidly cooled from a melted and boiling state. It is of a white or gray colour, more rarely yellow, brown, or black; and so vesicular, that in mass, it is lighter than water, and swims in it. The vesicles, or cells, are often of a much elongated shape. P. often exhibits more or less of a filamentous structure; and it is said to be most filamentous when silica is most abundant in its composition. It is very hard and very brittle. It is much used for polishing wood, ivory, metals, glass, slates, marble, lithographic stones, &c., and in the preparation of vellum, parchment, and some kinds of leather. Among other purposes to which it is applied is the rubbing away of corns and callosities. Great quantities are exported from the Lipari Isles to Britain and all parts of Europe. The Lipari Isles are in great part composed of P., which there, as in some other places, occurs as a rock. P. is the chief product of some volcanic eruptions; but in some eruptions, none is produced. It is found also in regions where there are now no active volcanoes, as at Andernach on the Rhine.

PU'MPKIN. See GOURD.

PUMPS are machines for raising water and other fluids to a higher level. They are divided into several classes according to their mode of action. Of these, as the most important, we shall describe in detail the following: 1. The Lift or Suction Pump; 2. The Lift and Force Pump; 3. The Chain-pump; 4. The Centrifugal Pump; 5. The Jet-pump.

1. *The Lift or Suction Pump.*—The diagrams figs. 1 and 2 represent the ordinary suction pump. A is a cylinder, which is called the barrel; with it is connected at the bottom a pipe, B, which communicates with the water to be raised; and at its top is another pipe, C, which receives the water raised. In the barrel are placed two valves, D and E. D is fixed in position at the bottom of the barrel; E is

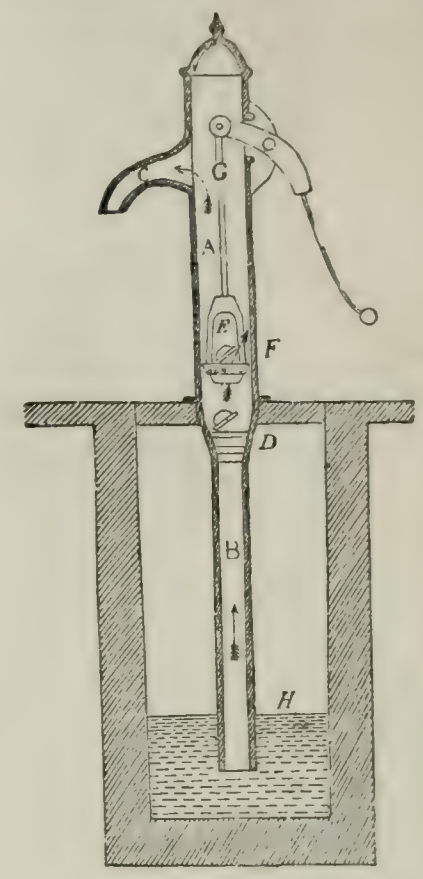

Fig. 1.

attached to, and forms part of the piston F, which moves up and down the barrel when motive-power is applied to the rod G. The piston, or bucket, consists of a cylindrical piece of wood or metal, which fits exactly the barrel in which it moves, so that no water or air can pass between its circumference and the sides of the cylinder. This tight fitting is attained in wooden pistons by surrounding them with a leather ring; and in those of metal, by hemp or other packing, which is wrapped round a groove made in their outer surface. The hollow interior of the piston is closed at the top by the valve E, which is a kind of door opening on a hinge, at one side of it, in an upward direction, on the application of pressure, and shutting on to its seat on the piston when the pressure is removed. When opened, water or air can pass through it to the upper side of the piston; but when shut, none can pass from one side of the piston to the other. The other valve, D, is similar to it in all respects, except that, as before stated, it is fixed in the bottom of the barrel; it also can only open upwards.

To describe the action of the pump, we shall suppose the piston to be at the bottom of the barrel, and the pump to contain nothing but air. On moving the piston up the barrel—the valve in it being shut, and kept so by the atmospheric pressure above it—no air can pass from above it into the

Vol. VIII., page 8.

PUMA.

part of the barrel from which it is moving; the air contained in which becoming rarefied, by having to occupy a greater space, exerts less pressure on the valve D at the bottom of the barrel than the air in suction-pipe B below it. This valve is thus opened, and the air from the suction-pipe enters the barrel; so that when the piston has arrived at the top, a volume of air equal to the contents of the barrel has passed from the suction-pipe into the barrel. When the piston descends, it compresses the air in the barrel, which shuts the valve D; and when the density of the compressed air becomes greater than that of the atmosphere, the valve E in the piston is forced open, and the air in the barrel passes to the upper side of the piston. The next upward stroke of the piston again draws a like quantity of air from the suction-pipe into the barrel; and, as none of this air again enters the pipe, but is passed to the upper side of the piston by its downward stroke, the suction-pipe is by degrees emptied of the air it contained. During this process, however, motion has taken place in the water at the foot of the suction-pipe. The surface of the water at H is pressed upon by the weight of the atmosphere with a pressure of about 15 lbs. on every square inch; and by the laws of fluid-pressure, if an equal pressure is not exerted on the surface of the water in the suction-pipe, the water will rise in it, until the pressure on its surface, plus the weight of its fluid column, balances the pressure of the atmosphere on the surface H outside; so that, as the air in the suction-pipe is rarefied, the water rises in it, until, when all the air is extracted from it, the water stands at the level of the valve D. By the next upward stroke of the piston, the barrel being emptied of air, the water follows the piston, and fills the barrel as it filled the suction-pipe. The pressure produced by the downward stroke shuts the valve D, and forces the water in the barrel through the valve E. The succeeding upward stroke carries this water into the pipe above, and again fills the barrel from the suction-pipe. In like manner, every successive upward stroke discharges a body of water equal to the content of the barrel into the pipe above it, and the pump will draw water as long as the action of the piston is continued.

Fig. 2.

The action of this pump may be more shortly described by saying that the piston withdraws the air from the barrel, and produces a vacuum, into which the water rushes through the suction-pipe, impelled by the pressure of the atmosphere on its surface. This atmospheric pressure balances a column of water of about 33 feet in height; so that if the barrel be placed at a greater height than this from the surface of the water in the well, the water will not rise into it, and the pump will not draw.

With regard to its efficiency—that is to say, the relation between the power expended and the work produced, as measured by the water raised we may remark, that the power is expended 1st, in raising the water through the required height; 2d, in overcoming the friction of the moving parts of the pump; 3d, in the friction and fluid resistance of the water in passing through the valves and pipes; 4th, in the losses arising from the want of proper proportion between the various parts of the pump. The losses arising from these last sources are very great, and vary so much according to the construction of each particular pump, that no useful estimate can be formed of the efficiency. We may say, however, that a pump of this description, to yield 50 per cent. of the applied power, must be well proportioned and carefully constructed.

2. *The Lift and Force Pump.*—Figs. 3 and 4 represent two varieties of this pump. That shewn in fig. 3 is very similar to the suction-pump before described, with this exception, that the valve E,

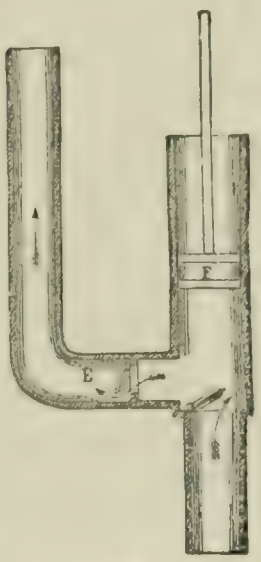

Fig. 3.

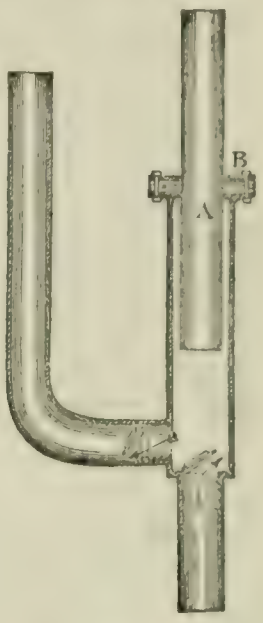

Fig. 4.

instead of being fixed on the piston, is placed in the discharge-pipe, the piston itself being solid. The water is drawn up into the barrel by suction in the manner just described in the suction-pipe, and then the pressure of the piston in its downward-stroke forces it through the valve E to any height that may be required. That shewn in fig. 4 is provided with a different description of piston, called the plunger-pole. Its action is precisely the same as that of the other, with this exception, that the plunger-pole, instead of emptying the barrel at every stroke, merely drives out that quantity which it displaces by its volume. It is simply a solid rod of metal, A, moving through a water-tight stuffing-box, B. This stuffing-box is made by placing, on a circular flange of metal, rings of india-rubber or other packing, the inner diameter of which is slightly less than that of the plunger-pole. On these is placed a ring of metal, and through the whole are passed bolts, which, on being screwed tight, force the packing tightly against the plunger-pole. It possesses many advantages, for the packing can be tightened and repaired without removal of the piston or stoppage of the pump; also, the cylinder is not worn by its action, nor does it require to be accurately bored out, as in the other form of pump.

In these pumps, it will be observed that the water is forced into the ascending pipe or column only on the downward stroke; it will thus be

discharged in a series of rushes or jerks. As it is a great object to procure a continuous discharge, both for its convenience, and for the saving of the power wasted by the continual acceleration and retardation of the ascending column, various methods have been used for that purpose. The most common is the reservoir of air, which is an air-tight receptacle fixed vertically on the discharge-pipe; the water forced into the pipe by the down-stroke compresses this air, which, acting as a spring, returns this force to the ascending column during the period of the up-stroke, and so, by taking the blow of the entering water, and returning it gradually, equalises the pressure, and renders the discharge uniform. Another method is the double-action force-pump, by which equal volumes of water are forced into the ascending column by both up and down strokes. An example of this is shewn in fig. 5. The solid piston A is worked by a rod B of half the section of the piston itself. During the up-stroke, the upper surface forces a volume of water into the ascending column, and the lower surface draws in twice that volume. In the down-stroke, these two volumes are sent through the pipe E into the receptacle C, communicating with the upper face of the piston. One of the volumes fills the space D, which would otherwise be left empty by the descent of the piston; the other volume is sent into the ascending column; so that a volume of water equal to half the content of the barrel is sent into the ascending column by both the up and the down strokes.

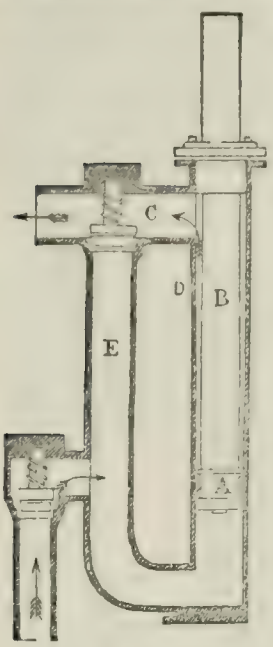

Fig. 5.

A pump of enormous power, simple and economical, has recently been invented by Mr Thos. Shaw, of Phila., and manufactured by the Hydrostatic and Hydraulic Company of Penna. It consists of an iron pipe, in the centre of which revolves a steel shaft, furnished at intervals of three feet with blades or propellers, inclined at an angle of 65°, and revolving with the shaft. Midway between these blades, but attached to the walls of the pipe, are wings or blades of the same pitch, at a reversed angle. On revolving the shaft, a continuous stream of water, 20 inches in diameter, flows from the elevator, at the rate of 10,000 gallons per minute, from a depth of 300 feet. The manufacturers assert that these pumps cost much less and can lift more foot-pounds of water per 100 pounds of coal consumed than other pumps of the same power. For notices of lifting, centrifugal, and turbine pumps, see Machinery, &c., in *The Industrial Arts*, by F. A. P. Barnard, in *Rep. of Am. Com. to the Paris Univ. Exhib.*, Washington, 1870.

In spite of the great antiquity of the lift and force pump, it is only of late years that improvements have been introduced into its construction capable of rendering it an efficient machine—that is, one which returns in the shape of water raised, a good proportion of the power applied to it. In 1849, M. Morin found by experiments that the power lost was 55 to 82 per cent.—that is to say, that of the motive-power, 45 per cent. was yielded in the best and 18 in the worst, giving an average of about 30 per cent. In 1851, the jury, reporting on those exhibited in the Great Exhibition, say that it is one of our worst machines, considered in a mechanical sense, as a means of producing a given result with the least possible expense of power. In those exhibited in the International Exhibition of 1862, we find a marked improvement. The jury report that 'a large number of constructers have sought to give the waterways and valves dimensions which render as small as possible the loss of power by friction. They have also sought to give a continuous movement to the ascending column of water, independently of the action of the reservoir of air.'

3. *The Chain-pump.*—This pump is formed in general of plates of wood fastened to an endless iron chain, and moving upwards in a rectangular case or box. Fig. 6 shews an example of this pump, which was exhibited in the International Exhibition of 1862, called 'Murray's Chain-pump;' a pump which is very much used on public works, on account of

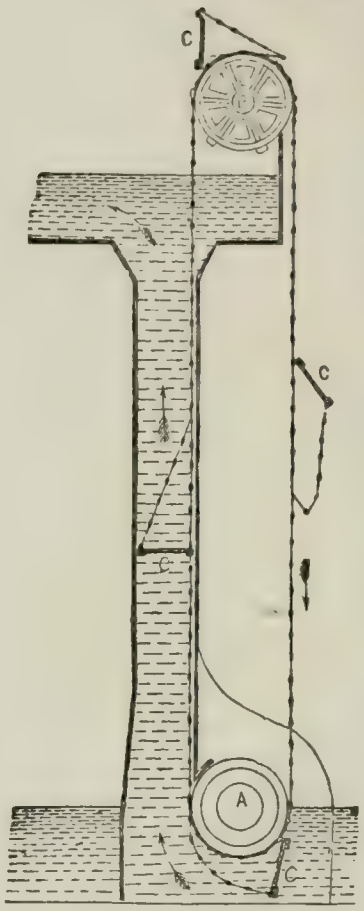

Fig. 6.—Murray's Chain-pump.

the ease of its construction and erection, and its admirable efficiency even at considerable heights. In this pump, the friction is reduced by having only 3 or 4 lifts instead of 20 or 30, as was previously the case. The chains pass under a roller, A, at the foot, and are driven by a small pitch-wheel, B, at the top, over which they are conducted, and which is driven by appropriate gearing. The lifts feather in passing over the wheel to the descending side, and only unfold when brought round to the ascending side; thus the pump is enabled to take off the water with the same dip as other pumps. The pump is not liable to be choked, as a back turn of the chain immediately releases any substance getting between the lift and the barrel. The speed is variable, in proportion to the duty required. The speed at which the chain is ordinarily worked is from 200 to 300 feet per minute. The greatest lift yet made by Murray's chain-pump is 60 feet high; but it is considered that 100 tons of water per minute could be raised 100 feet high. From 10 to 12 feet apart has been found to be the best pitch for the lifts; putting

them nearer, needlessly increases the friction. Experiments made by Mr Lovick for the Metropolitan Board of Works, shewed that the slip of the lifts which work in the barrel, and are one-eighth of an inch shorter each way than the barrel, averaged 20 per cent. of their motion, and that the useful work done averaged 63 per cent. of the indicator horse-power of the engine working it.

4. *The Centrifugal Pump.*—These pumps, with reference to those previously described, may be called new, as, though they have been in use in one form or another for at least a century, their merits were not brought prominently forward till the year 1851, when the great efficiency of the models exhibited by Messrs Appold, Gwynne, and Bessemer drew general attention to the subject.

The essential parts of this pump are—1. The wheel to which the water is admitted at the axis, and from which it is expelled at the circumference, by the centrifugal force due to the rotatory motion imparted to it in passing through the rapidly revolving wheel; and 2. The casing or box in which the wheel works, and by which the entering water is separated from that discharged.

Figs. 7 and 8 are a section and plan of a centrifugal pump. The water enters the pump by the

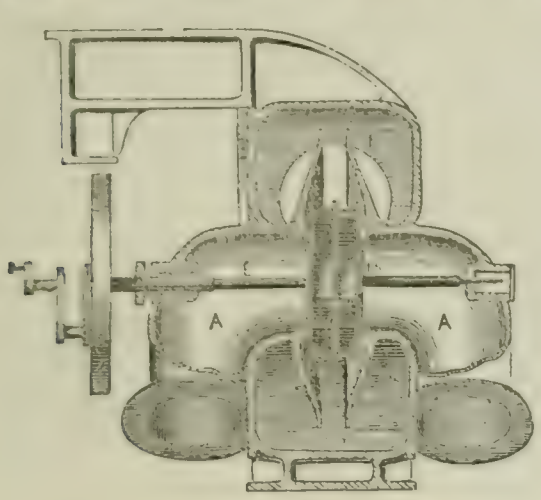

Fig. 7.

supply-pipes A, A, which lead to the central orifices of the wheel B, B; it then passes through the passages C, C, formed by the vanes and the side covering-plates, D, of the wheel. In passing through

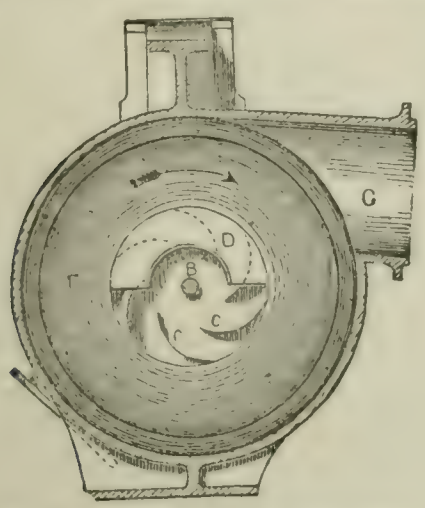

Fig. 8.—Thomson's Centrifugal Pump.

these passages of the wheel, which is made to revolve by power applied to the shaft E, it acquires a rotatory motion, which still continues when it leaves the circumference of the wheel, and enters the circular whirlpool chamber F; so that the interior of the pump may be looked on as a whirlpool, extending from the axle of the wheel to the circumference of the whirlpool chamber. Into this whirlpool the water is drawn at the central orifice of the wheel, and discharged by the pipe G at the circumference of the whirlpool chamber; and the force with which it is discharged, or the height to which it will rise in the pipe G, is measured by the centrifugal force of the water revolving in the whirlpool.

With reference to the efficiency of these pumps, it is impossible to give any accurate estimate, since as high as 70 per cent. of the applied power is claimed to be returned by forms of the pump shewn in figs. 7 and 8, while some other descriptions experimented on in 1851 gave only 18 per cent. of useful effect.

It will be evident, from the above description of the pump, that the height to which the water will be raised depends entirely upon the speed of revolution of the wheel; and it is by this that the application of centrifugal pumps is limited to comparatively low lifts of say less than 20 feet, as the speed for high lifts requires to be greater than can be conveniently and usefully attained in practice. They are best applied when raising large quantities of water through low lifts. It will also be observed, that on account of the simplicity of their parts, and the absence of valves, they are much less liable than other pumps to be choked by the entrance of solid materials. In some descriptions of this pump, the exterior whirlpool chamber is dispensed with; and to the vanes of the wheel is given such a curvature backwards from the direction of motion, that the water leaving the circumference of the wheel is spouted backwards from the vane-passages with a speed equal to that of the wheel in the opposite direction, so that it has only a radial motion with reference to a fixed object; in other words, that the force is acquired from the radial component of the pressure of the vanes, instead of the centrifugal force of the revolving water. Those pumps, however, give the best results which, as the one above described, combine both actions. In all cases, curved vanes are much superior to straight ones.

5. *The Jet-pump.*—This pump is worked by water-power, and is worthy of notice on account of the extreme simplicity of its parts, and of not requiring the care of an attendant while in operation.

Fig. 9 is a representation of this pump, C is the water which it is required to raise to the level of the water D, and B is the water in the stream available for working the pump. The water B passes down the pipe A, and is discharged from the jet or nozzle, E, into the conical pipe F. Round the nozzle is the vacuum-chamber G, at the bottom of which is attached the conical pipe F, and into the side of which the suction-pipe H enters from the water to be pumped. The water, in passing from the nozzle into the conical pipe, carries air with it, and so gradually forms a vacuum in the chamber G, when the water rises into it from the level C, through the pipe H; and it is in turn carried with the jet down the conical pipe into the discharge-level D. The velocity of the water coming from the jet is gradually retarded by the action of the conical pipe, the speed decreasing as the area of section increases; and the *vis viva* of its motion is by this retardation converted into a sucking force, drawing the water from the suction-pipe through the vacuum chamber into the conical pipe. The water issuing from the jet will have a speed equal to that produced by a column of the height BC, or the sum of

the fall and lift. This pump may be viewed, for purposes of explanation, as a syphon, into the shorter leg of which a jet of water is injected,

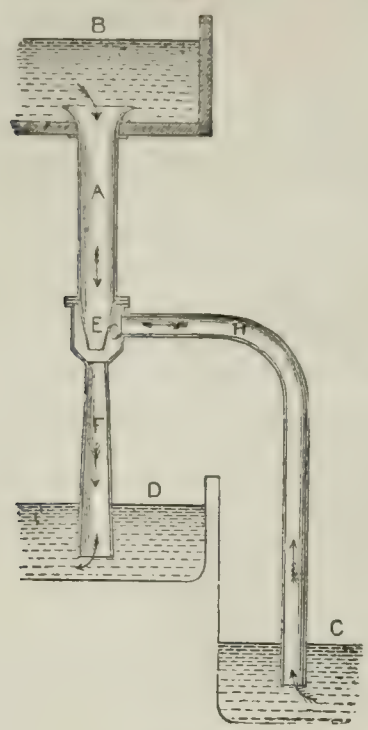

Fig. 9.

which overcomes the pressure due to the difference of levels, and reverses the ordinary motion of the water in a syphon. An efficiency of 18 per cent. has been obtained from this pump, which is low, as compared with that obtained from other descriptions of pump; yet in cases where waste of water-power is not so much to be avoided as expense in erecting, working, and maintenance, these pumps possess decided advantages. The case to which they are peculiarly applicable is the drainage of marshes, which have streams of water adjacent to them descending from a higher level.

PUN is the name given to a play upon words. The wit lies in the equivocal sense of some particular expression, by means of which an incongruous, and therefore ludicrous idea is unexpectedly shot into the sentence. One or two examples will make the matter clearer than any definition. Two persons looking at a beggar-boy with an extraordinary big head—'What a tower!' cried the first. 'Say, rather,' replied the second, 'what a *fort o' lice*' (fortalice).—A noted punster was once asked, with reference to Mr Carlyle's writings, if he did not like 'to expatiate in such a field.' 'No,' was the felicitous rejoinder; 'I can't get over the *style*' (stile).—A Massachusetts lady complaining to a friend that her husband (whose business had taken him to the far West) constantly sent her letters filled with expressions of endearment, but no money, was told, by way of comfort, that he was giving her a proof of his *unremitting* affection!

PUNCH, the chief character in a popular comic exhibition performed by means of *Puppets* (q. v.). Various accounts are given of the origin of the name. The exhibition is of Italian origin, and the Italian name is *Pulcinella*, or *Policinella*. According to one story, a peasant, a well-known character in the market-place of Naples, got the name Pulcinelli from dealing in fowls (*pulcinelli*), and after his death was personated in the puppet-shows of the San-Carlino theatre. Another account makes the word a corruption of Puccio d'Aniello, the name of a witty buffoon of Acerra who joined a company of players and became the favourite of the Neapolitan populace. Others give his original name as Paolo Cinella. The variety and inconsistency of the legends shew them to be myths—histories invented to account for the name. The modern P. is only a modification of an ancient Mask (q. v.) to be seen represented on ancient vases, and taken perhaps from the Oscan Atellanæ; and the Italian name is pretty evidently a diminutive of *pollice*, the thumb—Tom Thumb (the dwarfs of northern mythology are sometimes styled *däumling*, thumkins). The English name *Punch* is apparently identical with Eng. *paunch;* Bavarian *punzen*, a cask; Ital. *punzone*, a puncheon; and denotes anything thick and short (e. g., a Suffolk *punch*). The name *Punchinello* seems to have arisen from blending the English and Italian names.

The drama or play in which the modern P. figures, is ascribed to an Italian comedian, Silvio Fiorillo, about 1600. The exhibition soon found its way into other countries, and was very popular in England in the 17th century. Its popularity seems to have reached its height in the time of Queen Anne, and Addison has given in the *Spectator* a regular criticism of one of the performances. The scenes as now given by the itinerant exhibiters of the piece are much shortened from what were originally performed, in which allusions to public events of the time were occasionally interpolated. The following is an outline of the plot as performed in 1813. Mr P., a gentleman of great personal attraction, is married to Mrs Judy, by whom he has a lovely daughter, but to whom no name is given in this piece, the infant being too young to be christened. In a fit of horrid and demoniac jealousy, P., like a second Zeluco, strangles his beauteous offspring. Just as he has completed his dreadful purpose, Mrs Judy enters, witnesses the brutal havoc, and *exit* screaming; she soon returns, however, armed with a bludgeon, and applies it to her husband's head, 'which to the wood returns a wooden sound.' P. at length exasperated seizes another bludgeon, soon vanquishes his already-weakened foe, and lays her prostrate at his feet; then seizing the murdered infant and the expiring mother, he flings them both out of the window into the street. The dead bodies having been found, police-officers enter the dwelling of P., who flies for his life, mounts his steed; and the author neglecting, like other great poets, the confining unities of time and place, conveys his hero into Spain, where, however, he is arrested by an officer of the terrible Inquisition. After enduring the most cruel tortures with incredible fortitude, P., by means of a golden key, opens his prison-door, and escapes. The conclusion of the story is satirical, allegorical, and poetical. The hero is first overtaken by Weariness and Laziness in the shape of a black dog, which he fights and conquers; Disease, in the disguise of a physician, next arrests him; but P. 'sees through the thin pretence,' and dismisses the doctor with a few derogatory kicks. Death at length visits the fugitive; but P. lays about his skeleton carcass so lustily, and makes the bones of his antagonist rattle so musically with a bastinado, that 'Death his death's blow then received.' Last of all comes the Devil; first under the appearance of a lovely female, but afterwards in his own natural shape, to drag the offender to the infernal regions, to expiate his dreadful crimes. Even this attempt fails, and P. is left triumphant over Doctors, Death, and the Devil. The curtain falls amid the shouts of the conqueror, who, on his victorious staff, lifts on high his vanquished foe.

The well-marked peculiarities in the original personification of P., which were a high back, distorted breast, and long nose, were intended to give an increased zest to his witticisms; but these features have been much exaggerated in the now so well-known illustrations of the popular periodical which bears his name.

The performance of P., as generally represented, requires the assistance of only two persons—one to carry the theatre and work the figures, the other

to bear the box of puppets, blow the trumpet, and sometimes keep up the dialogue with the hero of the piece. The movements of the puppets are managed simply by putting the hands under the dress, making the second finger and thumb serve for the arms, while the forefinger works the head.

PUNCH, a beverage introduced into England from India, and so called from being usually made of five (Hindu, *pantsh*) ingredients—arrack, tea, sugar, water, and lemon-juice. As now prepared, punch may be described as a drink, the basis of which is alcohol, of one or more kinds, diluted with water, flavoured with lemon or lime-juice and spices, and sweetened with sugar; sometimes other ingredients are added according to taste, especially wine, ale, and tea. The mixture is usually compounded in a large china bowl made for the purpose, and is served out in glasses by means of a ladle. It is much more rarely seen now than formerly, which is not to be regretted, for a more unwholesome or intoxicating beverage could hardly be compounded. The ordinary mixed punch consists of the following ingredients: the juice of three lemons squeezed out into a large jug, and one lemon cut into slices, with the rind on for flavour, twelve ounces of loaf-sugar, and two quarts of boiling water; after being infused half an hour, and strained off, the liquid is poured into the punch-bowl, and half a pint of rum and of brandy are added. A favourite mode of drinking this composition at present is as a liqueur after fish at dinner, for which purpose it is bottled, and when wanted, is iced, either by placing the bottles in rough ice, or by pounding and mixing in fine ice. The principal varieties of punch, in addition to this, are rum, gin, and brandy punches, in which only one of the spirits mentioned is used, and champagne, milk, orange, raspberry, tea, wine punches.

PUNCH, a tool for cutting circular or other shaped pieces out of metal, wood, or other materials. The simplest form of this instrument is shewn in fig. 1, which consists of a piece of steel

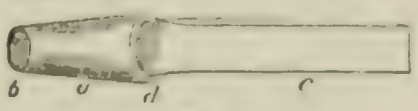

Fig. 1.

formed at one end into a hollow cylinder, *a*, the end of which at *b* is ground to a very sharp cutting edge. The other end of the punch at *c* is made strong and thick, to receive blows from a hammer, and to serve as a handle. When the instrument is in use, the cutting-edge, *a*, is applied to the surface which is to be perforated, and a blow sufficiently hard is struck on the end of the handle, *c*, when a circular piece of the material is cut out and left in the hollow part, *a*, which can be removed at the upper end of the opening at *d*. The mode of manufacturing such tools is very simple. A piece of square steel-bar is taken, the thickness of which must correspond with the thickness of the handle at *c*, fig. 1, for which fig. 2 may be taken as the

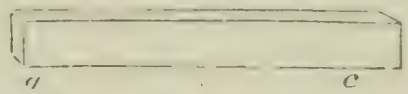

Fig. 2.

commencement. This is brought up to a sufficient heat in the furnace, and is then beaten or rolled laterally so as to have the shape in fig. 3. In the

Fig. 3.

next stage, the edges, *a*, *a*, fig. 4. are brought up: and finally, a mandril is put into the groove thus made, and the edges are brought together, and welded:

Fig. 4.

the mandril is then withdrawn, and the tool goes to be ground and finished. It will be obvious that, by skill, punches may be made which will make holes of almost any shape. The enormous development of our iron manufactures has necessitated the use of machine-tools in the place of those made for the hand, and none of the very ingenious inventions for this purpose have played a much more important part than the *punching-machines*, for without them the labour of drilling holes in iron plates for such objects as steam-boilers, iron ships, bridges, and other great works, would have been so great as to have effectually prevented them from being

undertaken. The punching-machine invented by Messrs Roberts and Nasmyth, with recent modifications and improvements, is in very general use in all our great engineering works; its essential parts are the punch, lever, and the spring. The punch is simply a piece of tough, hard steel of a cylindrical form, and of the size of the intended holes; it fits into a socket, which is suspended over a fixed iron plate or bench, which has a hole exactly under the punch, and exactly fitting it. In the socket which holds the punch is a coiled iron spring, which holds up the punch, and allows it to descend when the power is applied, and returns it when the pressure is relieved. The lever, when in action, presses on the top of the punch, and the plate of metal which is to be perforated being placed on the iron bench, receives the pressure of the punch with sufficient force to press out a disc of metal exactly the diameter of the punch, which falls through the hole in the iron bench. The lever is moved by a cam on a powerful wheel, which presses upon it until it can pass; then the lever being relieved, the punch is drawn up by the spring in its socket, ready to receive the action of the cam when the revolution of the wheel again brings it to bear on the lever. The punch itself is always solid, differing entirely in this respect from the hand-tools. This useful machine will perforate thick plates of iron, such as are used for shipbuilding, almost as quickly as a workman with an ordinary hand-punch could perforate thin plates of tin; the holes made are quite true, and are ready to receive the rivets.

PUNCTUA'TION, the division of a writing into sentences, and the subdivision of these into parts by means of certain marks called *points*, a great help to the clear exhibition of the meaning and to the pleasant reading of what is written. The ancients were not acquainted with the use of points, or used them very little, and only for oratorical purposes. Punctuation, according to the grammar and sense, is said to have been an invention of the Alexandrian grammarian, Aristophanes; but was so much neglected and forgotten, that Charlemagne found it necessary to ask Warnefried and Alcuin to restore it. It consisted at first of a point called the *stigma*, and sometimes a line, variously formed and introduced. The system of punctuation now in use was introduced by the Venetian printer, Manutius, in the latter part of the 15th c.; the example was soon and generally followed, and little change has since been found requisite.

PU'NDLER, the name which in Scotland used to be given to a person employed on an estate as hedger, ditcher, forester, and general guardian, in absence of the proprietor. The office of a pundler was probably analogous to that of poynder. In a few cases, the term pundler is still employed.

PU'NIC WARS, the name commonly given to the three great wars waged for supremacy between Rome and Carthage. The Latin word *punicus*, or *pœnicus*, was the name given by the Romans to the Carthaginians, in allusion to their Phœnician descent. For an outline of the struggle between the two rival powers, see CARTHAGE, ROME, HAMILCAR, HANNIBAL, and the SCIPIOS.—The Romans, who believed, not without reason, that the Carthaginians never sincerely meant to keep any treaty of peace, employed the phrase *punica fides*, 'Punic faith,' to denote a false and faithless spirit.

PU'NICA. See POMEGRANATE.

PU'NISHMENT, in Great Britain, usually means the deprivation of property or liberty, or the infliction of pain on the body of one who commits a criminal offence. It is not applicable, generally, to civil actions, though these are also followed with the compulsory payment of money, and failing which, with the deprivation of property and liberty. As the legal consequence of crimes, punishment consists chiefly of the infliction of pain on the body, and this ranges from capital punishment or death, down to imprisonment for a term of years, and, in some cases, whipping is added; and in military and naval offences, flogging. Capital punishment is inflicted only in case of treason and murder (but there are other instances under naval or army discipline), and in the form of Hanging (q. v.). In crimes of less degree, imprisonment, or Penal Servitude (q. v.) for a term of years, is the punishment. As a general rule, the judge has a discretion to fix the punishment within two defined limits. In the great mass of the smallest crimes, which are cognisable by justices of the peace, and are frequently termed offences punishable summarily, the usual punishment is a fine or penalty, i. e., a sum of money is ordered to be paid by the offender, and if he do not pay it, his goods are sold to make up the sum; failing which, he is committed to the house of correction for a short period of 3, 6, or 12 months; but, in some of the cases, imprisonment and hard labour are imposed in lieu of a fine. The crown can put an end to a sentence of punishment by a free pardon, or may commute a sentence of death to imprisonment for life.

PUNISHMENT, FUTURE. See HELL.

PUNISHMENTS, MILITARY AND NAVAL, of the United States army, by sentence of court-martial, are—death; confinement; confinement on bread-and-water diet, not exceeding 14 days; solitary confinement, not exceeding 14 days, with intervals, in both cases, of not less than the same period; hard labour; ball and chain; forfeiture of pay and allowances, discharge from the service, and reprimand; and, when a non-commissioned officer, reduction to the ranks. The commander of a vessel of the navy cannot inflict any other punishment upon a commissioned or warrant officer except a private reprimand, suspension from duty, arrest, or confinement, neither of which can continue longer than 10 days, except a longer term be necessary to bring the offender to a court-martial, nor upon petty officers, &c. any punishment except a reduction in any rating of his own establishing, confinement with or without irons, solitary confinement, deprivation of liberty on shore, and extra duties.

PU'NJAB (the *Pentapotamia* of the Greeks, derives its name from two Persian words, signifying 'five rivers') is an extensive territory in the north-west of Hindustan, watered by the Indus, and its five great affluents—the Jhelum, Chenab, Ravi, Beas, and Sutlej, and forms a British possession since February 1849. It is bounded on the W. by the Suliman Mountains, on the N. by Cashmere, and on the E. and S.E. by the Sutlej, which, in its lower course, is called the Ghara. In shape, the territory of the P. resembles an isosceles triangle, the apex of which is at the junction of the Indus and the Punjnud, in lat. about 29° N.; and the base, about 450 miles in length, runs along the Himalayas. The sides are about 600 miles in length. According to the latest returns published in the last statistical tables from official tables in *The Statesman's Year-Book* for 1871, the area of the Punjab is 193,645 square miles; and the population 22,680,448. The physical character of the northern contrasts strikingly with that of the southern districts. In the north, the whole surface is traversed by spurs from the Himalayas, which enclose deep valleys. In the south, the surface is unbroken by any important eminence, with the exception of the Salt Range, about 2000 feet high, between the Indus and the Jhelum. The country, divided into five doabs

or interfluvial tracts, and frequently spoken of as the plains of the Indus, has a general slope towards the south-west. The climate in the plains is most oppressively hot and dry in summer, indicating in Lahore 112°, in a tent artificially cooled; but cool, and sometimes frosty, in winter. Little rain falls except in the districts along the base of the Himalayas. The soil varies from stiff clay and loam to sand; but, in general, is sandy and barren, intermixed with fertile spots. The rivers afford abundant means of irrigation. The indigenous vegetation of the P. is meagre. Trees are few in number and small, and fuel is so scarce, that cow-dung is much used in its stead. With an efficient system of agriculture, however, the territories of this part of India might be rendered very productive. Of the ordinary crops, wheat of excellent quality is produced in considerable quantities, and indigo, sugar, cotton, tobacco, opium, buckwheat, rice, barley, millet, maize, and numerous vegetables and fruits are grown. The manufacturing industry of this region is very considerable, and is carried on for the most part in the great towns, as Amritsir (q. v.), Lahore (q. v.), Multan (q. v.), &c. Spices and other groceries, dye-stuffs, cloths, metals, and hardware, are imported from the more eastern provinces of British India; and grain, ghee, hides, wool, carpets, shawls, silk, cotton, indigo, tobacco, salt, and horses are exported. The inhabitants are of various races, chiefly Jats, Gujurs, Rajputs, and Patans. Two-thirds of the whole population are Moslems, and of the remaining third, one half are Hindus, and the other half Sikhs. The Jats are the most prominent of the races of the P., and are said to have formed the 'core and nucleus' of the Sikh nation and military force. Of the history of the P., all that is important will be given under the heading SIKHS.

PU'NKAH, a gigantic fan for ventilating apartments, used in India and tropical climates. It consists of a light frame of wood, covered with calico, from which a short curtain depends, and is suspended by ropes from the ceiling; another rope from it passes over a pulley in the wall to a servant stationed without; the servant pulls the punkah backwards and forwards, maintaining a constant current of air in the chamber.

PUNT, a heavy, oblong, flat-bottomed boat, useful where stability and not speed is needed. Punts are much used for fishing. Some are fitted for oars; but the more usual mode of propulsion is by poles operating on the bottom. Punting is a very laborious exercise.

PUOZZOLA'NO. See CEMENTS.

PU'PA (Lat. a girl, or a doll), the second stage of insect life after the hatching of the egg. The first stage after the egg is that of *Larva* (q. v.). In those insects of which the metamorphosis is *complete* (see INSECTS), the pupa is generally quite inactive, and takes no food. This is the case in the *Lepidoptera*, the pupa of which is called a *Chrysalis* or *Aurelia*, and in the *Coleoptera*, *Hymenoptera*, and *Diptera*. Manifestations of life may indeed be produced by touching, or in any way irritating, the pupa, but it is incapable of locomotion and of eating. It is quite otherwise with the pupæ of other orders, which are often very voracious, and resemble the perfect insect in almost everything but that the wings are wanting. The peculiarities of the pupa are noticed in the articles on the different orders and genera of insects.

PUPIL. See EYE.

PUPIL, in the Law of Scotland, means, in the case of a male, one who is under 14 years of age; in the case of a female, one under the age of 12 years.

PU'PPET, a name (derived from the Lat. *pupus*, a child or boy, Fr. *poupée*, a doll) signifying a child-like image. The Italian *fantoccini* (from *fantino*, a child), and the French *Marionettes* (q. v.) are other names for puppets. Puppet-plays, or exhibitions in which the parts of the different characters are taken by miniature figures worked by wires, while the dialogue is given by persons behind the scenes, are of very ancient date. Figures with movable limbs have been found in the tombs of ancient Egypt and Etruria. Originally intended to gratify children, they ended in being a diversion for adults. In China and India they are still made to act dramas either as movable figures or as shadows behind a curtain ('Ombres Chinoises'). In Italy and France puppet-plays were at one time carried to a considerable degree of artistic perfection, and even Lessing and Göethe in Germany thought the subject worth their serious attention. In England, they are mentioned under the name of *Motions* by many of our early authors, and frequent allusions occur to them in the plays of Shakspeare, Ben Jonson, and the older dramatists. The earliest exhibitions of this kind consisted of representations of stories taken from the Old and New Testament, or from the lives and legends of saints. They thus seem to have been the last remnant of the *Moralities* of the 15th century. We learn from Ben Jonson and his contemporaries that the most popular of these exhibitions at that time were the *Prodigal Son*, and *Nineveh, with Jonas and the Whale*. Even the Puritans, with all their hatred of the regular stage, did not object to be present at such representations. In the reign of Queen Elizabeth, puppet-plays were exhibited in Fleet Street and Holborn Bridge—localities infested by them at the period of the Restoration. The most noted exhibitions of the kind were those of Robert Powel in the beginning of the 18th century. (See Chambers's *Book of Days*, vol. ii. 167.) So recently as the time of Goldsmith, scriptural 'Motions' were common, and, in *She Stoops to Conquer*, reference is made to the display of Solomon's Temple in one of these shows. The regular performances of the stage were also sometimes imitated; and Dr Samuel Johnson has observed, that puppets were so capable of representing even the plays of Shakspeare, that *Macbeth* might be represented by them as well as by living actors. These exhibitions, however, much degenerated, and latterly consisted of a wretched display of wooden figures barbarously formed, and decorated without the least degree of taste or propriety, while the dialogues were jumbles of absurdities and nonsense.

The mechanism of puppet-plays is simple. The exhibiter is concealed above or below the stage, works the figures by means of wires, and delivers the dialogues requisite to pass between the characters. The exhibition of Punch (q. v.) is perhaps the only example of this species of acting which exists in this country at the present time.

PURÂN'A (literally 'old,' from the Sanscrit *purâ*, before, past) is the name of that class of religious works which, besides the Tantras (q. v.), is the main foundation of the actual popular creed of the Brahminical Hindus (see HINDU RELIGION under INDIA). According to the popular belief, these works were compiled by *Vyâsa* (q. v.), the supposed arranger of the *Vedas* (q. v.), and the author of the *Mahâbhârata* (q. v.), and possess an antiquity far beyond the reach of historical computation. A critical investigation, however, of the contents of the *existing* works bearing that name must necessarily

lead to the conclusion, that in their present form they do not only not belong to a remote age, but can barely claim an antiquity of a thousand years. The word *Purân'a* occurs in some passages of the *Mahâbhârata*, the law-books of Yâjnavalkya and Manu (q. v.); it is even met with in some *Upanishads* and the great Brâhman'a portion of the White-Yajur-Veda; but it is easy to shew that in all these ancient works it cannot refer to the existing compositions called P., and therefore that no inference relative to the age of the latter can be drawn from that of the former, whatever that may be. Nevertheless, it must be admitted that there are several circumstances tending to shew that there existed a number of works called P., which preceded the actual works of the same name, and were the source whence these probably derived a portion of their contents. The oldest known author of a Sanscrit vocabulary, Amara-Sinha, gives as a synonym of P. the word *Pancha-lakshan'a*, which means 'that which has five (*panchan*) characteristic marks' (*lakshan'a*); and the scholiasts of that vocabulary agree in stating that these *lakshan'as* are: 1. Primary creation, or cosmogony; 2. Secondary creation, or the destruction and renovation of worlds; 3. Genealogy of gods and patriarchs; 4. *Manwantaras*, or reigns of Manus; and 5. The history of the princes of the solar and lunar races. Such, then, were the characteristic topics of a P. at the time, if not of Amara-Sinha himself—which is probable—at least of his oldest commentators. Yet the distinguished scholar most conversant with the existing Purân'as, who, in his preface to the translation of the *Vishn'u-P.*, gives a more or less detailed account of their chief contents (Professor H. H. Wilson), observes, in regard to the quoted definition of the commentators on Amara-Sinha, that in no one instance do the actual Purân'as conform to it exactly; that 'to some of them it is utterly inapplicable; to others, it only partially applies.' To the *Vishn'u-P.*, he adds, it belongs more than to any other P.; but even in the case of this P. he shews that it cannot be supposed to be included in the term explained by the commentators. The age of Amara-Sinha is, according to Wilson, the last half of the century preceding the Christian era; others conjecture that it dates some centuries later. On the supposition, then, that Amara-Sinha himself implied by Pancha-lakshan'a the sense given to this term by his commentators, there would have been Purân'as about 1900 or 1600 years ago; but none of these have descended to our time in the shape it then possessed.

Various passages in the actual Purân'as furnish proof of the existence of such elder Purân'as. The strongest evidence in this respect is that afforded by a general description given by the *Matsya-P.* of the extent of each of the Purân'as (which are uniformly stated to be 18 in number), including itself; for, leaving aside the exceptional case in which it may be doubtful whether we possess the complete work now going by the name of a special P., Professor Wilson, in quoting the description from the *Matsya-P.*, and in comparing with it the real extent of the great majority of Purân'as, the completeness of which, in their actual state, does not admit of a reasonable doubt, has conclusively shewn that the *Matsya-P.* speaks of works which are not those we now possess. We are then bound to infer that there have been Purân'as older than those preserved, and that their number has been 18, whereas, on the contrary, it will be hereafter seen that it is very doubtful whether we are entitled to assign this number to the actual P. literature.

The modern age of this latter literature, in the form in which it is known to us, is borne out by the change which the religious and philosophical ideas, taught in the epic poems and the philosophical Sûtras, have undergone in it; by the legendary detail into which older legends and myths have expanded; by the numerous religious rites—not countenanced by the Vedic or epic works—which are taught, and, in some Purân'as at least, by the historical or quasi-scientific instruction which is imparted, in it. To divest that which, in these Purân'as, is ancient, in idea or fact, from that which is of parasitical growth, is a task which Sanscrit philology has yet to fulfil; but even a superficial comparison of the contents of the present P. with the ancient lore of Hindu religion, philosophy, and science, must convince every one that the picture of religion and life unfolded by them is a caricature of that afforded by the Vedic works, and that it was drawn by priestcraft, interested in submitting to its sway the popular mind, and unscrupulous in the use of the means which had to serve its ends. The plea on which the composition of the Purân'as was justified even by great Hindu authorities—probably because they did not feel equal to the task of destroying a system already deeply rooted in the national mind, or because they apprehended that the nation at large would remain without any religion at all, if, without possessing the Vedic creed, it likewise became deprived of that based on the Purân'as—this plea is best illustrated by a quotation from Sâyan'a, the celebrated commentator on the three principal *Vedas*. He says (*Rigv.*, ed. Müller, vol. i. p. 33): 'Women and S'ûdras, though they, too, are in want of knowledge, have no right to the Veda, for they are deprived of (the advantage of) reading it in consequence of their not being invested with the sacred cord; but the knowledge of law (or duty) and that of the supreme spirit arises to them by means of the Purân'as and other books (of this kind).' Yet to enlighten the Hindu nation as to whether or not these books—which sometimes are even called a fifth Veda—teach that religion which is contained in the *Vedas* and *Upanishads*, there would be no better method than to initiate such a system of popular education as would reopen to the native mind those ancient works, now virtually closed to it.

Though the reason given by Sâyan'a, as clearly results from a comparison of the Purân'as with the oldest works of Sanscrit literature, is but a poor justification of the origin of the former, and though it is likewise indubitable, that even at his time (the middle of the 15th c. A.D.), they were, as they still are, not merely an authoritative source of religion for 'women and S'ûdras,' but for the great majority of the males of other castes also, it nevertheless explains the great variety of matter of which the present Purân'as are composed, so great and so multifarious indeed, that, in the case of some of them, it imparts to them a kind of cyclopædical character. They became, as it seems, the source of all popular knowledge; a substitute to the masses of the nation, not only for the theological literature, but for scientific works, the study of which was gradually restricted to the leisure of the learned few. Thus, while the principal subjects taught by nearly all the P. are cosmogony, religion, including law, and the legendary matter which, to a Hindu, assumes the value of history, in some of them we meet with a description of places, which gives to them something of the character of geography; while one, the *Agni-P.*, also pretends to teach archery, medicine, rhetoric, prosody, and grammar; though it is needless to add that that teaching has no real worth.

One purpose, however, and that a paramount one, is not included in the argument by which Sayana endeavoured to account for the composition of the Purânas—it is the purpose of establishing a sectarian creed. At the third phase of Hindu Religion (q. v.), two gods of the Hindu pantheon especially engrossed the religious faith of the masses, Vishn'u (q. v.) and S'iva (q. v.), each being looked upon by his worshippers as the supreme deity, to whom the other as well as the remaining gods were subordinate. Moreover, when the power or energy of these gods had been raised to the rank of a separate deity, it was the female S'akti, or energy, of S'iva, who, as Durgâ, or the consort of this god, was held in peculiar awe by a numerous host of believers. Now, apart from the general reasons mentioned before, a principal object, and probably *the* principal one of the Purân'as, was to establish, as the case might be, the supremacy of Vishn'u or S'iva, and it may be likewise assumed of the female energy of S'iva, though the worship of the latter belongs more exclusively to the class of works known as Tantras. There are, accordingly, Vaishn'ava-Purân'as, or those composed for the glory of Vishn'u, S'aiva-P., or those which extol the worship of S'iva; and one or two Purân'as, perhaps, but merely so far as a portion of them is concerned, will be more consistently assigned to the S'âkta worship, or that of Durgâ, than to that of Vishn'u or S'iva.

'The invariable form of the Purân'as,' says Professor Wilson, in his *Preface to the Vishn'u-Purâ'a*, 'is that of a dialogue in which some person relates its contents in reply to the inquiries of another. This dialogue is interwoven with others, which are repeated as having been held, on other occasions, between different individuals, in consequence of similar questions having been asked. The immediate narrator is commonly, though not constantly, Lomaharshan'a, or Romaharshan'a, the disciple of Vyâsa, who is supposed to communicate what was imparted to him by his preceptor, as he had heard it from some other sage. . . . . Lomaharshan'a is called Sûta, as if it was a proper name; but it is, more correctly, a title; and Lomaharshan'a was "a Sûta," that is, a bard or panegyrist, who was created, according to the *Vishn'u-Purân'a*, to celebrate the exploits of princes, and who, according to the *Vâyu* and *Padma Purân'as*, has a right, by birth and profession, to narrate the Purân'as, in preference even to the Brahmans.'

The number of the actual Purân'as is stated to be 18, and their names, in the order given, are the following: 1. *Brahma-*; 2. *Padma-*; 3. *Vishn'u-*; 4. *S'iva-*; 5. *Bhâgavata-*; 6. *Nâradiya-*; 7. *Mârkan'd'eya-*; 8. *Agni-*; 9. *Bhavishya-*; 10. *Brahmavaivartta-*; 11. *Linga-*; 12. *Varâha-*; 13. *Skanda-*; 14. *Vâmana-*; 15. *Kûrma-*; 16. *Matsya-*; 17. *Garud'a-*; and 18. *Brahmân'da-Purân'a*. In other lists, the *Agni-P.* is omitted, and the *Vâyu-P.* inserted instead of it; or the *Garud'a* and *Brahmân'da* are omitted, and replaced by the *Vâyu* and *Nr'isinha Purân'as*. Of these Purân'as, 2, 3, 5, 6, 10, 12, 17, and probably 1, are Purân'as of the Vaishn'ava sect; 4, 8, 11, 13, 15, 16, of the S'aiva sect; 7 is, in one portion of it, called Devîmâhâtmya, the text-book of the worshippers of Durgâ; otherwise, it has little of a sectarian spirit, and would therefore neither belong to the Vaishn'ava nor to the S'aiva class; 14, as Professor Wilson observes, 'divides its homage between S'iva and Vishn'u with tolerable impartiality; it is not connected, therefore, with any sectarial principles, and may have preceded their introduction.' The *Bhavishya-P.* (9), as described by the *Matsya-P.*, would be a book of prophecies; but the *Bhavishya-P.* known to Professor Wilson consists of five books, four of which are dedicated to the gods Brahmâ, Vishn'u, S'iva, and Twashtri; and the same scholar doubts whether this work could have any claim to the name of a P., as its first portion is merely a transcript of the words of the first chapter of Manu, and the rest is entirely a manual of religious rites and ceremonies. There are similar grounds for doubt regarding other works of the list.

If the entire number of works, nominally, at least, corresponding with those of the native list, were taken as a whole, their contents might be so defined as to embrace the five topics specified by the commentators on the glossary of Amara-Sinha; philosophical speculations on the nature of matter and soul, individual as well as supreme; small codes of law; descriptions of places of pilgrimage; a vast ritual relating to the modern worship of the gods; numerous legends; and, exceptionally, as in the *Agni-P.*, scientific tracts. If taken, however, individually, the difference between most of them, both in style and contents, is so considerable that a general definition would become inaccurate. A short description of each P. has been given by the late Professor H. H. Wilson, in his preface to his translation of the *Vishnu-P.*; and to it, as well as to his detailed account of some Purân'as in separate essays (collected in his works), we must therefore refer the reader who would wish to obtain a fuller knowledge of these works.—The age of the P., though doubtless modern, is uncertain. The *Bhâgavata*, on account of its being ascribed to the authorship of the grammarian Vopadeva, would appear to yield a safer computation of its age than the rest; for Vopadeva lived in the 12th c., or, as some hold, 13th c., after Christ; but this authorship, though probable, is not proved to a certainty. As to the other Purân'as, their age is supposed by Professor Wilson to fall within the 12th and 17th centuries of the Christian era, with the exception, though, of the *Mârkan'd'eya-P.*, which, in consideration of its unsectarian character, he would place in the 9th or 10th century. But it must be borne in mind that all these dates are purely conjectural, and given as such by the scholar whose impressions they convey.

Besides these eighteen Purân'as or great Purân'as, there are minor or *Upapurân'as*, 'differing little in extent or subject from some of those to which the title of Purân'a is ascribed.' Their number is given by one Purân'a as four; another, however, names the following 18: 1. *Sanatkumâra-*; 2. *Nârasinha-*; 3. *Nâradiya-*; 4. *S'iva-*; 5. *Durvâsasa-*; 6. *Kâpi'la-*; 7. *Mânava-*; 8. *Aus'anasa-*; 9. *Vârun'a-*; 10. *Kâlikâ-*; 11. *S'âmba-*; 12. *Nandi-*; 13. *Saura-*; 14. *Pârâs'ara-*; 15. *Âditya-*; 16. *Mâhes'vara-*; 17. *Bhâ'avata-* (probably, however, a misreading for *Bhârgava*); and 18. *Vâs'ishtha-Upapurân'a*. Another list, differing from the latter, not in the number, but in the names, of the Upapurân'as, is likewise given in Professor Wilson's *Preface to the Vishn'u-Purân'a*. Many of these Upapurân'as are apparently no longer procurable, while other works so called, but not included in either list, are sometimes met with; for instance, a *Mudgala* and *Ganes'a* Upapurân'a. The character of the Upapurân'as is, like that of the Purân'as, sectarian; the *S'iva-Upapurân'a*, for instance, inculcates the worship of S'iva, the *Kalikâ-Upapurân'a* that of Durgâ or Devî.

Both Purânas and Upapurânas are for a considerable portion of their contents largely indebted to the two great epic works, the *Mahâbhârata* (q. v.) and *Râmâyan'a* (q. v.), more especially to the former of them. Of the Purân'as, the original text of three has already appeared in print: that of the *Bhâgavata* in several native editions, published at Bombay, with the commentary of S'ridharaswâmin, and

partly in a Paris edition by Eugène Burnouf, which remained incomplete through the premature death of that distinguished scholar; that of the *Mârkan'd'eya-P.*, edited at Calcutta in the *Bibliotheca Indica*, by the Rev. K. M. Banerjea; and that of the *Linga-P.*, edited at Bombay: for, regarding a fourth, the *Garud'a-P.*, edited at Benares and Bombay, it seems doubtful whether that little work is the same as the P. spoken of in the native list. Besides these, small portions from the *Padma*, *Skanda*, *Bhavishyottara*, *Mârkan'd'eya*, and other Purân'as have been published in India and Europe. Of translations, we have only to name the excellent French translation by Burnouf of the first nine books of the *Bhâgavata*, and the elegant translation of the whole *Vishn'u-P.*, together with valuable notes by the late Professor H. H. Wilson, which is now in the course of republication in his works, in a new edition, amplified with numerous notes, by Professor F. E. Hall.—For general information on the character and contents of the Purân'as, see especially Wilson's preface to his translation of the *Vishn'u-P.* (Works, vol. vi., Lond. 1864), Burnouf's preface to his edition of the *Bhâgavata* (Paris, 1840), Wilson's *Analysis of the Purân'as* (Works, vol. iii. Lond. 1864, edited by Professor R. Rost), K. M. Banerjea's *Introduction to the Mârkan'd'eya* (Calcutta, 1862), and John Muir's *Original Sanscrit Texts on the Origin and History of the People of India*, vols. 1—4 (Lond. 1858—1863).

PURBECK, Isle of, a district in the south of Dorsetshire, 14 miles in length from west to east, and 7 miles in breadth, is bounded on the N. by the river Frome and Poole Harbour, on the E. and S. by the English Channel, and on the W. by the stream of Luckford Lake, which, rising in the park of Lulworth Castle, flows north, and joins the Frome. On the west, however, the water-boundary is not complete, the district being connected with the main portion of the county at East Lulworth; and the so-called Isle of P. is therefore really a peninsula. In ancient times, the Isle of P. was a royal deer-forest. See Purbeck Beds and Purbeck Marble.

PURBECK BEDS, a group of strata forming the upper members of the Oolitic Period (q. v.), and so named because they are well developed in the peninsula called the Isle of Purbeck (q. v.), south of Poole Estuary in Dorsetshire. They are, like the Wealden beds above them, chiefly fresh-water formations, but their organic remains join them more closely to the marine-formed Oolites below, than to the superior Wealden series. Though of a very limited geographical extent, the Purbeck beds have yet considerable importance, from the changes in animal life that took place during their deposition. Generally less than 200 feet in thickness, they, however, exhibit three distinct and peculiar sets of animal remains. This has caused them to be arranged into three corresponding groups, known as the Upper, Middle, and Lower Purbecks.

The Upper Purbecks are entirely fresh-water, and the strata are largely charged with the remains of shells and fish; the cases of the Entomostraca Cyprides are very abundant and characteristic. The building-stone called Purbeck Marble belongs to this division.

The Middle Purbecks record numerous changes during their deposition. The newest of the strata consists of fresh-water limestone, with the remains of Cyprides, turtles and fish. This rests on brackish water-beds—Cyrena with layers of Corbula and Melania. Below this, there are marine strata, containing many species of sea-shells. Then follow some fresh and brackish-water limestone and shales, which again rest on the cinder-bed, a marine argillaceous deposit containing a vast accumulation of the shells of a small oyster. This is preceded by fresh-water strata, abounding in the remains of Entomostraca, and containing some beds of cherty limestone, in which little bodies, believed to have been the spore-cases of species of Chara, have been found. At the base of this sub-group, a marine shale occurs, containing shells and impressions apparently of a large Zostera.

The Lower Purbecks begin with a series of fresh-water marls, containing Entomostraca and shells. These rest on strata of brackish-water origin; and then follows a singular old vegetable soil, containing the roots and stools of Cycads, and the stems of coniferous trees. From its black colour and incoherent condition, this layer has received from the quarrymen the name of the 'Dirt-bed' (q. v.). This rests on the basement bed of the whole group, which is a fresh-water limestone, charged with Entomostraca and shells, and contains the thin layer in which Mr Beckles has lately found the remains of several species of mammalia.

PURBECK MARBLE is an impure fresh-water limestone, containing immense numbers of the shells of Paludina, from which it derives its 'figure' when polished. It was formerly much used in the internal decoration of churches and other buildings in the southern counties of England. It is quarried in the peninsula of Purbeck, in Dorsetshire, and belongs to the upper section of the Purbeck Beds (q. v.).

PURCELL, Henry, the most eminent of English musicians, was born at Westminster in 1658, and was son of Henry Purcell, one of the gentlemen of the Chapel-royal appointed at the Restoration. He lost his father at the age of six, and was indebted for his musical training to Cook, Humphreys, and Dr Blow. His compositions at a very early age shewed evidence of talent. In 1676, he was chosen to succeed Dr Christopher Gibbons as organist of Westminster Abbey; and in 1682 he was made organist of the Chapel-royal. He wrote numerous anthems and other compositions for the church, which were eagerly sought after for the use of the various cathedrals, and have retained their place to the present day. P.'s dramatic and chamber compositions are even more remarkable. Among the former may be mentioned his music to the *Tempest*, his songs in Dryden's *King Arthur*, his music to Howard's and Dryden's *Indian Queen*, to Urfey's *Don Quixote*, &c. A great many of his cantatas, odes, glees, catches, and rounds are yet familiar to lovers of vocal music. In 1683, he composed twelve sonatas for two violins and a bass. P. studied the Italian masters deeply, and often made reference to his obligations to them. In originality and vigour, as well as harmony and variety of expression, he far surpassed both his predecessors and his contemporaries. His church music has been collected and edited from the original MS. by Mr Vincent Novello, in a folio work which appeared in 1826—1836, with a portrait and essay on his life and works. He died of consumption in 1695, and was buried in Westminster Abbey.

PURCHASE-SYSTEM, a highly unpopular and much misunderstood arrangement in the British army, by which a large proportion—probably a half—of the first appointments of officers and their subsequent promotion is effected. It dates from the first formation of an English standing army, and was formally recognised in the reign of Queen Anne. The system itself is very simple. A price is fixed by regulation for each substantive rank (see Promotion), viz.—

	Price.	Difference.
Lieutenant-colonel, . . .	£4500	£1300
Major, ...	3200	1200
Captain, ...	1800	1100
Lieutenant, ...	700	250
Cornet or Ensign, . . .	450	

When any officer holding one of these regimental commissions desires to retire from the army, he is entitled to sell his commission for the price stipulated in the above table—£4500, in the case of a lieutenant-colonel. This sum is made up by the senior major, who is willing and able to purchase, buying the rank of lieutenant-colonel for £1300; the senior captain, willing and able to purchase, buying a majority for £1400; a lieutenant purchasing his company for £1100; a cornet or ensign becoming lieutenant on payment of £250; and lastly by the sale to some young gentleman of an ensigncy or cornetcy for £450. In practice, fancy prices higher than the above are often given, according to the popularity of a regiment, but this is only *sub rosâ*. The value of commissions in the Guards is also greater; but as they constitute but a few regiments, and are mostly officered from the nobility, they do not need particular description.

No commission can be purchased by one officer unless another officer vacates his commission by its sale. Death-vacancies, vacancies caused by augmenting a regiment, vacancies resulting from the promotion of colonels to be major-generals, are filled without purchase, usually by seniority. No rank above lieutenant-colonel can be purchased.

It is alleged with truth that purchase enables the rich man to step over the head of the poorer, but perhaps better qualified, non-purchasing officer; and that money decides where merit should be the only guide. These disadvantages, however, it is replied, are not unmixed. Purchase, it is argued, introduces into the army men of a very high class in society, who give a tone to the whole of military life. A great proportion of these wealthy men enter with the intention of merely spending a few years in the army, and then selling out. This tends, among other things, to keep the officers young—a great advantage; and, further, provides in the country, among its gentlemen, a body of men accustomed to military life, who prove themselves well adapted for commands in the militia and volunteers. Moreover, selection exercised arbitrarily, as it must be when the men from whom the selection is to be made are scattered all over the world away from the selecting power, would be certain to create dissatisfaction, and would probably be substantially unfair. If seniority were the rule, officers could scarcely change from one regiment to another; but under purchase, exchange is a common thing, and is the greatest boon to the poor officer who holds to his original corps, for the rich officers, for private reasons of locality, &c., are glad to change frequently from regiment to regiment, entering in each case at the *bottom* of the list of officers of their rank in their new regiment. This, of course, pushes the non-exchanging officer to the top, and the first death or other non-purchase promotion then falls to him. An officer who has not purchased at all, may nevertheless sell his commission for its full value if he has served twenty years, or for a sum less than the regulated price after shorter service. This is also a spur to promotion. On the whole, though exposed to the disadvantage and annoyance of being passed over by younger officers, the non-purchasing, i.e., the poor officers benefit by the purchase-system. This is proved by the slow progress officers make in corps where purchase does not exist, as, for instance, in the Royal Marines. Few would counsel the formation of a new army with such a system as purchase; but, on the other hand, it has its advantages in its working; and, now once established, would be most difficult to extinguish. The estimated cost of buying out existing rights of sale is calculated at from £3,000,000 to £5,000,000. Purchase does not exist in the artillery, engineers, marines, 19th to 21st regiments of cavalry, or 101st to 109th regiments of foot, and is in process of abolition in the military train.

PURCHASER. See SALE.

PURFLED, or PURFLEWED, in Heraldry, a term used with reference to the lining, bordering, or garnishing of robes, or ornamentation of armour.

PURGATION. See ORDEAL.

PURGATIVES are medicines which, within a definite and comparatively short time after exhibition, produce the evacuation of the bowels. The remedies included under this head have, however, various modifications of action, which adapt them for the fulfilment of different therapeutic applications. They are divided by Pereira into five groups, viz.:

1. *Laxatives.*—A purgative is said to be laxative when it operates so mildly as merely to evacuate the intestines without occasioning any general excitement of the system, or any extraordinary increase of watery secretion from the capillaries of the alimentary canal. This group includes manna, sulphur, cassia pulp, castor oil, &c.; and purgatives of this kind are employed when we wish to evacuate the bowels with the least possible irritation, as in children and pregnant women; in persons suffering from hernia, piles, stricture or prolapsus of the rectum, &c.

2. *Saline* or *Cooling Purgatives*, such as sulphate of magnesia, and potassio-tartrate of soda, either in simple solution, or in the form of Seidlitz Powder (q. v.). They give rise to more watery evacuations than the members of the preceding group, and are much employed in inflammatory and febrile cases.

3. *Milder Acrid Purgatives*, such as senna, rhubarb, and aloes. They possess acrid and stimulating properties, and are intermediate in activity between the last and the next group. Senna (generally in the form of Black Draught) is employed when we want an active but not very irritant purgative. Rhubarb is especially adapted for patients when there is a want of tone in the alimentary canal. Aloes is used in torpid conditions of the large intestine; but as this drug irritates the rectum, it should be avoided in cases of piles and of pregnancy, especially if there is any threatening of miscarriage.

4. *Drastic Purgatives*, such as jalap, scammony, gamboge, croton oil, colocynth, and elaterium, when swallowed in large doses, act as irritant poisons, and are employed in medicine when the bowels have resisted the action of milder purgatives, or when we wish to exert a powerful derivative action upon the intestinal mucous membrane (as in cases of apoplexy, when croton oil is commonly used), or when it is necessary to remove a large quantity of water from the system, as in dropsical affections, in which case, elaterium, from its hydragogue power, is usually employed.

5. *Mercurial Purgatives*, the chief of which are calomel, blue pill, and gray powder. They are commonly given with the view of increasing the discharge of bile, although their power in this respect has recently been denied. As their action is uncertain, they are usually combined with or followed by other purgatives. Podophyllin (q. v.) has recently been much used for the purpose of exciting bilious evacuations. Hamilton's book *On Purgative Medicines*, which was published more than half a century ago, is still the standard work on the subject of this article.

PURGATORY (Lat. *purgatorium*, from *purgo*, I cleanse) is the name given, in the Roman Catholic

and oriental churches, to a place of purgation, in which, according to their religious system, souls after death either are purified from venial sins (*peccata venialia*), or undergo the temporal punishment which, after the guilt of mortal sin (*peccata mortalia*) has been remitted, still remains to be endured by the sinner. The ultimate eternal happiness of their souls is supposed to be secured; but they are detained for a time in a state of purgation, in order to be fitted to appear in that Presence into which nothing imperfect can enter. As there is some obscurity and much misunderstanding on this subject, we shall briefly explain the doctrine of Catholics, as collected from authentic sources, distinguishing those things which are held by them as 'of faith,' from the opinions which are freely discussed in their schools. Catholics hold as articles of their faith (1) that there is a purgatory in the sense explained above, and (2) that the souls there detained derive relief from the prayers of the faithful and from the sacrifice of the mass. The Scriptural grounds alleged by them in support of this view are 2d Macc. xii. 43—46 (on which they rely, not merely on the supposition of its being inspired, but even as a simple historical testimony), Matt. xii. 32, 1st Cor. iii. 11—15, 1st Cor. xv. 29; as well as on certain less decisive indications contained in the language of some of the Psalms—as xxxvii. (in Auth. Vers. xxxviii.) 1, and lxv. 12. And in all these passages they argue not alone from the words themselves, but from the interpretation of them by the Fathers, as containing the doctrine of a purgatory. The direct testimonies cited by Catholic writers from the Fathers to the belief of their respective ages as to the existence of a purgatory, are very numerous. We may instance among the Greeks: Clement of Alexandria, *Stromata*, vii. 12; Origen, *Hom.* xvi. c. 5, 6 *in Jeremiam;* vi. *Hom. in Exod.;* xiv. *Hom. in Levit.;* xxviii. *Hom. in Numb.;* Eusebius, *De Vita Constantini*, iv. 71; Athanasius, *Quæst.* xxxiv. *ad Antioch.;* Cyril of Jerusalem, *Cat. Mystag.* v. 9; Basil, *Hom. in Psalm*, v. 7; Gregory of Nazianzen, xli. *Orat. de Laude Athanasii;* Gregory of Nyssa, *Orat. de Bapt.;* as also Epiphanius, Ephrem, Theodoret, and others. Among the Latins: Tertullian, Cyprian, Arnobius, Lactantius, Hilary, Ambrose, and above all, Augustine, from whom many most decisive passages are cited; Paulinus of Nola; and Gregory the Great, in whom the doctrine is found in all the fulness of its modern detail. The epitaphs of the catacombs, too, supply Catholic controversialists with some testimonies to the belief of a purgatory, and of the value of the intercessory prayers of the living in obtaining not merely repose, but relief from suffering, for the deceased; and the liturgies of the various rites are still more decisive and circumstantial. Beyond these two points, Catholic faith, as defined by the Council of Trent, does not go; and the council expressly prohibits the popular discussion of the 'more difficult and subtle questions, and everything that tends to curiosity, or superstition, or savours of filthy lucre.' Of the further questions as to the nature of purgatory, there is one of great historical importance, inasmuch as it constitutes one of the grounds of difference between the Greek and Latin churches. As to the existence of purgatory, both these churches are agreed; and they are further agreed that it is a place of suffering; but, while the Latins commonly hold that this suffering is 'by fire,' the Greeks do not determine the manner of the suffering, but are content to regard it as 'through tribulation.' The decree of union in the Council of Florence (1439) left this point free for discussion. Equally free are the questions as to the situation of purgatory; as to the duration of the purgatorial suffering; as to the probable number of its inmates; as to whether they have, while there detained, *a certainty* of their ultimate salvation; and whether a 'particular judgment' takes place on each individual case immediately after death.—See Bellarminus, *De Purgatorio;* Suaresius, *De Purgatorio;* and on the Greek portion of the subject, Leo Allatius, *De utriusque Ecclesiæ in Dogmate de Purgatorio perpetuâ Consensione.*

The medieval doctrine and practice regarding purgatory were among the leading grounds of the protest of the Waldenses and other sects of that age. The Reformers as a body rejected the doctrine.

What is called the 'historical' or critical view of its genesis, is well given by Neander (*Dogmengeschichte*, vol. i.). He conceives that its source is to be sought for in the ancient Persian doctrine of a purifying conflagration which was to precede the victory of Ormuz, and consume everything that was impure. From the Persians it passed with modifications to the Jews, and from them found its way into the ethical speculations of the more cultivated Christians. It harmonised admirably with the wide-spread philosophical notion borrowed by the Gnostic Christians from Neo-Platonism, that matter is inherently evil. If then the *body* was to rise, it must be purged of evil, and the instrument of purification—fire, was at hand for the purpose. Moreover, the high and pure conception of the character of God revealed in the New Testament, necessitating a corresponding moral excellence on the part of his worshippers—'without holiness shall no man see the Lord'—must have greatly assisted in the establishment of the doctrine, for how could men, only lately gross heathens, possessing yet but the rudiments of the new faith, and with most of their heathen habits still clinging about them, be pronounced 'holy' or 'fit for the presence of God?' Their 'faith' in Christ was sufficient to save them, but the work of sanctification was incomplete when they died, and must go on. Probably it was a strong Christian feeling of this sort that determined the reception of the doctrine of purgatory into the creed of the Catholic church, rather than any Gnostic philosophisings, though the Neo-Platonic divines of Alexandria are the first to mention it.

Protestants generally reply to the arguments of Roman Catholics on the subject of purgatory, by refusing to admit the authority of tradition or the testimonies of the Fathers, and at the same time by alleging that most—if not all—of the passages quoted from the Fathers, as in favour of purgatory, are insufficient to prove that they held any such doctrine as that now held by the Roman Catholic Church, some of them properly relating only to the subject of prayer for the dead, and others to the doctrine of Limbus (q. v.). That the doctrine of purgatory is the fair development of that which maintains that prayer ought to be made for the dead, Protestants generally acknowledge, but refuse to admit that the Fathers carried out their views to any such consequence. As to the alleged evidences from Scripture, they are commonly set aside by Protestants as merely ridiculous. The much vaunted argument from the second book of Maccabees, is of course contemned, as being from an apocryphal book, and not one of the best books of the Apocrypha; besides, that the passage relates to nothing more than prayer for the dead. The text Matt. xii. 32, is explained as relating to the final judgment; and 1 Cor. iii. 11—15, as relating to a trial of *works*, and not of persons; whilst 1 Cor. xv. 29 is regarded as having nothing more to do with the subject than any verse taken at random from any part of the Bible.

PURGING NUT. See Physic Nut.

PURIFICATION, in a Biblical sense, is the act through which an individual became fit to approach the Deity, or to mix freely in the community, in cases where a certain bodily or other disability had kept him out of the pale of the latter. The purification consisted chiefly in expiations, ablutions, sometimes accompanied by special sacrifices. Priests and Levites were consecrated for the Divine service by 'purification;' proselytes had to undergo it at baptism; and special religious acts could only be performed by those who had 'bathed their bodies.' Generally, no one was allowed to enter the Temple or synagogue without having washed or 'sanctified' himself; and in the post-exilian period, bathing was considered (chiefly by the Pharisees and Essenes) as one of the chief duties of piety. In general, the Mosaic Law distinguishes between 'clean' and 'unclean' persons as well as things, calling 'unclean' all that with which an Israelite is not to come in contact. It has been erroneously assumed that all the Levitical laws of purity and purification have a physical or medical reason – that is, that infection was to be prevented through them; but this can only have been the case in some instances. At the same time, we cannot deny that we are at a loss for the general principle on which they were based. There can be no doubt that cleanness, like every other virtue, if not enforced on religious grounds, would have had few devotees in those days, and among an eastern people; while, again, a hot climate requires a much greater attention to outward purity than more temperate zones. Compared with the Indian and Persian laws in this respect, the Jewish ones seem much less minute and harassing. For the purification from the several kinds of uncleanness, a certain 'water of uncleanness' (Lev. xv.) was prepared; and the different acts to be performed for the readmission of the leper into the community (Lev. xiv. 4–32), shew plainly that his was considered the last stage of impurity. Identical with the first stage of the leper's purification are the ceremonies to be performed in the case of infected houses and garments. The sixth Seder of the Mishnah, in 11 treatises (there is no Gemara to this portion, except to Niddah), contains the most detailed regulations (as fixed by tradition) on this point. The washing of hands, we may add in conclusion, was in later times considered ritually necessary, in accordance with the Talmudical maxim, that 'every table should properly be sanctified into an altar.' See UNCLEANNESS.

All the Jewish ceremonial purifications are commonly regarded by Christian theologians as emblematic of the necessity of holiness in the people of the Lord, and particularly in all acts of worship.

PURIFICATION OF THE BLESSED VIRGIN MARY, FEAST OF, a festival in commemoration of the 'purification' of the Blessed Virgin Mary, in accordance with the ceremonial law of Lev. xii. 2. This ceremony was appointed for the fortieth day after childbirth, which, reckoning from December 25 (the Nativity of our Lord), falls upon February 2, on which day the purification is celebrated. The history of Mary's compliance with the law is related in Luke ii. 22—24; and as on the same occasion she complied also with the law of Numb. xviii. 15, by the offering prescribed in redemption of the first-born, the festival is also called by the name of the 'Presentation of the Child Jesus,' or the 'Feast of Simeon,' and sometimes, also, 'of the Meeting' (*occursus*), in allusion to Simeon's meeting the Virgin mother, and taking the child into his arms (Luke ii. 25). The date of the introduction of this festival is uncertain. The first clear trace of it is about the middle of the 5th c., during the reign of Marcia, and in the church of Jerusalem. Its introduction in the Roman Church in 494 was made, by Pope Gelasius, the occasion of transferring to a Christian use the festivities which at that season were annexed to the pagan festival of the Lupercalia.

PURITANS, a name first given, according to Fuller, in 1564, and according to Strype, in 1567, to those clergymen of the Church of England who refused to conform to its liturgy, ceremonies, and discipline as arranged by Archbishop Parker and his Episcopal coadjutors. But in point of fact, the Puritan tendency in the Church of England is as old as the church itself; and to seek for its true origin we must go back to the period of Cranmer, who, when laying the foundations of English Protestantism in a nation only half-prepared for the change, found it necessary to make concessions to the older religion, and to build the new church on an elaborate system of compromise. This feature of 'Anglicanism'—its essential *broad-churchism*—gave great offence to the stricter and more doctrinal of the English reformers, who neither cared nor were competent to look at the thing from a statesman's point of view. The reign of Edward VI., brief though it was, shewed quite clearly that if the party in the English Church who had acquired not only their theology, but their opinions of church-government from Calvin, ever got the upper hand, they would not stop till they had reconstructed, on a much simpler basis, the whole ecclesiastical fabric. The reaction under Mary drove most of them to seek safety in exile on the continent. It was here the first definite step in the history of Puritanism was taken. A number of the exiles resident at Frankfurt determined to adopt the Genevan service-book in preference to that appointed by King Edward, and though their attempt proved a failure, partly on account of the opposition of others of the exiles, yet it shewed the pertinacity with which they tried to carry their convictions into practice. On their return to England, after the accession of Elizabeth, the struggle was renewed. But the virile queen would not tolerate their notions, and during her whole reign, punished in the most stringent style all who refused to obey the Episcopal ordinances. The position assumed by the P. was that the liturgy, ceremonies, and discipline of the Church of England required further reformation; that the church, as then constituted, did not separate itself markedly enough from Roman Catholicism; and that it was desirable, in the interests of religion, to abandon everything that could boast of no other authority than tradition or the will of man, and to follow as far as possible the 'pure' word of God. Hence their name, which was probably given in derision. In spite of the sharpest repressive measures, their principles gradually spread among the serious portion of the laity, who were also called Puritans. But the name appears not to have been confined to those who wished for certain radical changes in the forms of the church. The character that generally accompanied this wish led naturally enough to a wider use of the term; hence, according to Sylvester, 'the vicious multitude of the ungodly called all Puritans that were strict and serious in a holy life, were they ever so conformable.' This is the sense in which the Elizabethan dramatists use the word. From this very breadth of usage, one sees that there were different degrees of Puritanism. Some would have been content with a moderate reform in the rites, discipline, and liturgy of the church; others (like Cartwright of Cambridge) wished to abolish Episcopacy altogether, and to substitute Presbyterianism; while a third party, the Brownists or Independents (q. v.),

were out-and-out dissenters, opposed alike to Presbyterianism and Episcopacy. During the reigns of James I. and Charles I., the spirit of Puritanism continued more and more to leaven English society and the English parliament, although the most violent efforts were made by both monarchs to extirpate it. The tyrannical proceedings of Laud and of the Laudian bishops, and the outrages practised by Charles on the English constitution, led many who were not at all Genevan in their ideas to oppose both church and king for the sake of the national liberties. Hume distinguishes three kinds of P.: 1. The *Political P.*, who disliked the bishops, not so much on ecclesiastical grounds, as on account of their servility towards the king, and their priestly antipathy to civil liberty; 2. The *P. in Church Discipline*, who were for the most part in favour of Presbyterianism; 3. The *Doctrinal P.*, who were strong Calvinists on such points as predestination, free-will, grace, &c., but were not opposed to Episcopacy or to the ecclesiastical authority of the monarch, and who contented themselves with assailing the Arminianism that was encouraged at court. The attitude of this third class was certainly anomalous, and it is not wonderful that they exercised so little influence or control on the march of events in the great civil struggle. The second class was by far the most numerous—at least among the clergy; and at first it seemed as if the clergy were going to have things all their own way. For example, in the memorable 'Westminster Assembly of Divines' (1643), the great majority of the ministers were Presbyterians, and their *Confession of Faith* is quite a Presbyterian affair. But genius, energy—the arms of victory—belonged to the more advanced P., who were predominant in the army and the parliament, and ultimately triumphed in the person of Cromwell (q. v.). But the Restoration (1660) brought back Episcopacy, and the Act of Uniformity (1662) threw the P. of the church into the position of dissenters. Their subsequent history is treated under the different forms of dissent. Before the civil war broke out, so great were the hardships to which the P. were exposed, that many of them emigrated to America, to seek liberty and peace on the solitary shores of the New World. There they became the founders of the New England States, and cultivated unmolested that form of Christianity to which they were attached. Nowhere did the spirit of Puritanism in its evil as well as its good more thoroughly express itself than in Massachusetts and Rhode Island; nor have its traces wholly disappeared even yet. In Scotland, Puritanism, in the shape of Presbyterianism, was from the first the established religion; hence it does not present itself to us in that country as a struggling, suffering, antagonistic, and protesting force; nor, in point of fact, was the name of P. ever given even to the extremest sect of Covenanters.—See Neale's *History of the Puritans*; Price's *History of Protestant Nonconformity in England*; and Macaulay's *History of England*.

PURL, a beverage now little used except among the lower classes in and around London. It is made by warming a pint of ale with a quarter of a pint of milk, and adding some sugar and a wine-glassful of gin, rum, or brandy.

PU'RLINS, pieces of timber used in framed roofs, between the principals, for the support of the common rafters.

PU'RMEREND, a flourishing little town in North Holland, 10 miles north of Amsterdam, and on the line of the great canal from that city to the North Sea. Pop. nearly 5000. It has a large trade in cheese, butter, eggs, cattle, and wood, upwards of 1,500,000 lbs. of cheese being annually sold in the market. In 1862, the number of ships which entered amounted to 138, having an aggregate burden of 36,235 tons, 7 belonging to the Netherlands, and 131 to foreign ports, 127 being timber-laden. The town, which sprung up under the protection of the castle of Purmerstein (built at the beginning of the 15th c.), derives its name from being situated at the end of the Purmer, formerly a sheet of water, by drainage made a fertile tract of land containing 6701 acres.

PU'RNEAH, a large town of British India, capital of an extensive and populous district of the same name in the presidency of Bengal, on the north bank of the Ganges, stands on both banks of the Little Kosi river, 230 miles north-north-west of Calcutta. It covers a considerable area, but it is not compactly built, there being numerous plantations, gardens, and other open places within the boundaries. Around the town are numerous straggling villages. A considerable quantity of indigo is grown in the vicinity. The civic establishment consists for the most part of Europeans. Pop. from 40,000 to 50,000.

PURPLE OF CASSIUS, or GOLD PURPLE, a beautiful colouring material of a vitreous character, which was made known in Germany in the 17th c. by an artist named Andrew Cassius, whose father was secretary to the Duke of Schleswig. Its property is to give a beautiful ruby red to glass, and it was therefore, and still is, employed to make imitation rubies. It is made by combining one part of neutral chloride of gold with a mixture of one part of protochloride and two parts of perchloride of tin, all in solution. When mixed together, a beautiful purple precipitate is the result, which is the Purple of Cassius. The French recipe, which is said to be the best, is 10 parts of acid chloride of gold dissolved in 2000 parts of distilled water. To this add a solution, carefully prepared, in another vessel, of 10 parts of pure tin in 20 parts of muriatic acid diluted with 1000 parts of water. On mixing the two, the purple precipitate is thrown down, and is separated by filtering and decantation.

PURPLE COLOURS. Painters in oil and water colours produce the various shades of purple by the admixture of pure red and pure blue colours. Dyers obtain this colour from various sources, all of which are curious and interesting. From a very early period, purple has been one of the most highly prized of all colours, and came to be the symbol of imperial power. Probably one great reason for this was the enormous cost of the only purple colour known to the ancients, the Tyrian purple, which was obtained in minute quantities only from a Mediterranean species of molluscous animal or shell-fish, the *Murex trunculus*, and perhaps also *Purpura lapillus*. In the time of Cicero, wool double-dyed with this colour was called *dibapha*, and was so excessively dear, that a single pound-weight cost a thousand denarii, or about £35 sterling. A single murex only yields a small drop of the secretion, consequently very large numbers had to be taken in order to obtain enough to dye even a small amount of wool. Tarentum, the modern Otranto, was one of the great murex fisheries of the Romans, and there they had a number of large dyeing establishments. Vast heaps of the shells have been discovered there, the remains of its former industry. With the decline of the Roman empire, the employment of this purple colour ceased, and it was not until a Florentine of the name of Orchillini discovered the dyeing properties of the lichen now called Orchella Weed, that a simple purple colour was known in Europe.

The discovery was kept secret in Italy for nearly a century, and that country supplied the rest of Europe with the prepared dye, which received the name of Orchil or Archil (q. v.). The colour was very fugitive, and soon ceased to be used by itself; it, however, was found very useful in combination, and has a remarkable power of brightening up other colours. Many improvements have been lately made in archil dyeing, especially in fixing it. Its value, however, has been greatly lessened by the discovery of the beautiful series of purples yielded by coal-tar as results of the combination of one of its products called aniline with other bodies. See DYEING.

PURPLE EMPEROR (*Apatura Iris* or *Nymphalis Iris*), one of the largest of British butterflies, and one of the most richly coloured. The expanse of wings is from 2½ to 3¼ inches. The wings are strong and thick, and the flight more sustained

Purple Emperor (larva and pupa shewn below).

than that of many butterflies. The P. E. is very often to be seen about the tops of oak-trees.

PURPLE WOOD, or PURPLE HEART, the heart-wood of *Copaifera pubiflora* and *C. bracteata*, a very handsome wood of a rich plum colour. The trees producing it are natives of British Guiana, where the wood is called generally *Marimayama*. The trees are rather rare on the coast, but in the upland forests are common. The chief interest of the wood is its remarkable adaptation to the purposes of artillery and fire-arms. It is said no wood is better adapted for mortar-beds and gun-carriages, as it sustains better than any other the violent concussions to which they are subjected. Its chief use in this country has been for making ramrods for muskets. Its great beauty and smooth grain would insure its extensive employment in cabinet-work in this country, if it were better known.

PURPLES. See EAR-COCKLES.

PURPURA, a genus of gasteropodous molluscs, of the family *Buccinidæ*. The species are very similar to those of the genus *Buccinum* (see WHELK), but have a less elongated shell, and a flattened columella, which is pointed at the base, and forms there, with the outer lip, a canal excavated as a notch in the shell, and not projecting. The species are numerous, mostly natives of the shores of warm climates. *P. lapillus* is a species pretty common on most parts of the British coast. It is smooth and whitish, with bands of reddish-brown, and sometimes two inches long. It feeds on mussels and other molluscs,

Purpura:
Shell of *P. patula*; an animal of *P. haemastoma*

these which yielded the famous Tyrian purple of the ancients. *P. patula* is supposed to have been one of those from which this dye was obtained, but it may have been obtained from others, as *P. lapillus*. The dye is contained in a small vesicle like sac near the head. See PURPLE COLOUR.

PURPURA, or THE PURPLES, is a malady which is often erroneously placed amongst the diseases of the skin. It is in reality a blood disease, and is characterised by the appearance of small round spots, of a deep purple colour, which are seen first and most abundantly on the legs, and afterwards extend to the arms and trunk. They are accompanied by no local pain, are not effaced by pressure (being due to a drop of blood extravasated beneath the cuticle, or in the structure of the skin itself), do not rise above the surrounding surface, and are sometimes intermixed with livid patches resembling bruises; and, before disappearing, both the round spots and the patches undergo the same change of colour which a bruise undergoes. These spots are not peculiar to the skin, but occasionally occur upon internal surfaces, and in the tissues of viscera. Passive hæmorrhages from the mucous membranes frequently accompany the external symptoms. There is usually much debility, and often a great tendency to faintness. The duration of the disease varies from a few days to a year or more. Slight cases are devoid of danger, and even the hæmorrhagic cases usually recover, unless the bleeding has been excessive, or the blood has been extravasated into a vital organ.

The causes of this disease are obscure. The mode of treatment varies in different cases, but the main indication always is to correct the condition of the blood. When there is reason to believe that the disease is dependent upon depressing influences, a nutritious diet, tonics, and stimulants are required; and chalybeates, or the mineral acids, and quinine, with plenty of exercise in the open air, should be prescribed. When, however, there is no evidence of the operation of any debilitating cause, and the pulse is hard, the most efficient treatment consists in abstinence, venesection, and purgatives. In cases of a mixed nature, a mixture of the oil of turpentine and castor-oil, in free doses (2 drachms of the former to 5 or 6 drachms of the latter), and iced drinks, or the sucking of small pieces of ice, have been strongly recommended. If the hæmorrhage is not stopped by the oil of turpentine, gallic acid, or acetate of lead and opium, must be prescribed; and if it proceeds from accessible parts, local measures, such as the employment of ice or strong astringents, should also be employed.

PURPURE, in Heraldry, the colour purple, expressed in engravings by lines in bend sinister. It is of unfrequent occurrence in British heraldry.

Purpure.

PURPURINE. See MADDER.

PURRE. See DUNLIN.

PURSE-CRAB (*Birgus*), a genus of *Crustacea*, of the order *Decapoda*, and suborder *Anomoura* (see CRAB), allied to Hermit-crabs (q. v.), but having the abdomen or *tail* shorter and almost orbicular, its under surface soft and membranous, its upper surface covered with strong plates, which overlap one another as in lobsters. The first pair of legs have large and powerful pincers; the pair of legs nearest the abdomen are very small, but terminated by rudimentary pincers; the pair next to them larger, with small pincers; the second and third pair of legs are terminated by a single nail. A species of P. (*B. latro*) is found in Mauritius and in the more eastern islands of the Indian Ocean. It is one of the largest of crustaceans, sometimes two or three feet in length when fully stretched out, and

Purse-crab (*Birgus latro*).

capable of erecting itself to the height of a foot from the ground, which it readily does if irritated, retreating backward, and exhibiting to the utmost its powers of offence or defence. It is of a yellowish-brown colour, its limbs covered with little blackish projections. It is never found far from the sea, to which it is said to pay visits, in order to moisten its gills; but it resides on land, and often in holes under the roots of trees, where it accumulates great quantities of the fibres of the cocoa-nut husk, as if to keep itself warm, or for a soft bed. The Malays rob these stores to supply themselves with junk. The gills of the P. are contained in a very large cavity, of which they fill only a very small part. Its food consists of cocoa-nuts and other nuts, which it climbs trees to procure. Its manner of dealing with a cocoa-nut is described as exhibiting a remarkable instinct, as it always begins to tear off the husk at the end where the *eyes* are. It is variously stated that it makes a hole through the eye from which the nut would germinate, and then scoops out the nut with the small pincers of its fourth pair of legs; and that having made this hole, it seizes the nut by one of its great pincers, and breaks it against a stone. Both statements may perhaps be true.

PURSER, in the Royal Navy, was formerly a warrant, and subsequently a commissioned officer, in charge of the provision, clothing, pay, and necessaries of a ship-of-war. His title was changed in 1844 to that of Paymaster (q. v.).

PURSLANE (*Portulaca*), a genus of plants of the natural order *Portulaceæ*, having a bifid calyx, 4 or six petals, 8 or 16 stamens and a capsule dividing around the middle. COMMON P. (*P. oleracea*) grows in cultivated and waste grounds on the sea-shore, in almost all tropical and subtropical parts of the world. It is cultivated as a pot-herb. It is a short-lived annual, with spreading and rather procumbent stems, and obovate fleshy leaves, which, as well as the young shoots, are frequently used in salads. The young and tender shoots are pickled in France like gherkins. P. is not so common in British gardens as it once was.

PURSUIVANT (Fr. *poursuivant*, follower), the third and lowest order of heraldic officers. The office was instituted as a novitiate, or state of probation through which the offices of herald and king-at-arms were ordinarily to be attained, though it has been held that a herald or king-at-arms may be made *per saltum*. There are four pursuivants belonging to the English College of Arms: *Rouge Croix*, the oldest, so named from the Cross of St George; *Blue-mantle*, instituted either by Edward III. or Henry V., and named in allusion to the robes of the Order of the Garter, or perhaps to the colour of the arms of France; *Rouge Dragon*, deriving his title from King Henry VII.'s dexter supporter, a red dragon, assumed in allusion to his descent from Cadwaladyr; and *Portcullis*, named from a badge of the same monarch. There are six pursuivants in the heraldic establishment of Scotland, known by the names of *Dingwall*, *Bute*, *Carrick*, *Ormond*, *Kintyre*, and *Unicorn*—titles which, as well as those of the heralds, seem to have originated in the reign of James III. The Scottish pursuivants take precedence according to seniority in office.

In ancient times, any great nobleman might institute his own pursuivant with his own hands and by his single authority. The Dukes of Norfolk had a pursuivant, called *Blanch-lyon*, from the white lion in their arms; the pursuivant of the Dukes of Northumberland was styled *Espérance*, from the Percy motto; and Richard Nevil, Earl of Salisbury, had a pursuivant called *Egle vert*. We even find Sir John Lisle, in 1442, making Thomas de Launey his pursuivant, by the title of *Blanch Sanglier*. The ancient costume of a pursuivant of the king was a surcoat, embroidered with the royal arms, and worn with one sleeve hanging down in front, and another behind. In 1576, Rouge Croix was severely censured for wearing his coat as a herald. In later times, however, a pursuivant's coat is worn exactly as a herald's, the latter officer being distinguished by the collar of SS.

PURÛRAVAS, a celebrated legendary king of ancient India. According to tradition, he was a son of the planet Budha, or Mercur, by Ilâ—a name of the earth, a prince renowned for liberality, devotion, magnificence, truthfulness, and personal beauty; but still more so on account of his love for the Apsaras Urvas'i. This heavenly nymph having incurred the imprecation of some gods, and therefore having been compelled to descend from heaven, saw P., and was seen by him. The king having, in consequence, fallen in love with Urvas'i, she consented to return his affection, on the condition that he would never suffer two rams, which she loved as children, and always kept near her bedside, to be carried away from her, and also that he should never be seen by her undressed. To these terms the king gave his assent; but the Gandharvas, the choristers in Indra's heaven, and the husbands of the Apsarasas, being jealous of P., instigated one of their tribe to carry away one of the rams during the night; and after he had accomplished their design, other Gandharvas came and stole the second ram. Upon this P., highly incensed, and trusting that the nymph would not see his person, as it was

dark, rose in pursuit of the robbers. At that moment, however, the Gandharvas caused a flash of lightning to irradiate the scene, and Urvas'i beheld the king undressed. The compact was violated, and Urvas'i disappeared, while the Gandharvas, abandoning the rams, departed to the sky. P. recovered the animals, but could find Urvas'i nowhere. Like one insane, the king now wandered over the world, until he saw her, at Kurukshetra, sporting with four other nymphs of heaven in a lake beautified with lotuses. Urvas'i, however, told him to keep away from her until, at the end of the year, she should be delivered of the son with whom she was pregnant by him. He obeyed; and after Ayus was born, these annual interviews between P. and Urvas'i were repeated, until she had born him five other sons—Dhîmat, Amâvasu, Vis'vâyus, Satâyus, and S'rutâyus. But the king, now longing for an uninterrupted re-union with his wife, Urvas'i endeavoured to propitiate the Gandharvas who had caused their separation. Her efforts were successful; and they taught the king how to produce by attrition, from the wood of the fig-tree, a sacrificial fire, and how to divide it into the three fires required for sacrificial acts. By this means, they enabled him then to celebrate many sacrifices, and, by virtue of these, to be transferred to the sphere where Gandharvas and Apsarasas dwell together. This legend is adverted to in the Vedas, and related with more or less detail in the *Mahâbhârata* and the *Purâṇas* (see, for instance, Wilson's *Vishṇu-Purâṇa*); it is likewise the subject of the celebrated drama of Kâlidâsa, the *Vikramorras'i*, where, however, the incidents that, according to the *Purâṇas*, cause the separation of P. and Urvas'i, are not mentioned by the poet, her disappearance being ascribed by him to a fit of jealousy, in which she trespassed on the proscribed bounds of a divine hermitage. It deserves notice, too, that, in the drama, Urvas'i is transformed into a creeper, and discovered in that condition by P., when frantically roaming in search of her in the forest of Akalusha—a transformation pointing to some affinity between this latter myth and that of Daphne when pursued by Apollo.—The idea, however, on which the original Hindu myth is based—apart from the semi-historical and fantastical detail by which it was overgrown—seems to have been suggested by the (supposed) motion or wanderings (Purûravas, from *puru*, much, and *ravas*, going—from *ru*, go, move) of the sun (*Gandharva*, in the Vedas, also being a personification of the fire of the sun), attracting or absorbing, and thus uniting, as it were, with the vapours floating in the sky (*Apsaras*—from *ap*, water, and *saras*, going, arising, hence 'water-born'—being originally 'personifications of the vapours which are attracted by the sun, and form into mists or clouds;' see Goldstücker's *Sanskrit Dictionary*, under 'Apsaras;' and Urvas'i, from *uru*, large, wide, and *as'*, pervade, hence 'the far-pervading'—being identified in one passage of the *Mahâbhârata* with the river Ganges). A Greek myth of a kindred character is that of Apollo and Daphne, and also that of *Io*, according to the ingenious interpretation of it by Professor P. W. Forchhammer, in the *Verhandlungen der Versammlung deutscher Philologen in Frankfort*, 1862. In his *Hellenica*, the same scholar has moreover shewn that, in Greek mythology, the ram is a symbol of the cloud.

PURVEY'ORS, Army, are officers charged with superintending the civil affairs of army hospitals, as the payment of men, procuring provisions, medical comforts, bedding, &c. The purveyor acts independently of the medical officer, and is responsible

through the purveyor-in-chief to the Secretary of State for War. The establishment consists of [illegible] principal purveyors, 20 purveyors, 20 deputy-purveyors, and 20 purveyors' clerks. A purveyor-in-chief has £[illegible] a year, rising to £[illegible] after long service. He ranks with a colonel in the army. All under officers have fixed commissions. The head, assisted by the principals at the principal depôts, is [illegible]

PUS is a well-known product of [illegible] and occurs as a thick yellow creamy fluid, differing from all other morbid exudations in containing a large number of corpuscles, having a salt and fatty taste when chewed, between the fingers it produces cream, usually an alkaline reaction, and a specific gravity of about 1·032. Like the blood, it consists of certain definite anatomical elements, each of an intercellular fluid or serum in which they occur.

The microscopic elements are: 1. The pus-globules, which, both in their morphological and chemical relations, seem to be identical with the lymph-corpuscles, or colourless blood-cells; in diameter, they range from 0·0004 to 0·003 of a line, and each consists of a cell-wall, which often appears granular, of small transparent particles, and of a nucleus which is adherent to the cell-wall, and which can be rendered much more apparent by the addition of acetic acid. 2. Molecular granules, and 3. Fat-globules. The serum of pus is perfectly clear, of a slightly yellow colour, and coagulates on heating into a thick white mass.

The chemical constituents of P. are water (ranging from 760 to 907 in 1000 parts), albumen (from 44 to 180); fats (from 9 to 25), extractive matter (from 19 to 29); and inorganic salts (from 6 to 13), in addition to which, urea, [illegible] are occasionally present. Of the inorganic or mineral constituents, the soluble salts are to the insoluble in the ratio of 8 to 1, and the chloride of sodium (the chief of the soluble salts) is three times as abundant as in the serum of the blood. The mode of formation of pus is considered in the article SUPPURATION.

PUSEY, Rev. Edward Bouverie, D.D., Regius Professor of Hebrew at Oxford, and Canon of Christ-church, a celebrated English divine, and one of the chief promoters of the High Church movement in the Church of England. He is the second son of the Honourable Philip Bouverie (younger brother of the first Earl of Radnor, who assumed the name of P.), by Lady Lucy Pleasant, eldest daughter of Robert, fourth Earl of Harborough. He was born in the year 1800, was educated at Eton, and thence proceeded to Christ-church, where he obtained a first class in Classics in 1822, and gained the university prize for a Latin essay in 1824. He was afterwards elected Fellow of Oriel; and in 1828 succeeded Dr Nicoll in the Regius Professorship of Hebrew, to which a canonry at Christ church is annexed.

Dr P.'s first publication was on the *State of Religion in Germany*, the result of a visit to that country, which appears to have greatly influenced his subsequent course, and led him to devote himself to resist the progress of Rationalism. In 1828 he became a contributor to the *Tracts for the Times* (in union with Messrs J. H. Newman, Keble, Williams, &c.), of which Nos. 67, 68, *On Holy Baptism*, and Nos. 18 and 65, *On the Benefit of Fasting*, were written by him (see TRACTARIANISM). He was also one of the editors of the *Library of the Fathers*, and of the *Library of Anglo-Catholic Theology*. In consequence of a sermon on *The Holy Eucharist, a Comfort to the Penitent*, preached before the university in 1843, he was

suspended from preaching by the Vice-chancellor for three years, on the allegation that his language on the subject of the Real Presence was beyond what is sanctioned by the Formularies of the Church of England. Dr P., however, protested against the proceeding, and appealed to the teaching of English divines. His other principal works are—*Remarks on the Benefits of Cathedral Institutions;* two treatises on the *Royal Supremacy in Spiritual Matters;* a treatise on the *Ancient Doctrine of the Real Presence; Letters to the Archbishop of Canterbury, the* (late) *Bishop of Oxford, and the* (late) *Bishop of London, in Defence of Church Principles; On Marriage with a Deceased Wife's Sister; On the Use of Private Confession in the English Church;* Translations of several foreign devotional works adapted to the use of the English Church; a *Commentary on the Minor Prophets*, now in progress; *Lectures on the Prophet Daniel;* a *Catalogue of Arabic MSS. in the Bodleian Library;* and numerous sermons.

PUSHKIN, Alexander Sergeivitch, a Russian poet of good family, was born at Moscow, 26th May 1799, and educated at the imperial lyceum of Tsarskoe Selo, where he acquired more reputation for his liberal opinions than for his attention to study. In 1817, he entered the service of government, and soon became one of the most prominent figures in fashionable society. In 1820, he published his romantic poem of *Ruslan and Liudmila*, which met with a flattering reception from the public. The incidents are laid in the legendary times of Vladimir, the Russian Charlemagne. During the next five years, P. led a roving sort of life, in the course of which appeared his *Plennik Kavkaskoi* (Prisoner of the Caucasus, 1822), which narrates the escape of a young Russian from a Circassian horde by the help of a Circassian maid; and his *Fountain of Bakhtchserai* (1824), a poem of singular beauty and interest. These were followed by *Tzigani* (The Gipsies, 1827), a picture of wild gipsy life in Bessarabia, and *Evgenii Onaegin* (1828), a humorously sarcastic description of Russian society—after the fashion of Byron's *Beppo*. In 1829, he published his last narrative poem, *Poltava*, which has for its hero Mazeppa, the famous Hetman of the Cossacks. About the same time, he wrote a dramatic poem entitled *Boris Godunov*, one of the best of all his works; but subsequent to this he appears to have addicted himself almost wholly to prose. Another, and less commendable change, however, took place in him. From being or seeming an enthusiastic 'liberal,' he passed—after his appointment to the office of imperial historiographer, with a pension of 6000 rubles—to the extreme of Russian conservatism. The chief thing he did in his official capacity was to write the life of the rebel Pugatschew. He was mortally wounded in a duel, and expired at St Petersburg, January 29 (February 10), 1837. P. is reckoned the finest poet that Russia has produced in the present century. His countrymen call him the 'Russian Byron,' and he has not a little of the bold and brilliant genius of his prototype, excelling like him in vigour of imagery and impassioned sentiment.

PU'STULAR DISEASES. Under this head are included the cutaneous diseases which are characterised by *pustules*, or circumscribed elevations of the cuticle, containing pus; they are Ecthyma, Impetigo, Acne, and Sycosis, all of which are noticed in special articles. Pustules also occur in small-pox, and occasionally in chicken-pox, but these are on good grounds regarded as febrile diseases, in which the eruption on the skin is not the primary disorder. Boils (q. v.), although not included under the head of 'pustular diseases,' are in their nature pustular.

PU'TCHUK, an aromatic root, a considerable article of commerce in India, where it is used both as a perfume and as a medicine, and of export to China, where it is much used for incense, as it gives out a very pleasant odour when burned. It appears to be the *Costus* (q. v.) of the ancients, and is the root of *Aucklandia costus*, one of the *Compositæ*, and not, as was once supposed, of a species of *Costus*, one of the *Scitamineæ*. It grows in Cashmere, and is called *Kooth* in Northern India. P. is its name at Calcutta.

PU'TLOGS, small timbers used in the construction of buildings. They lie between the wall and the poles of the scaffolding, and on them the floor of the scaffolding rests. Apertures called 'putlog-holes' are common in buildings of all ages.

PUTREFA'CTION is the term applied to the spontaneous decomposition of organic substances, when such decomposition is accompanied by an offensive odour. In other respects, it may be regarded as identical with Fermentation (q. v.). In the process of putrefaction, organic compounds of a higher order are resolved into lower organic compounds, into inorganic compounds (such as water, ammonia, sulphuretted hydrogen, &c.), or into simple chemical elements (such as hydrogen or nitrogen. The substances which most readily putrefy are the protein bodies (albumen, fibrine, caseine, &c.) and gelatigenous tissues, glue, &c.; the only necessary conditions being the presence of moisture and the access of air at the commencement of the process. Since animals are mainly composed of the protein bodies, they are especially liable to undergo this change; but many vegetable products, which are rich in these bodies (e. g., seeds), are also prone to this form of decomposition. The peculiar smell is readily accounted for when the nature of the resulting compounds is considered.

The putrefaction of organic matters is prevented by a variety of conditions, amongst which may be mentioned (1) exclusion of air, (2) perfect dryness, (3) a freezing temperature (as, e. g., in the case of the mammoths preserved in the Siberian ice), (4) a high temperature (about 250°), and (5) antiputrescent or antiseptic substances of various kinds. It is worthy of notice that all bodies susceptible of putrefactive decomposition may act as ferments, and may thus induce special changes in sugar, urea, &c., which would not have occurred except in the presence of the putrefying matter.

PUTRID FEVER. See Jail Fever.

PUTTING TO SILENCE, in the Law of Scotland, is the title of a suit or action of declarator, the object of which is to put an end to certain pretended claims of marriage. The most recent illustration of this action was that in Yelverton *v.* Yelverton. The suit corresponds to what is called in England a suit of Jactitation (q. v.).

PUTTY, a composition of *whiting* and *drying* oil worked into a thick paste. It is used by painters and glaziers—by the former for filling up holes in surfaces, previous to their being painted with oil-colours; and by the latter, for fixing panes of glass in windows, &c. It becomes remarkably hard in time, and fixes the glass immovably. This has been found rather an evil in some cases, especially where thick plate-glass is used for skylights and other roofing purposes, because it will not permit the expansion and contraction caused by the varying temperature to which the glass is exposed in such situations. Hence the addition, in such cases, has been made lately of a pound of fine Russian

tallow to every twelve pounds of the ordinary putty materials. This prevents its becoming extremely hard, and insures a certain amount of elasticity.

PUTTY-POWDER, a material, consisting of peroxide of tin, in great use for polishing stone and metal work. It is also used as a colouring material for white glass, and for the white enamels of porcelain, &c. It is made by melting tin; as the surface oxidises, the scum, which is the protoxide, is raked off, and when cold, is reduced to a fine powder, which is white in colour, and the particles are extremely hard.

PUY is the name commonly given in the highlands of Auvergne and the Cevennes to the truncated conical peaks of extinct volcanoes. It is perhaps connected with *puit* or *puits*, 'a well' or 'vent,' and may have been given in allusion to the craters of these mountains.

PUY, Le, or LE PUY-EN-VELAY, a town of France, department of Haute-Loire, about 70 miles south-west of Lyon, is one of the most picturesque towns in Europe. It stands on the steep southern slopes of Mount Anis, from the summit of which starts up precipitously the huge basaltic mass called *Rocher de Corneille*, crowned by the ruins of an ancient episcopal castle. The greatest natural curiosity is the *Rocher de St Michel*, an obelisk of nature's own making, composed of basaltic tufa, and rising in a solitary abrupt cone from the margin of the river Borne to a height of 265 feet, with a circumference at its base of 500 feet, and at its top, of from 45 to 50 feet. The sides of this 'sugar-loaf' are almost perpendicular; but a winding stair cut along the rock conducts to the summit, which is surmounted by a little Romanesque chapel of the 10th century. The most notable buildings of Le P. are the cathedral, a splendid but heavy-looking structure of the 10th or 11th c., situated in the highest part of the town, and chiefly remarkable for a wonder-working image of the Virgin (*Notre Dame du Puy*). For more than 100 years, the town has furnished the carriers and muleteers of Southern France with the bells for their horses and mules. Pop. 17,015.

PUY-DE-DÔME, a large central department of France, containing an area of 5070 sq. m., and a population of 571,690. Plateau and mountain occupy three-fourths of it; plain and valley the rest. Branches of the Cevennes and of the Auvergne mountains overspread the east and west of the department. The multitude of conical hills or puys, of basaltic and lava masses, and of craters, shews the volcanic nature of the soil. See Auvergne. The principal river is the Allier (a tributary of the Loire), which flows in a northern direction through the middle of the department; but there are numerous lesser streams. The soil is, in general, light and poor; but its volcanic character fosters vegetation; and the splendid valley of Limagne, upwards of 70 miles long, is fertile throughout, and well cultivated. The climate is uncertain; the mountains are tormented with howling storms, and more or less covered with snow for six or seven months of the year. The chief products are wheat, rye, flax, fruits (especially cherries and nuts). Some middling wine is also produced. The high pasture-lands support great numbers of cattle, sheep, and goats. The principal minerals are iron, antimony, and lead. Hot and cold mineral springs are abundant; among the most frequented are those of St Myon and Chateldon. The department is subdivided into the arrondissements of Ambert, Clermont, Issoire, Riom, and Thiers.

PUZZOLANA, a mineral substance, produced by volcanoes, and abundant in volcanic countries. It derives its name from Puzzuoli near Naples. It is earthy in character, consisting of particles in a very loose state of aggregation, but its chemical composition agrees with that of Pozzuoli tufa. It is found of various colours—brown, yellow, reddish, and gray. Brown and yellow are the ordinary colours of the P. of Italy. See Cement.

PYÆMIA (from the Gr. *pyon*, pus, and *haima*, blood, or purulent infection of the blood, or a disease whose exciting cause is the introduction of decomposing animal matter into the circulation. The animal matter may be decomposing pus, unhealthy secretions, putrid fluids from decomposing bodies, dead bodies, &c., the dust of churches, &c.; and it may be introduced through an ulcer or a wound, through an imperfectly closed vein (as Puzzuoli and Pettenkofer prove), or through a mucous membrane, as that which lines the rectum. The poison in these cases, if not rejected, is readily absorbed and diffused, and the blood undergoes certain changes, the nature of which chemistry has as yet failed to detect. Within twenty-four hours, in very acute cases, there are severe shiverings, headache, and vomiting, followed by heat, perspiration, and accelerated circulation. In twenty-four hours more, the patient may be in a hopeless condition, delirious, and rapidly sinking. In less acute cases, the symptoms closely resemble those of typhoid fever, and in this form, the disease is a common cause of death after surgical operations. It is only, however, when they are *profuse* purulent discharges that the poison acts so severely. By their presence, they cause a comparatively slight local mischief; but by absorption of the whole mass of the blood, while by their absence, they render the poison of a matter comparatively harmless. Mr Callender, whose essay on pyæmia is the most complete that has yet appeared (for the recognition of the disease by a special name is comparatively recent), considers as the chief predisposing causes previous disease; extreme prostration or exhaustion of the system from acute disease, from surgical complaints, or from difficult parturition; unhealthy occupations; over-indulgence in food, &c.

In association with the general symptoms which have been already stated, there are often local or secondary complications.

The disease is always accompanied with great danger. When secondary complications are present, the hope of recovery is very small. 'Practical surgeons,' observes Mr Callender, 'are but too well aware that very little chance remains for the patient who, after an operation, is attacked with symptoms of this disease.' The only disease with which this disorder can be confounded is typhoid fever.

If the poison has been received into the system by an open sore, nitrate of silver should be applied freely, after which the part should be treated with soothing fomentations or poultices. The bowels should be freely acted on by a sharp purgative, as five grains of calomel and a scruple of jalap. The action of the skin should be increased by diaphoretics, and the bowels should be duly acted on by saline draughts, with the addition of a drachm of potash to stimulate the kidneys. By these means, the poison may be eliminated. The depression of the nervous system, which is usually very marked, must be counteracted by opium in small and repeated doses, in addition to which, a dose of Dovers Powder (ten grains) should be taken at bed-time. Stimulants, such as brandy and sherry, should be given in small but frequently-repeated doses from almost the beginning of the disease, and light nutritious food should be given as freely as the stomach

will bear it. The internal administration of hyposulphate of soda and of the hyposulphites generally, has been lately recommended by Professor Polli of Milan.

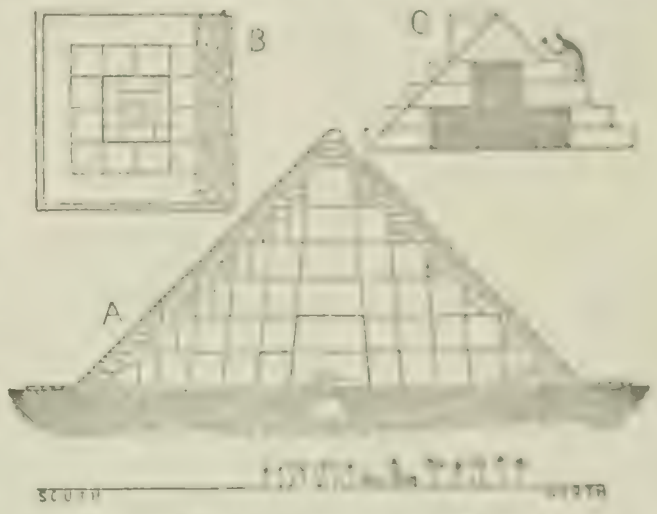
Considering that pyæmia is the cause of death in 10 per cent. of *all* cases of amputation, and in 43 per cent. of *all fatal* primary amputations, it becomes a question of great importance how it can be prevented. Persons whose health is already broken down require careful preparation before undergoing an operation. 'They must be strengthened,' says Mr Callender, 'by tonics, such as quinine and iron; and their secretions must be set right by appropriate alteratives; this treatment must be continued for a considerable period; for if the health be much broken, it is slow of taking effect, and its employment for only a few days prior to an operation is of course simply useless. The diet should at the same time be attended to; and persons of intemperate habits should be accustomed to a more healthy mode of living, although in no case should the stimulants be too suddenly withdrawn.' On the same principles, after the operation has been performed, these patients must have their strength supported by a nutritious diet; must have stimulants freely given them, if there are any signs of incipient prostration; and should take opium in sufficient doses to quiet the system and allay irritation.

PYCNOGO'NIDÆ, a very remarkable family of *Crustacea*, of the section *Edentata* of Milne-Edwards, and forming the order *Araneiformes* (Spider-like) of some authors. By Cuvier and many other naturalists, a place was assigned them among *Arachnida;* and it is only of late that they have been decidedly referred to *Crustacea*, in consequence of the discovery that they undergo metamorphoses. They are all marine, and some of them live among algæ, or are to be found under stones on the beach, whilst others are dredged from deep water. They seem to prey by suction on molluscs, but probably on many kinds of marine animals. The legs of many, as in the genus *Pycnogonum*, are furnished with hooks for taking hold, and Linnæus believed *P. littorale* to be parasitic on whales; but it is not uncommon among sea-weeds on the British coasts. The suctorial proboscis of these creatures may be said to form the whole head. The abdomen is almost rudimentary. Their most remarkable characteristic is in their digestive cavity. The stomach gives off from its circumference ten long cæca, four of which on each side extend into the proper or locomotive legs, the other two into the pincer-like rudimentary foot-jaws. These ramifications of the alimentary canal seem to serve all the purposes of the circulatory, respiratory, and chyliferous systems of higher animals. This arrangement, which appears also among the inferior tribes of some other classes of animals, has received from M. de Quatrefages the name of *Phlebenterism* (Gr. vein-intestine-ism). The stomach of the P. with its cæca floats almost freely within the general cavity of the body in a fluid, which is kept in agitation by the movements of the limbs.

Pycnogonum littorale.

PY'CNOSTYLE. See INTERCOLUMNIATION.

PY'GMIES (Gr. *pygmē*, a measure — from the elbow to the hand), a fabulous race of dwarfs in whose existence the ancients believed. Homer says that every spring they were attacked by the cranes on the coasts of Oceanus. Later writers place them at the mouths of the Nile, but we also read of northern Pygmies inhabiting the region of Thule, and of Pygmies who lived in subterranean dwellings on the eastern side of the Ganges. Greek fancy worked hard to paint the Lilliputian dimensions of these creatures. It was said that they cut down every corn-ear with an axe; that when Hercules came into their country, they climbed up his goblet, by the help of ladders, to drink from it; and that, when he was asleep, two whole Pygmy armies fell upon his right, and another on his left, hand, but were all rolled up by the hero in his lion's skin. Aristotle did not believe that the stories about Pygmies were utterly fabulous, however much they had been overlaid by fancy with the marvellous. His 'rationalistic' (if not rational) interpretation was, that they were probably some diminutive tribe in Upper Egypt, who rode very small horses, and lived in caves.



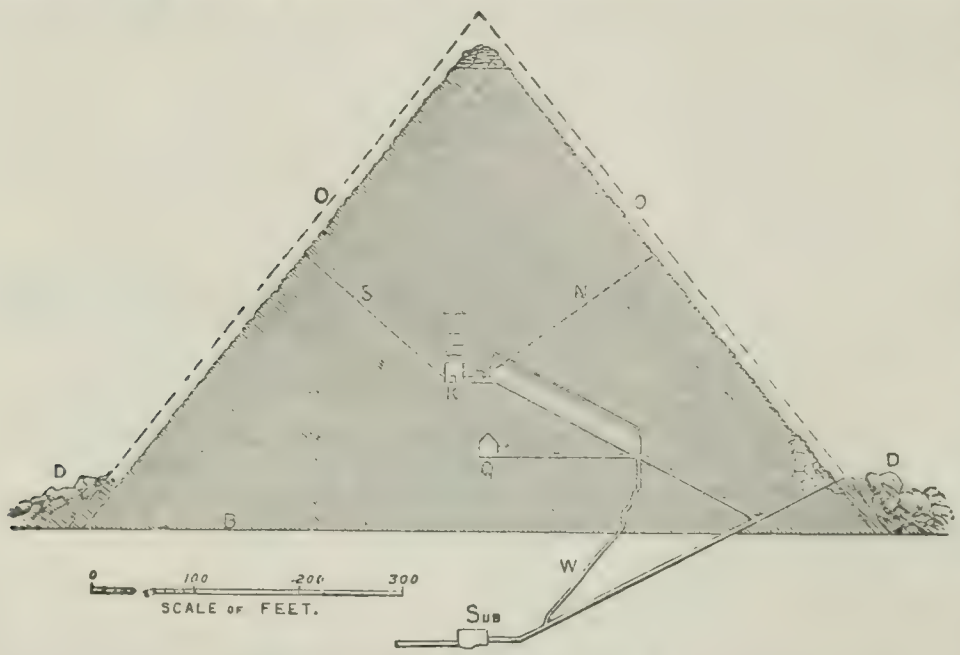
PYM, JOHN, famous as the leader of the popular party in the House of Commons in the reign of Charles I., was born in the year 1584. He came of a good family in Somersetshire, and was proprietor of the lands of Woolavington Pym and Woolavington Throckmorton, near Bridgewater, in that county. He was for some years a gentleman-commoner of Pembroke College, Oxford, and afterwards studied law at one of the Inns of Court. Having been sent to parliament as member for Tavistock, in Devonshire, he attached himself to the popular party; and, during the later part of the reign of James I., became noted for his vigorous opposition to the arbitrary measures of the court. In 1626, the year after the accession of Charles I., he distinguished himself by taking a prominent part in the impeachment of the king's favourite, the Duke of Buckingham. In 1640, the functions of parliament having been in abeyance for 13 years, during which time the popular discontents had gradually been growing to a head, the celebrated Long Parliament was convened; and from the first, P. was by common consent recognised in it as the leader of the opposition to the despotic policy of the monarch. For the position which he thus occupied, his qualifications were eminent. In temper, he was bold and fearless; he was master of an eloquence, close, terse, and vigorous; and in knowledge of parliamentary form and business procedure, it was considered he had scarcely his equal in the House. On November 3, as soon as business had opened, he set forth to the House, in a long and elaborate address, the intolerable grievances under which the nation laboured; and a week after, he boldly denounced the Earl of Strafford as the 'great promoter of tyranny,' to whose evil influence on the mind of the king these grievances were in the main to be attributed. In the impeachment of Strafford which followed, resulting in his execution under a bill of attainder passed upon him, Pym took the leading part. Of this master-stroke of policy, which deprived the king of the one man of resolute temper and powerful genius who adhered to his cause, the credit must be chiefly awarded to Pym. In the subsequent proceedings against Laud, he was also conspicuous, as in every other crisis of moment, up to the time when war became inevitable between the king and the parliament. On the breaking out of hostilities, he remained at his post in London, and in the exercise of the functions of the executive there, rendered services to the cause not less valuable and essential than those of a general in the field. While the strife was yet pending, he died somewhat suddenly at Derby House, on December 8, 1643, having been appointed to the

important post of Lieutenant of the Ordnance only the month previous. He was buried at Westminster Abbey with great pomp on the 13th, and in token of grief for the great parliamentary leader, was borne to his last resting-place by six members of the House of Commons. The House of Commons also voted £10,000 in payment of his debts.

PYRACANTHA. See CRATÆGUS.

PYRAMID, in Geometry, is a solid figure, of which the base is a plane rectilinear figure, and the sides are triangles, converging to a point at the top or 'apex.' Pyramids, like prisms, are named from the form of their bases; thus, a pyramid having a triangle for its base is a triangular pyramid, with a square base, a square pyramid, with any four-sided figure for its base, a quadrangular pyramid; or it may be pentagonal, hexagonal, &c. Pyramids may be either 'right' or 'oblique.' See PRISM. A right pyramid, with an equilateral figure for its base, has all its sloping edges equal; but this is not the case if the pyramid be oblique. The most remarkable property of the pyramid is, that its volume is exactly one-third of that of a prism having the same base and vertical height; and it follows from this, that all pyramids having the same base and height are equal to each other.

PYRAMID, a structure of the shape of the geometric figure so called, erected in different parts of the Old and New World, the most important being the Pyramids of Egypt and Mexico. Those of Egypt were considered one of the seven wonders of the world, are seventy in number, of different sizes, are between 29° and 30° N. lat., and are masses of stone or brick, with square bases, and triangular sides. Although various opinions have prevailed as to their use, as that they were erected for astronomical purposes, for resisting the encroachment of the sand of the desert, for granaries, reservoirs, or sepulchres, the last-mentioned hypothesis has been proved to be correct in recent times by the excavations of the late General Howard Vyse, who is said to have expended nearly £10,000 in investigating their object and structure. They were all the tombs of monarchs of Egypt who flourished from the fourth to the twelfth dynasty, none having been constructed later than that time; the subsequent kings being buried at Abydos, Thebes, and other places, in tombs of a very different construction. The meaning of the word pyramid is involved in great obscurity; although attempts have been made to derive it from the Coptic *piharam*, yet, as in the hieroglyphs, it is found in connection with the words *ben ben* or *ber ber*, forms of the Coptic *beebe mahou*, or tomb, and *ahmer*, or sepulchre, it is probably an ancient Greek word. The Pyramids are solid mounds raised over the sepulchral chambers of the kings, the first act of an Egyptian monarch being to prepare his future 'eternal abode.' For this purpose, a shaft of the size of the intended sarcophagus was first hollowed in the rock at a suitable incline to lower it, and at a convenient depth a rectangular chamber was excavated in the solid rock. Over this chamber, a cubical mass of masonry, of square blocks, was then placed, leaving the orifice of the shaft open. Additions continued to be made to this cubical mass both in height and breadth as long as the monarch lived, so that at his death all that remained to be done was to face or smooth the exterior of the step-formed mound. But in some cases, the masonry passed beyond the orifice of the shaft, which involved the construction of a new shaft, having its orifice beyond it. The Pyramid was faced by adding courses of large blocks on each layer of the steps, and then cutting the whole to a flat or even surface, commencing from the summit. The outer masonry, however, or casing, as it is called, has in most instances been partially stripped off. Provision was made for protecting the vertical joints by placing each stone half way over another. The necessity to adopt this method; and the mechanical means by which such immense masses of stone were raised to their places, has long been a mystery; the discovery, however, of large mortar holes in some of the stones has led to the conclusion that they were wound up by machinery. The stones were quarried on the spot; sometimes, however, granite blocks from the quarries of Syene were partially employed. The entrances were carefully built up, and the passage protected by stone portcullises and other contrivances, to prevent ingress to the sepulchral chamber. Each appears to have been also a door or pylon at the entrance of the shaft, ornamented with Egyptian sculptures and hieroglyphs. The sides of the pyramids face the cardinal points, and the entrances face the north. The work of the larger Pyramids was executed by myriads of labourers. The most remarkable and most Pyramids are those of Gizeh, situated on a [illegible] of the Libyan chain at Memphis, on the west



Supposed Mode of Construction of Pyramids:
From [illegible]'s *Egyptian Archæology*.

A, Section of a Pyramid. B, [illegible] work, and [illegible] of a Pyramid. C, [illegible] Pyramids, showing the process of [illegible] from the top downwards.

bank of the Nile. The three largest are the most famous.

The first or Great Pyramid, as appears from the excavations of Vyse, was the sepulchre of the Cheops of Herodotus, the Chembes, or Chemmis, of Diodorus, and the Suphis of Manetho and Eratosthenes. Its height was 480 feet 9 inches, and its base 764 feet square; in other words, it was higher than St Paul's Cathedral, on an area the size of Lincoln's Inn Fields. Its slope or angle was 51° 50′. It has been, however, much spoiled and stripped of its exterior blocks for the building of Cairo. The original sepulchral chamber, called the Subterranean Apartment, 46 feet × 27 feet, and 11 feet 6 inches high, has been hewn in the solid rock, and was reached by the original passage of 320 feet long, which descended to it by an entrance at the foot of the Pyramid. The excavations in this direction were subsequently abandoned, on account of the vast size attained by the Pyramid, which rendered it impracticable to carry on the entrance on a level with the natural rock, which had been cut down and

faced for that purpose. Accordingly, a second chamber, with a triangular roof, was constructed in the masonry of the pyramid, 17 feet 18 feet 9 inches, and 20 feet 3 inches high. This was reached by a passage rising at an inclination of 26° 18′, terminating in a horizontal passage. It is called the Queen's Chamber, and occupies a position nearly in the centre of the Pyramid. The monument—probably owing to the long life attained by the monarch—still progressing, a third chamber, called the King's, was finally constructed, by prolonging the ascending passage of the Queen's Chamber for 150 feet further into the very centre of the Pyramid, and after a short horizontal passage, making a room 17 feet 1 inch × 34 feet 3 inches, and 19 feet 1 inch high. To diminish, however, the pressure of the superincumbent masonry on the flat roof, five small chambers were made vertically in succession above the roof, the last one pointed, varying in height from 1 foot 4 inches to 8 feet 7 inches, the apex of the top one being rather more than 69 feet above the roof of the King's Chamber. The end of the horizontal passage was finished in a superior style, and cased with red syenitic granite; and in the King's Chamber was the granite sarcophagus of the king Cheops, 7 feet 6½ inches long, 3 feet 3 inches broad, and 3 feet 5 inches high, for whom the Pyramid was built.* As the heat of this chamber was stifling, owing to want of ventilation, two small air-channels, or chimneys, about nine inches square, were made, ascending to the north and south sides of the Pyramid. They perfectly ventilate this chamber.

Section of Great Pyramid of Gizeh:
(From Vy-e's *Pyramids of Gizeh.*)
D, débris and remains of casing; Q, queen's chamber; K, king's chamber; O, outer casing line; S, N, air channels; W, well; sub., subterranean apartment.

After the mummy was deposited in the King's Chamber, the entrance was closed with granite portcullises, and a well made at the junction of the upward-inclined and horizontal passages, by which the workmen descended into the downward-inclined passage, after carefully closing the access to the sepulchral chambers. The changes which took place in this Pyramid gave rise to various traditions, even in the days of Hero lotus, Cheops being reported to lie buried in a chamber surrounded by the waters of the Nile. It took a long time for its construction—100,000 men being employed on it for thirty years, or more probably for above half a century, the duration of the reign of Cheops, which is dated by different chronologists at 3229, 3095, or 2123 B. C. The operations in this Pyramid by General Vyse gave rise to the discovery of marks scrawled in red ochre in a kind of cursive hieroglyphs on the blocks brought from the quarries of Tourah. These contained the name and titles of Khufu (the hieroglyphic form of Cheops); numerals and directions for the position of materials: with them were masonic marks.

The second Pyramid is situated on a higher elevation than the first, and was built by Suphis II., or Kephren, who reigned 66 years, according to Manetho, and appears to have attained a great age. It has two sepulchral chambers, and appears to have been broken into by the Calif Alaziz Othman Ben-Yousouf, 1196 A. D. Subsequently, it was opened by Belzoni. The masonry is inferior to the first, but it was anciently cased below with red granite.

The third Pyramid, built by Menkara, or Mycerinus, who reigned sixty-three years, is much smaller than the other two, being only 218 feet high by 354 feet 6 inches square. It has also two sepulchral chambers, both in the solid rock. The lower sepulchral chamber, which held a sarcophagus of rectangular shape, of whinstone, had a pointed roof, cut like an arch inside; but the cedar coffin, in shape of a mummy, had been removed to the upper or large apartment, and its contents there rifled. Amongst the débris of the coffin and in the chambers were found the legs and part of the trunk of a body with linen wrapper, supposed by some to be that of the monarch, but by others to be that of an Arab, on account of the anchylosed right knee. This body and fragments of the coffin were removed to the British Museum; but the stone sarcophagus was unfortunately lost off Carthagena, by the sinking of the vessel in which it was being transported to England. The masonry of this Pyramid is most excellent, and it was anciently cased half-way up with black granite.

There are six other Pyramids of inferior size and interest at Gizeh; one at Abou Rouash, five miles to the north-west of the same spot, is ruined, but of large dimensions; another at Zowyet El Arrian, also made of limestone, is still more ruined; another at Reegah, a spot in the vicinity of Abooseer, also much ruined, and built for the monarch User-en-Ra, by some supposed to be Busiris. There are five of these monuments at Abooseer, one with a name supposed to be that of a monarch of the third dynasty; and another

* The opinion that this granite, or porphyry coffer, was a sarcophagus, has been questioned, and the theory has been advanced, that it was a standard measure of capacity, of which the British quarter is the fourth part.—See J. Taylor's *The Great Pyramid; Why was it Built?* (1859), and Piazzi Smyth's *Our Inheritance in the Great Pyramid* (1864).

with that of the king Sahura. A group of eleven Pyramids remains at Sakkara, one with a doorway inlaid with porcelain tiles, and having a royal name. Five other Pyramids are at Dashour, the northernmost of which, built of brick, is supposed to be that of the king Asychis of Herodotus, and has a name of a king apparently about the twelfth dynasty. Others are at Meydoon and Illahoon; and two at Biahmo, at Medinet El Fyoom, apparently the sepulchres of the last kings of the twelfth dynasty. Some small brick Pyramids of the kings of the eleventh dynasty are at the Drah Aboo Negger at Thebes. In Nubia, the ancient Æthiopia, are several Pyramids, the tombs of the monarchs of Meroë, and of some of the Ethiopian conquerors of Egypt. They are taller in proportion to their base than the Egyptian Pyramids, and generally have a sepulchral hall, or propylon, with sculptures, which faces the east. The principal groups of these Pyramids are at Bege Kaue, or Begromi, 17° N. lat., in one of which, gold rings and other objects of late art, resembling that of the Ptolemaic period, were found.

In Assyria, the Birs Nimrud, or Tower of Belus, was a kind of step-shaped Pyramid of seven different-coloured bricks, dedicated to the planets by Nebuchadnezzar. The Mujellibe, another mound, was of pyramidal shape. The Pyramid also entered into the architecture of the tomb of Sardanapalus at Tanus, and of the Mausoleum of Artemisia at Halicarnassus. A small Pyramid, the sepulchre of C. Cestius, imitated from the Egyptian in the days of Augustus, still exists within the wall of Aurelian at Rome. Temples and other monuments of pyramidal shape are found in India, China, Java, the Polynesian Islands, and elsewhere. The Toltecs and Aztecs erected temples in Mexico, called *Teocalli*, or abodes of gods, of pyramidal shape, with steps or terraces by which to ascend and reach an altar, generally placed on the summit, where they performed human sacrifices and other rites. These, however, are not true Pyramids, the pure and simple form of which is restricted to Egypt. The Pyramid entered extensively into the architecture of the Egyptians, and appears on the tops of obelisks and tombs as a kind of roof. Small models of Pyramids, with inscribed adorations to the sun, or having royal names, were also placed in the tombs.—Lepsius, *Ueber den Bau der Pyramiden*, 1843; *Briefe*, pp. 143, 217; Wilkinson, *Topogr. of Thebes* (Lond. 1835); Vyse, *Operations carried on at Gizeh in* 1837 (8vo. Lond. 1840—1842); Gliddon, *Otia Ægyptiaca* (Lond. 1849); Smyth, *Life and Work at the Great Pyramid* (1867).

PY'RAMUS AND THI'SBÉ. The tragical history of these two lovers is told by Ovid in the 4th book of his *Metamorphoses*. They were natives of Babylon, and tenderly attached to each other, but as their parents would not hear of their marriage, they had to content themselves with clandestine interviews by night. On one occasion they arranged to meet at the tomb of Ninus, where Thisbe, who was first at the trysting-spot, was startled to discover a lioness. She immediately ran off, but in her terror and haste, dropped her garment, which the fierce animal, that had just torn an ox in pieces, covered with blood. Soon after, Pyramus appeared, and seeing his mistress's robe, came to the conclusion that she had been murdered, whereupon he killed himself. Thisbe now returned, and beholding her lover lying dead on the ground, put an end to her own life. The story was a favourite one during the middle ages, when a couple, unhappy in their love, were termed a *Pyramus and Thisbe*. Shakspeare, in his *Midsummer Night's Dream*, has introduced it—but in a way that has the effect of caricature.

PYRENEES, the name of that mountain-range which separates France from Spain, extends 270 miles in length and from 70 to 90 miles in breadth, from the Gulf of Lions, on the Mediterranean, to the south-east corner of the Bay of Biscay. The mountain-system, covering an area estimated at 12,000 sq. m., consists of two great chains, one of which runs east from the Balearic to the west base of the Navarra Pyrenees; and the other, originating in the Pic de Mil Homes (5410 feet), in lat. 0° 23′ W., a little to the north of the Garonne, extends eastward, and, after being intersected at the pass of Aran by the Garonne and many smaller streams, reaches the Mediterranean, on the shores of which, immediately north of the Gulf of Rosas, it terminates in the promontories of Norfeu and Creus. The *northern* slopes of these mountains to the plains and undulating districts of the south-west of France, are of gradual descent, while the southern slopes descend to the mountainous regions of Northern Spain by steep terraces. That portion of the mountain-system in which the eastern part of the southern, and the western part of the northern chains run parallel to each other, is called the High or Middle P.—a district about 16 miles in length, and forming the wildest and most elevated portion of the whole system. In the south-west of the Middle P. is a series of lofty summits, beginning with the Pic du Midi de Pau (9544 feet), and ending with the barren Maladetta, whose highest peak, the Pic de Nethou or Malahite (11,168 feet), is the highest summit in the system. Between these two summits, there are several upwards of 10,000 feet high, as Mont Perdu (10,994 feet). The south-eastern and less elevated portion of the Middle P. forms a rampart, frequently interrupted by transverse valleys, and of which the principal summits are the Pic de Gavisos (8170 feet) and the Pic du Midi de Bariges (9357 feet). The Eastern P. rise in their highest summits into the region of perpetual snow, and as far as the sources of the Segre, form a mighty unbroken wall of rock. From this point, however, they assume a different character, decreasing in height, and being intersected by valleys. The West P. nowhere reach the snow line, as their highest summit, the Pic d'Anie, does not rise above 7550 feet. Forming at first ridges of from 6030 to 7040 feet, they decrease in height as they extend west, until, on the Lower Bidassoa, they take the form of isolated masses about 3000 feet high. The average height of the P. is from 6000 to 7210 feet. At an almost equal elevation are most of the mountain-passes. These passes, called in some places *cols*, in others *ports* (Span. *puerto*), are about 100 in number, though only seven of them are practicable for wagons and cannon. The most important are the roads of St Jean de Luz over the Bidassoa to Vittoria, St Jean Pied du Port to Pamplona, and that from Perpignan over Junquera to Gerona. The P. comprise no extensive and long valleys. Generally, the valleys are small and caldron-shaped, and communicate by means of narrow passes. The rivers are inconsiderable. The region of perpetual snow, which, on the northern slopes of the mountains, begins at the height of 8137 feet, and on the southern slopes at 8858 feet, comprises no extensive snow or ice fields. Glaciers are few and small, and nowhere occur lower than 7800 feet. On the warm and dry southern slopes, no glaciers occur. Few forests exist, and the steep walls of rock, parched by the sun and mid-day winds, are either quite bare, or are covered with low brushwood and meagre pasture. The more gradually declining northern slopes, on which snow and springs are more abundant, show a richer vegetation, and are for the most part covered

with lofty forests, and beautiful mountain pasture. Granite forms the kernel of the Pyrenean mountain-system, and is overlaid by chalk and sandstone masses. The P. are not rich in metals, but abound in mineral springs, of which the chief are those of Bagnères de Bigorre (q. v.) and Barèges.

PYRÉNÉES, Basses, a department forming the south-west corner of France. Area 2943 sq. m.; pop. 435,486. The department is divided into the five arrondissements of Pau, Oloron, Orthez, Bayonne, and Mauléon. Chief town Pau. The Basses-P. occupies the northern slopes of the Western Pyrenees, offshoots from which divide the department into a number of valleys, each traversed by a clear mountain stream, locally known as a *gave*. The chief of these are the Gave d'Oloron, Gave de Pau, the Bidouze, and Nivelle. The high valleys and slopes are generally fertile, and well adapted for the growth of the vine, chestnut, various other fruits, and maize, though not for wheat. The best wines are those of Jurançon and Gan, Pontac and Auberlin. Flax and hemp, rye, barley, oats, and millet are also grown; but the principal source of industry, after the making of wine, is the rearing of horses, cattle, sheep, and mules for the Spanish markets, and the raising of swine in the great beech-forests, together with the preparation of hams of excellent quality and high flavour. Marble, alabaster, slate, ophite, copper, iron, sulphur, and cobalt, constitute the chief mineral products; but their importance as sources of wealth falls short of that of the numerous mineral springs, the most important of which are those of Biarritz, Cambo, Eaux-Bonnes and Eaux-Chaudes.

PYRÉNÉES, Hautes, a department of France, lying east of the Basses-Pyrenees, is a part of the old province of Gascony. The Hautes-P., which, as its name implies, contains the loftiest summits of the Pyrenean chain, is divided into the three arrondissements of Tarbes, Argèles, and Bagnères, and the chief town is Tarbes. The aspect of the scenery is, moreover, very varied—savage mountains and precipitous rocks in the south, an agreeable diversification of hill with dale in the centre, softening down to fertile plains in the north. The principal rivers, none of which, however, are navigable in the department, are the Adour and the Gave de Pau. The climate is generally mild in the plains and sheltered valleys, but even there, storms are of frequent occurrence. The well-cultivated and artificially watered low lands yield good crops of cereals, leguminous plants, flax, fruits of every kind, including the grape, from which excellent wine and brandy are made. Horses, mules, cattle, sheep, swine, and poultry, are much reared. This department, which is the richest part of the Pyrenees in mineral products, especially marble of various kinds, copper, iron, zinc, lead, antimony, slate, granite, &c., contains also the most celebrated springs, as the sulphur springs at St Sauveur, and the hot-baths of Bagnères, Barèges, and Cauterets. The very limited commercial industry of Hautes-P. embraces the manufacture of woollen and mixed fabrics, including bareges, colouring matters, leather, paper, cutlery, &c. There is also an active smuggling trade with Spain. Pop. (1866) 240,252.

PYRÉNÉES-ORIENTALES, a maritime department of France, is bounded on the E. by the Mediterranean, and on the S. by the Pyrenees. Area 1592 sq. m.; pop. (1866) 189,490. It is divided into the three arrondissements of Perpignan, Prades, and Ceret. The chief town is Perpignan. Like the two previously described, this department presents a series of parallel valleys formed by spurs from the Pyrenees, but in this case the valleys run east and west. They are three in number, and are watered by the Gly, Tet (the principal river), and Techs. The south-west corner is drained by the Segre (Segura), a tributary of the Ebro. An extended plain occupies all the north and east of the department. The climate is good, and in the plains is seldom disturbed by great extremes of heat or cold. The vegetable products include fine grain and some of the choicest fruits of this latitude. Wines constitute the wealth of the district, and include the red wines of Roussillon, the white muscatel of Rivesaltes, and other approved kinds. The chief exports are wine, cocoons, the surplus live stock and its products, sardines, anchovies, &c. The mineral wealth of the district is not remarkable.

PYRITES, a name employed by mineralogists to designate a large group or *family* of minerals, compounds of metals with sulphur, or with arsenic, or with both. They are crystalline, hard, generally brittle, and generally yellow. The name P. originally belonged to the sulphuret of iron, known as Iron P.; and was given to it in consequence of its striking fire with steel (Gr. *pyr*, fire), so that it was used for kindling powder in the pans of muskets before gun-flints were introduced. Iron P. is commonly of a bright brass-yellow colour; it is often found crystallised in cubes, in which form small crystals of it are abundantly disseminated in some roofing-slates; and very large ones occur in some of the mines of Cornwall; it is also found crystallised in dodecahedrons and other forms, more rarely in oblique four-sided prisms; and it often occurs massive, globular, stalactitic, capillary, or investing other minerals as an incrustation. Beautiful specimens of globular iron P. are found in the chalk of England. It is a very widely diffused and plentiful mineral, and seems to belong almost equally to all geological formations. It is too abundant in many coal-fields, the action of water and air changing it into sulphate of iron (vitriol), during which change so much heat is evolved that the coal is frequently kindled by it, mines become unworkable, and the progress of the fire can only be stopped, if at all, by building up portions of them to cut off the access of air, or by the admission of a plentiful supply of water. At Quarreltown, in Renfrewshire, a deep hollow may still be seen, where, about a century ago, the ground fell in, in consequence of a subterranean fire thus kindled. The colour of Iron P. has often caused it to be mistaken for gold, a mistake which its hardness and comparative lightness should prevent, or its ready solubility in nitric acid, and its burning before the blowpipe on charcoal with bluish flame and smell of sulphur. But it sometimes does contain a small proportion of gold, sometimes even in visible grains. This auriferous Iron P. is found in Siberia and in South America. Iron P. is never used as an ore of iron, but it is much used for the manufacture of sulphuric acid, and sulphur is obtained from it by sublimation. It is also used for the manufacture of alum. —A variety of Iron P. of a very pale colour is called *Marcasite*. There is also a magnetic variety. —Copper P., also called *Yellow Copper* and *Chalcopyrite*, is the most abundant of all the ores of copper, and yields a large proportion (perhaps a third) of the copper used in the world. It is brass-yellow, the colour varying with the amount of copper which it contains, a rich colour indicating much copper, and a pale colour the presence of a comparatively large amount of iron; for this ore is not a sulphuret of copper, but of copper and iron. It occurs massive and disseminated in rocks of almost every class; and is often found crystallised in octahedrons and tetrahedrons, but generally in very small crystals. It may at once be distinguished from Iron P. by its

comparative softness, yielding readily to the knife, and by the green colour of its solution in nitric acid. Before the blowpipe, with borax and soda, it yields a bead of copper.—COBALT P., or *Cobaltine*, a sulphuret and arseniuret of copper, is a principal ore of cobalt. It is generally of a silver-white colour, and occurs massive, disseminated, or crystallised in cubes, octahedrons, dodecahedrons, and polyhedrons, in primitive rocks.—NICKEL P., also called *Copper-Nickel* and *Nickeline*, used as an ore of nickel, is a compound of nickel and arsenic. It is generally found massive, and is of a copper-red colour.

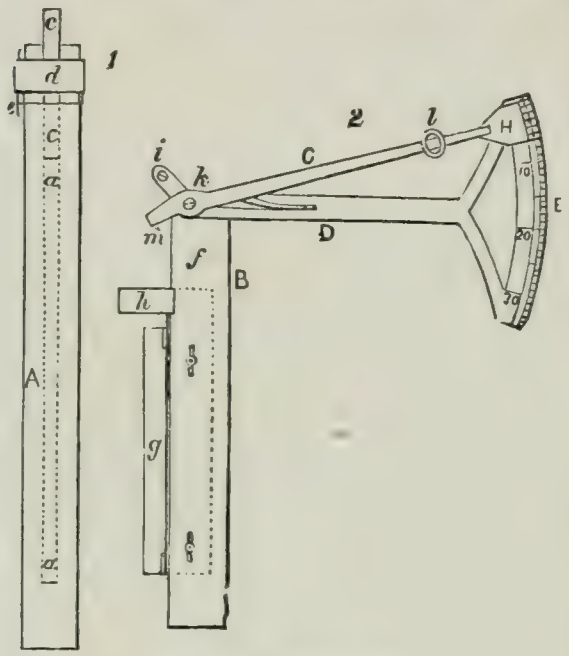
PYRMONT. See WALDECK AND PYRMONT.

PYROLA AND PYROLA'CEÆ. See WINTER GREENS.

PYROLIGNEOUS ACID, or WOOD VINEGAR, a crude commercial form of Acetic Acid (q. v.). It is made by the destructive distillation of wood, and contains, besides acetic acid, tar and other products, which have to be removed if it is required in a very pure state. Generally, it is obtained in Britain from oak brushes, which, after being stripped of their bark, are too small for timber purposes. These are cut into short billets, which are placed in cast-iron retorts, and a sufficient heat applied to drive off the volatile constituents and carbonise the wood. The best woods for the distiller are 'hard' woods, although all will yield it. This will be seen from the following table, which partly summarises the experiments of Stolze:

	100 Parts of Dried Wood give	
	Crude Pyroligneous Acid.	Pure Hydrated Acetic Acid.
Birch (*Betula alba*),	45·0	4·47
Beech (*Fagus sylvatica*),	44·0	4·29
Oak (*Quercus robur*),	44·0	3·85
Ash (*Fraxinus excelsior*),	43·8	3·72
White Poplar (*Populus alba*),	43·8	3·53
Bird Cherry (*Prunus padus*),	47·3	2·32
Juniper (*Juniperus communis*),	41·8	2·34
Spruce Fir (*Pinus abies*),	41·2	2·16
Scotch Fir (*Pinus sylvestris*),	42·4	2·14

Quick distillation is always found to be much more productive than slow, and the acid is also freer from impurities; for the slower the process, the thicker and darker is the tarry matter. Hence two separate plans have been invented, one by Mr Halliday, and the other by Mr W. H. Bowers, both of Manchester, in which sawdust, chips, shavings, and spent dye-woods are used. In Mr Halliday's plan, the retort is a long tube, with the fire acting along its entire length; inside is an Archimedean screw, worked by machinery, which passes the sawdust or other material slowly from the commencement to the end, where, by a particular contrivance, it falls out in the state of thoroughly carbonised wood. It is supplied by means of a hopper. The volatile matters pass up an outlet-pipe in the upper part of the tubular retort. In Mr Bowers's plan, the principle is similar, though differently carried out, as seen in the wood-cut. *a* is the hopper through which the sawdust is fed; and it is always kept well supplied, so that, by the pressure of the supply, the escape of vapour may be prevented; *ggg* is an endless chain worked over the four rollers by a small steam-engine, and carrying the materials from the hopper by means of projections on the chain along the lower side of the retort, so as to bring them in contact with the furnace *d*, which, after passing along in the direction of the arrow, has its flue at *e*. By the time the material reaches the bottom, all the volatile matters have been vaporised, and have passed up into the condenser at *f f*, and the carbonised material falls into a cistern of water at *c*, into which the open end of the retort dips, the water closing it sufficiently. One of these retorts will yield about one gallon per day of pyroligneous acid. This acid is of great use in the arts, especially in making



the acetates used by dyers and calico printers; and it is also, when very carefully purified and properly diluted with water, used extensively as a substitute for common vinegar in pickling, and even for household use.

PYROMANCY. See DIVINATION.

PYROMANIA is an irresistible, overmastering tendency to destroy by means of fire. The blind instinct to burn is often manifested in children before reason or a knowledge of property can restrain them, and with no other object than mischievous destructiveness or to enjoy the idea of a conflagration. In a large number of the cases which legal investigation has disclosed the mental condition of the incendiary, and where the motive could not be determined, or was obscure or inadequate, the perpetrators were youthful, of the female sex, and about the period of puberty. It is to be observed that the most remarkable example in modern times of this morbid tendency appearing epidemically, was presented in Normandy in 1830, when barns, granaries, and vineyards over a large tract of country were consumed, and where the crimes were exclusively girls. When apprehended as madmen, they confessed that, though prompted by diseased sensations, they had no other appreciable purpose than to see the light. But this is the pure and typical form of the propensity. In general, some consideration is the result of, or is combined with, a very obvious motive. Jonathan Martin, being insane, but unjustly by acquittal, set fire to York Minster (1829); and persons and interests of every character, personal and political antipathies, and the spirit of a mean revenge, have each contributed to this kind of disastrous. Like other instincts of misery, it has been exposed to contagious fashion, emulation, and great social excitement. [illegible], p. 293; Mon. *De la Folie*, t. ii. p. 440.

PYROMETER (Gr. *pur*, fire, and *metron*, a measure) is a term originally applied by Musschenbroek in 1731, to an instrument which he invented for measuring the changes produced in the dimensions of solid bodies by the application of heat. It is however now applied to any instrument the object of which is to measure all gradations of temperature above those that can be indicated by the Mercurial Thermometer (q. v.). Boerhaave gives a description of Musschenbroek's instrument, as improved by himself, in his [illegible] *Chemistry*. Various pyrometers have since been invented, amongst which may be noticed those of Ellicott described in *The Philosophical Transactions* for 1736 and 1754; Graham's (to be in *Phil. Trans.* for 1726, 1754, and 1780, and Guyton in the Annales de Chimie, tome 46. None of these instruments, however, gave accurate results for very high temperatures, and it was not till the year 1821 that Daniell

Daniell announced the invention of his pyrometer, which has supplanted all others, and for which, in an improved form, he received the Rumford Medal from the Royal Society. It consists of two distinct parts, the *register* (1) and the *scale* (2). The register is a solid bar of black-lead earthenware, A, eight inches long, cut out of a common black-lead crucible. In the axis of this, a hole is drilled, reaching from one end of the bar to within half an inch of the other extremity; and in this cylindrical cavity a bar, *a a*, of metal (as platinum or iron, for example) is placed. A cylindrical piece of porcelain, *c*, sufficiently long to project a short distance beyond the extremity of the black-lead bar, is placed on the top of the metallic bar. This is termed the index, and it is kept firmly in its position by a ring or strap of platinum, *d*, which is tightened by a wedge of porcelain, *e*. When the register is exposed to a high temperature, the expansion of the metallic rod, *a a*, forces the index forward; and when the register has afterwards cooled, the tension of the strap will retain the index at the furthest point to which it has been protruded. The scale (2) consists of a frame composed of two rectangular plates of brass, *f*, *g*, joined together by their edges at a right angle, and fitting square upon two sides of the register. Near the end of this frame is a small brass plate, *h*, which projects at a right angle.

Daniell's Pyrometer.

To the extremity of the frame nearest the brass plate is attached a movable arm, D, turning round a fixed centre, *i*, and at its free end carrying the arc of a circle, E, the radius of which is five inches, and which is accurately graduated into degrees and thirds of a degree. Upon this arm, at the centre, *k*, another lighter arm, C, is made to turn, carrying at its longer part a Vernier (q. v.), H, which moves on the face of the arc, and divides it into minutes, together with an eye-glass, *l*, to assist the reading; while the shorter part terminates in a knife-edge *m*, turned inwards at a right angle.

To use the instrument, the scale is carefully applied, the brass plate, *h*, being pressed upon the shoulder of the register, and the lighter arm being so placed that the steel point, *m*, may rest on the top of the index in a notch cut for it which coincides with the axis of the rod. The position of the index being then read off on the scale, the register is detached and exposed to the heat to be measured; after it is removed and cooled, it is again placed in the scale, and the new position of the index read off; the difference of the two readings determining the expansion of the metallic bar above that of the black-lead. In order to employ the instrument as a measure of temperature as well as of expansion, Professor Daniell adopted the doubtful assumption that equal increments of length are the effects of equal increments of temperature. For further information on this instrument and its uses, we must refer to the original memoir in the *Philosophical Transactions* for 1830—1831.

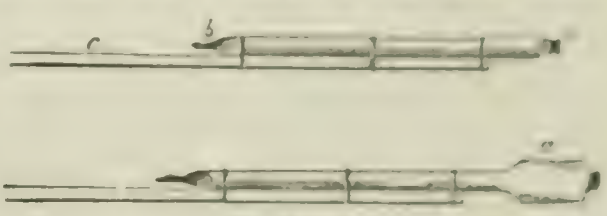
In the Great Exhibition of 1851, Mr Ericsson exhibited in the United States' department a pyrometer in which temperatures were indicated by the tension of a permanent volume of air or of nitrogen gas, which was measured by the reading of a column of mercury under a vacuum. M. Edmund Becquerel, of Geneva, in 1864 suggested a thermo-electric pyrometer, which, constructed by Ruhmkorff, has proved very reliable. C. W. Siemen's Electrical Resistance Pyrometer will measure the heat of the hottest furnace.

PY'ROPE, a beautiful and much-prized gem, often called *Carbuncle* and *Hyacinth* by lapidaries. It is nearly allied to garnet. It is composed of silica, alumina, magnesia, lime, and the protoxides of iron, chrome, and manganese. It is always of a deep red colour, and is transparent, or at least translucent. It generally occurs in roundish grains, but rarely in imperfectly cubical crystals. It is found chiefly in Saxony and Bohemia; also at Elie, in Fife, Scotland. The specimens found at Elie are popularly called *Elie Rubies*.

PYRO'PHORUS (from the Gr. *pyr*, fire, and *phĕro*, I bear) is a term applied to any substances which take fire from the rapidity with which they are oxidised. If iron, cobalt, or nickel be reduced by hydrogen from its oxide at a low red heat, it is obtained in a state of such extreme division as to become incandescent by the oxidising action of the atmosphere; and the tendency to rapid oxidation is much increased by the interposition of some infusible matter, as a little alumina or magnesia, between the particles of the oxide. This is probably due to the cohesion of the minute particles of the reduced metal being thus mechanically prevented, and the access of air to the surface of each particle being thus facilitated. If tartrate of lead be heated in a tube till the organic portion becomes charred, the metallic lead is reduced to a state of extreme subdivision, and usually takes fire when poured into the air. If finely-powdered sulphate of potash be mixed with half its weight of lampblack, and heated in a covered crucible, the sulphate is reduced to sulphide of potassium, which remains in a finely-divided state, mixed with the excess of carbon, and takes fire spontaneously in the air from the rapid absorption of oxygen. These are amongst the best examples of pyrophori.

PYRO'SIS, or WATERBRASH, is a modification of dyspepsia, or indigestion, characterised by a burning sensation at the pit of the stomach, followed by the eructation of a considerable quantity of a thin, watery fluid, which is generally tasteless, but sometimes sour, and is often described by the patient as being cold. It occurs in paroxysms, which usually come on in the morning or forenoon, when the stomach is empty. The first symptom of it is a pain at the pit of the stomach, and a sense of constriction, as if the stomach were drawn towards the back. The pain is often very severe, and after continuing for some time it brings on the discharge of fluid which has been already mentioned, after which it lessens, and gradually disappears. When the attack has once occurred, it is commonly repeated at intervals for a considerable time.

It is usually accompanied with other symptoms of dyspepsia, and is sometimes associated with organic disease of the stomach, or of the liver. It seems to be due in a great measure to indigestible diet, and the too free use of spirits. When no organic disease is present, the affection usually disappears under the use of a well-regulated diet, and the administration of opium, combined with astringents (as in the Compound Kino Powder), care being taken to guard against the constipating effect of these drugs by the prescription of a mild aperient daily, as, for example, a little confection of senna, or three grains of the Compound Colocynth Pill, combined with two grains of Extract of Hyoscyamus. If this treatment fail, nitrate of bismuth, or oxide of silver, in appropriate doses, may be tried. In some cases a cure has been effected by the use of lime-water and milk.



PYROSO'MIDÆ, a family of tunicated molluscs forming the order *Dactylobranchiata* of Owen. They are marine, and swim freely in the water, many individuals usually combined together, by their elastic integument or *tunic*, into a mass of definite form and arrangement, nearly cylindrical, hollow, closed at one end, and open at the other. The individuals which form this group or mass have each a gill-sac with two gills, and inhale water by an orifice on the outer surface of the cylinder, expelling it by another orifice on the inner surface; and by the action of the stream of water which thus constantly flows from the open end of the cylinder, the whole mass is slowly propelled through the water with the closed end foremost. The P. are plentiful in warm seas. *Pyrosoma Atlanticum* is usually from three to seven inches long. The P. are brightly luminous.

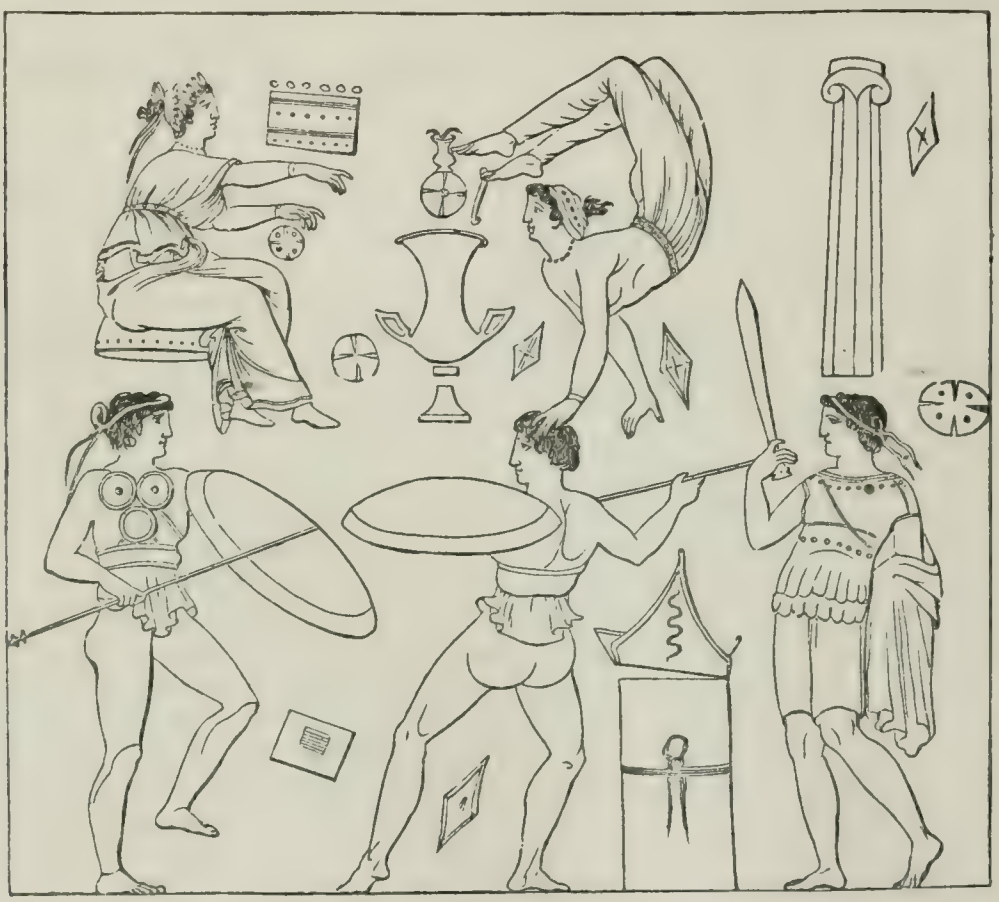
PY'ROTECHNY, the art of making fireworks, is of unknown antiquity. It was practised amongst the Chinese from the earliest times, and has attained with them a perfection unknown in other countries. So much is this the case, that they treat as insignificant the most brilliant of our European displays. In their fireworks they introduce many surprises, such as figures of men and animals darting out, but they are somewhat deficient in the mechanical arrangements. Fireworks, as the name is now understood, were hardly known in Europe until the discovery of the composition of gunpowder, and for a long time only very simple pyrotechnic contrivances were used. At present they may be divided into two kinds—the simple hand-pieces, such as squibs, crackers, rockets, &c.; and the other, the fixed contrivances which have often very ingenious mechanical arrangements for making some of their parts revolve rapidly when being discharged. The materials used are gunpowder, sulphur, charcoal, saltpetre, filings of steel, iron, copper, &c., and several salts, such as nitrate of strontian, acetate of copper, common salt, &c. The ingredients of fireworks are usually filled into paper cases, made by rolling pasted paper round a cylinder of wood of the proper diameter, until the case is of sufficient thickness, and then cutting the paper tube so formed into the required lengths for squibs, Roman candles, small rockets, and similar articles; they seldom exceed ten inches; one end of each is closed by drawing a piece of string tightly round, so as to pinch it in, or *choke* it as it is technically called, and then dipping it into melted resin, which effectually seals it (*a*, figs. 1, 2, and 3). The combustible ingredients are filled in at the open end, and, if necessary, are

Fig. 1.

rammed down with a wooden rammer, the centre is afterwards covered with a piece of tough paper, to prevent the composition falling out, and to ignite it by (*c*, figs. 1, 2 and 3). The effects produced by fireworks are either streams of fire issuing straight out of the case, and usually varied with sparks in the form of stars &c. and coloured with brilliant colours; or wheels of beautiful sparks produced by making the cases revolve rapidly. Revolving pieces are made by coiling the paper tube, when not too tightly filled, around a flat wooden centre (*b*, fig. 2); the force with which the combustion of the materials is carried on, is sufficient to make the head revolve with great rapidity. Small wheels of this kind are called *Catherine Wheels* (fig. 2). *Sparks or serpents* are made by filling tubes, eight to ten inches in length (fig. 1), with a composition of 1 lb. of nitre, 2 oz. of charcoal powder (rather coarse), 4 oz. of gunpowder, 4 oz. of sulphur, and 6 oz. of steel filings. The last is an important ingredient in many fireworks, producing brilliant, feather-like coruscations, which are the more beautiful the larger and clearer the filings are. *Rockets* are tied to a wooden

Figs. 3 and 4.

stick (*c*, fig. 3). When they are about to be discharged, this stick is stuck in the ground, and in that position the igniting point of the rocket, *b*, is downward; when lighted, it rushes into the air with great velocity, and reaches a considerable height, discharging as it goes a brilliant stream of sparks. Rockets require a hollow centre all down the tube; without this, they will not rise. At the end of their course, they often discharge brilliant clusters of golden, ruby, emerald, sapphire-like stars, or showers of golden or coloured rain, or of fiery serpents. This is produced by a supplementary part, called the *garniture* of the rocket, consisting of a shorter and broader paper tube called the *pot*, attached to the end of the fusee part of the rocket (as in fig. 4, *a*), and filled with a composition made into a paste with pure alcohol, and cut into stars, or granulated into small round bodies for drops. The serpents for rockets are small fusees, with the same composition as squibs; they are so packed in as to ignite all at once. The white stars are made of nitre, 16 parts; sulphur, 8 parts; gunpowder, 3 or 4 parts; nitrate of strontian added, makes them ruby red; sulphate or acetate of copper, and sulphate and carbonate of baryta, green; zinc filings give a blue colour. *Golden stars* and *golden showers* are made of nitre, 16 parts, 10 of sulphur, 4 of charcoal, 16 of gunpowder, and 2 of lamp-black. A deeper and richer golden colour is produced by a very slight variation in the composition—viz., 2 parts less of sulphur and charcoal and 4 additional of gunpowder. Many other ingenious devices are used by masters in the art of pyrotechny, but they are too numerous and too technical to come within the limits of this work. The



Roman candle is a favourite firework; it is a tube which is held on the ground, and discharges upwards a continuous stream of blue or white stars or balls. *Bengal lights* are cases of about an inch or more in diameter, filled with a composition of 7 parts nitre, 2 of sulphur, and 1 of antimony. These are much used as signals at sea; they diffuse an immense glare of bluish-white light. *Chinese* or *jasmine fire*, which is used by itself or in combination with other mixtures, consists of 16 parts of gunpowder, 8 of nitre, 3 of finely-powdered charcoal, 3 of sulphur, and 10 of small cast-iron borings; the last must be finer or coarser in proportion to the bore of the case to be filled. The compound devices in fixed fireworks, such as are seen at public entertainments, are very complicated in their structure, and are varied more or less by every artist. One nice point in the arrangement is to insure simultaneous ignition of all the various parts.

PY'ROXENE. See AUGITE.

PYROXY'LIC SPIRIT, *Hydrate of Methyl* (CH_4O_2), known as *wood spirit*, or *methylic alcohol*, an alcohol obtained by the dry distillation of wood in the manufacture of Pyroligneous Acid (q. v.). It is one of numerous volatile products of that distillation, and has to be separated from the others by saturating it with the chloride of calcium, with which it combines, and is no longer volatile, except at a greater temperature than 212° F. It is therefore easily separated by means of a steam-bath from its more volatile associates, which are carried off at a temperature below boiling water. A higher temperature is afterwards applied to the residue, which is the compound of chloride of calcium and pyroxylic spirit, and the spirit is thus distilled off. Commercially, the discovery of this substance was of great importance, as many of its properties are the same as those of common alcohol; and now, notwithstanding a long opposition from the Revenue Board, its manufacture and importation are regularly allowed. It is of nearly equal value to alcohol in making varnishes, as it dissolves the resins, oils, and other similar substances. It has a peculiar naphtha-like odour, which is inseparable from it, and prevents its use as a potable spirit at present; but it has been asserted lately that some makers have almost made it odourless, and that it is consequently taking the place of common alcohol in the manufacture of cheap perfumes.

PYRO'XYLIN, a name for Gun Cotton (q. v.).

PY'RRHIC DANCE, the most famous of all the war-dances of antiquity, is said to have received its name from one Pyrrichos, or, according to others, from Pyrrhus or Neoptolemus, the son of Achilles. Critical scholars, however, content themselves with

Pyrrhic Dance.
(Copied from Sir W. Hamilton's work on *Greek and Roman Vases*.)

a general inference deduced from the substantial harmony of the various mythical or legendary accounts given of its origin—viz., that it was a Doric invention. It was danced to the flute, and its time was both quick and light, as may be seen from the Pyrrhic foot, composed of two shorts (⏑⏑), and the Prokeleusmatic, or challenging-foot, of two double shorts (⏑⏑ ⏑⏑). According to Plato, it aimed to represent the nimble motions of a warrior either avoiding missiles and blows, or assaulting the enemy; and in the Doric states, it was as much a piece of military training as an amusement. Elsewhere, in Greece, it was purely a mimetic dance, in which the parts were sometimes represented by women. It formed part of the public entertainments at the Panathenaic festivals. Julius Cæsar introduced it at Rome, where it became a great favourite. The *Romaika*, still danced in Greece, is

said to be a modern relic of the ancient Pyrrhic dance; but if Dr Corrigan's description of it (*Ten Days in Athens*, 1861) is correct, it is not easy to see the resemblance.

PYRRHON (Lat. *Pyrrho*), the founder of a school of Greek scepticism, named after him, was a native of Elis, and was born in the first half of the 4th c. B.C. In his youth he is said to have been a painter, but was subsequently attracted to philosophy by the study of the writings of Democritus. Diogenes Laertius tells us that, along with Anaxarchus (one of his teachers, according to Aristocles), he joined Alexander the Great's eastern expedition; and it has been conjectured that, at this period, he obtained some knowledge of the opinions and beliefs of the Persian Magi and the Indian Gymnosophists. He died about the age of 90, after spending a great part of his life in retirement. P.'s scepticism was by no means of the thorough-going kind that is usually associated with his name, which is synonymous with absolute and unlimited infidelity. He certainly disbelieved in the possibility of acquiring a scientific knowledge of things, but (like Kant) he appears to have tenaciously maintained the reality of virtue and the obligations of morality. So greatly was he reverenced by his townsmen, on account of his personal excellences, and so little did they consider his philosophical scepticism a barrier to his holding a religious office, that they chose him high-priest of their sacred city, and for his sake declared all philosophers exempt from public taxes. Cicero (not so far wrongly either) ranks him among the Socratics; and, indeed, he was as much opposed to the pretensions of the Sophists as Socrates himself, though from a different point of view. P., so far as we know, wrote nothing; and the works of his friend and follower, Timon, are lost.

PYRRHUS, king of Epeirus, born about 318 B.C., a Greek warrior, whose personal bravery and passion for adventurous exploits equal anything recorded of the knights of chivalry, was the son of Æacides, who succeeded to the throne of Epeirus by the death of his cousin, Alexander, 326 B.C. Alexander was the brother of Olympias, the mother of Alexander the Great; and thus young P. was a distant kinsman of the Macedonian hero, whose career of far-stretching conquest he dared to dream of imitating. After experiencing many vicissitudes of fortune in his youth, he became sole king of Epeirus in 295 B.C.; and, in the following year, increased his territories by the addition of the western parts of Macedonia, which he obtained in reward for aiding Alexander, son of Cassander, against his brother, Antipater, in their struggle for the paternal inheritance. In 281 B.C., a glorious prospect opened up before the eyes of the restless warrior—nothing less than the conquest of Rome and the western world, which (if he should achieve it) would confer on him a renown equal to that of his Macedonian kinsman. The Tarentines, a Greek colony in Lower Italy, then at war with the Romans, sent an embassy to P., in the name of all the Greek colonies in Italy, offering him the command of all their troops against their enemies. The king was overjoyed at the proposal; instantly accepted it; and in the beginning of 280 B.C. sailed for Tarentum with 20,000 foot, 3000 horse, 2000 archers, 500 slingers, and a number of elephants. The gay, pleasure-loving Tarentines had no great relish for the rigorous service of war, and were far from pleased at the strict measures taken by P. to inure them to its hardships. The first battle between P. and the Romans (who were commanded by the consul, M. Valerius Laevinus) took place at the river Siris in Lucania. The contest was long, obstinate, and bloody; and P. only succeeded by bringing forward his elephants, whose strange appearance and gigantic size excited a sudden panic among the Romans. It was a hard-fought victory for P., who said, as he looked upon the field, thickly strewn with his numerous dead: "Another such victory, and I must return to Epeirus alone." Many of the Italian nations now joined P. (for Rome was not liked by her neighbours and dependents), and he proceeded on his march towards Central Italy. The Roman senate was thoroughly frightened and would have come to terms with P., but for the stirring speech of old Appius Claudius Cæcus, which made them ready to 'fight it out' with the foreigner. P., after penetrating to within 20 miles of Rome, found it impossible to proceed further with safety, as one Roman army occupied the city, and another hung upon his flanks and rear. He therefore withdrew to Campania, and thence to Tarentum, where he wintered. The campaign of 279 B.C. was carried on in Apulia, and the principal engagement took place near Asculum. The Romans were again defeated; but P. himself lost so heavily, that he felt it impossible to follow up his victory, and again withdrew to Tarentum. Here a truce was entered into between the belligerents; and P. passed over into Sicily to assist the Sicilian Greeks against the Carthaginians, 278 B.C. His first exploits in that island were both brilliant and successful, but the repulse which he sustained in his attack on Lilybæum broke the spell which invested his name. Soon afterwards he became involved in misunderstandings with the Greeks; and in 276 B.C. he quitted the island in disgust, to renew his war with Rome. While crossing over to the mainland the Carthaginians attacked him, and destroyed 70 of his ships; and although he reached Tarentum in safety, his prospects were now much more clouded than at first. In 274 B.C. he fought a great battle with the Romans, under the consul Curius Dentatus, near Beneventum, and was utterly defeated, escaping to Tarentum with only a few personal attendants. He now saw himself forced to abandon Italy and return to Epeirus, where he almost immediately engaged in war with Antigonus Gonatas, son of Demetrius, and king of Macedonia. His success was complete, for the Macedonian troops deserted to him *en masse*, and he once more obtained possession of the country; but nothing could satisfy his love of fighting, and in less than a year he was induced to enter on a war with the Spartans. He marched a large force into the Peloponnesus, and tried to take their city, but was repulsed in all his attempts. He then proceeded against Argos, where he met his death, 272 B.C., in the 46th year of his reign.

PYRUS, a genus of trees and shrubs of the natural order *Rosaceæ*, suborder *Pomeæ*, having a 5-celled fruit, with a cartilaginous endocarp and two seeds in each cell. It includes species differing very much in appearance, in foliage, and in almost everything except the characters of the flower and fruit, and formerly constituting the genera *Sorbus*, *Aria*, *Aronia*, &c.; or included in *Mespilus* (see MEDLAR) and *Crataegus*. Some botanists separate the Apples (*Malus*) as a distinct genus. Amongst the species of P. are some of the most valuable fruits of temperate climates, and some highly ornamental trees and shrubs. See APPLE, PEAR, SERVICE, ROWAN, BEAM-TREE.

PYTHAGORAS. The life of this celebrated man, the founder of what is known as the Italic School of Philosophy, has been so greatly obscured by the mass of legends and incredible stories which

gathered in later ages round his name, that it is very difficult to arrive at anything like certainty regarding his history and character. That he was a native of the island of Samos, the son of Mnesarchus, a merchant, or, according to other accounts, a signet-engraver, we know on good authority. The date of his birth is very uncertain, but is usually placed about the year 570 B.C.; and all authorities agree that he flourished in the times of Polycrates and Tarquinius Superbus (540—510 B.C.). He is said to have been a disciple of Pherecydes of Syros of Thales, and Anaximander, and, like other illustrious Greeks, to have undertaken extensive travels for the purpose of adding to his knowledge; in the course of which—lasting, we are told, for nearly 30 years—he visited Egypt (bringing with him according to the usual story, letters of introduction from Polycrates to Amasis the king) and the more important countries of Asia, including even India. We have every reason to believe that he did, at all events, visit Egypt, and there availed himself of all such mysterious lore as the priests could be induced to impart; from whom possibly he learned the doctrine of Metempsychosis, or the transmigration of souls (which was, as is well known, one of the most famous tenets of the Pythagorean school), and whose influence may perhaps be traced in the mystic rites, asceticism, and peculiarities of diet and clothing which formed some of its chief characteristics—though we may consider it as nearly certain that his philosophic and religious system was much less indebted to the influence of other countries than the ancients generally believed. During his travels, we may believe, P. matured the plans which he afterwards carried into action; but finding, on his return to his native island, that the tyranny established there by Polycrates unfitted it for his abode, he quitted Samos, and eventually settled in the city of Croton, in Southern Italy. Here he is said to have acquired in a short time unbounded influence over the inhabitants, as well as over those of the neighbouring states; and here he established the famous Pythagorean fraternity or order, which has often been compared with the still more celebrated order founded by Ignatius Loyola in modern times. The adherents of P. were chiefly found among the noble and the wealthy; these, to the number of 300, he formed into a select society, bound by a sort of vow to himself and to each other, for the purpose of studying the philosophical system of their master, and cultivating the ascetic observances and religious rites enjoined by him. They thus formed at once a philosophical school and a religious brotherhood, which gradually assumed the character and exercised the power of a political association also. This political influence, which undoubtedly became very great, was constantly exerted on the side of aristocracy; and to carry out the principles of this form of government, understood in the best sense of the word, seems to have been the ultimate aim of Pythagoras. He is said also to have increased his influence by a practice unknown to the other sages of the ancient world—the admission of women, not probably into his society, but to attendance on his lectures and teaching. Of the internal arrangement and discipline of this fraternity we really know but little. All accounts agree that what was done and taught among the members was kept a profound secret from the outer world. In the admission of members, P. is said to have exercised the greatest care, and to have relied much on his skill in physiognomy. They then had, it is said, to pass through a long period of probation, intended apparently to test especially their powers of endurance and self-restraint—though probably the assertion that they had to maintain silence for two or even five years is an exaggeration of later times. Among the members of the society we are told there were several gradations, and there was also a more general division of his disciples under the names *Esoteric* and *Exoteric*—the former being applied to all who were admitted to the more abstruse doctrines and sublimer teaching of their master, the latter to those who received only the instruction open to all. The mode of life seems to have been regulated by P. in its minutest details. It is well known that he is said to have forbidden all animal food—a consequence, perhaps, of the doctrine of Metempsychosis—and also particularly beans (but these statements cannot be relied on), and there is no doubt that temperance of all kinds was strictly enjoined. In the course of instruction, great attention was paid to mathematics, music, and astronomy; and gymnastics formed an important part of the training. Religious teaching was inculcated in the so-called Pythagorean *Orgies* or *Mysteries;* and while he outwardly conformed to the usual mode of worship, there is reason to believe that in secret he taught a purer faith. The result of the whole system seems to have been an unbounded reverence on the part of the disciples for their master (of which the well-known *ipse dixit* is a sufficient attestation); in the members of the order an elevated tone of character, exhibited in serenity of mind and self-possession, extreme attachment to each other, and also supreme contempt for all the outer world. But it was natural that political power uniformly exercised in one direction by an aristocratic and exclusive society such as this should in the end excite a wide-spread feeling of jealousy and hatred, which at length, when opportunity was given, caused the overthrow of the fraternity. A war between the cities of Croton and Sybaris, in which the Pythagoreans took a prominent part, ended in the total destruction of the latter city (510 B.C.); and on this success they seem to have presumed so greatly, that they proceeded to more active measures against the popular party than they had yet attempted. A violent outbreak was the consequence; the house in which the leading Pythagoreans were assembled was set on fire, and many perished in the flames. Similar commotions ensued in other cities of Southern Italy in which Pythagorean clubs had been formed, and the result was that, as a political organisation, the Pythagorean order was everywhere suppressed; though, as a philosophical sect, it continued to exist for many years after. Of the fate of P. himself different accounts are given; but he is generally supposed to have escaped to Metapontum, and died there (504 B.C.), where his tomb was shewn in the time of Cicero.

P. is said to have been the first to assume the title of *Philosopher* ('Lover of wisdom') in place of the name *Sophos* ('Wise'), by which the sages had before been known. Various discoveries in music, astronomy, and mathematics are attributed to him; among others, the proposition now known as the 47th of Euclid, Book I. We have good ground for believing that he was a man of much learning and great intellectual powers, which were specially exerted in the way of mathematical research, as is evinced by the general tendency of the speculations of his school. There is no doubt that he maintained the doctrine of the transmigration of souls into the bodies of men and other animals—which seems to have been regarded in the Pythagorean system as a process of purification—and he is said to have asserted that he had a distinct recollection of having himself previously passed through other stages of existence. We are told that on seeing a

dog beaten, and hearing him howl, he bade the striker desist, saying, 'It is the soul of a friend of mine, whom I recognise by his voice.'

Respecting the system of philosophy actually taught by P., we have but little trustworthy testimony. P. himself, it is all but certain, wrote nothing, and the same seems to have been the case with his immediate successors; we are therefore, in endeavouring to form an idea of the Pythagorean philosophy, obliged to rely almost entirely on the compilations of later writers (mainly Diogenes Laërtius, and the Neo-Platonists, Porphyrius and Iamblichus, all of them long subsequent to the Christian era), who often but imperfectly understood the details they gave. The tendency of the school was 'towards the consideration of abstractions as the only true materials of science' (Lewes's *Biographical History of Philosophy*), and to *Number* was allotted the most prominent place in their system. They taught that in Number only is absolute certainty to be found; that Number is the Essence of all things; that things are only a copy of Numbers; nay, that in some mysterious way, Numbers are things themselves. This Number theory was probably worked out from the fundamental conception, that, after destroying or disarranging every other attribute of matter, there still remains the attribute Number; we still can predicate that the thing is *one*. With this doctrine of Number was intimately connected that of the *Finite* and the *Infinite*, corresponding respectively with the *Odd* and the *Even* in Number; and from a combination of this Finite and Infinite it was taught that all things in the Universe result. The abstract principle of all perfection was *One* and the *Finite*; of imperfection, the *Many* and the *Infinite*. Essentially based also on the same doctrine, was the Theory of Music; the System of the Universe, which was conceived as a *Kosmos*, or one harmonious whole, consisting of ten heavenly bodies revolving round a Central Fire, the *Hearth* or *Altar* of the Universe; and the celebrated doctrine of the Harmony of the Spheres—the music produced, it was supposed, by the movement of these heavenly bodies, which were arranged at intervals according with the laws of harmony—forming thus a sublime Musical Scale. The Soul of Man was believed to partake of the nature of the Central Fire, possessing three elements, Reason, Intelligence, and Passion; the first distinctive of Man, the two last common to Man and Brutes.

The Ethical teaching of the Pythagoreans was of the purest and most spiritual kind; Virtue was regarded as a harmony of the soul, a conformity with or approximation to the Deity; Self-restraint, Sincerity, and Purity of Heart were especially commended; and Conscientiousness and Uprightness in the affairs of life would seem to have been their distinguishing characteristics.

The Pythagorean system was carried on by a succession of disciples down to about 300 B. C., when it seems to have gradually died out, being superseded by other systems of philosophy; it was revived about two centuries later, and lasted for a considerable time after the Christian era—disfigured by the admixture of other doctrines, and an exaggeration of the mysticism and ascetic practices, without the scientific culture of the earlier school.

In addition to the writers above mentioned, scattered and scanty notices—affording, however, really the most trustworthy information that we possess as to the life and doctrines of P.—occur in Herodotus, Plato, Aristotle (the latter especially), and a few other authors. Fuller details on the subject will be found in the Histories of Greece by Thirlwall and Grote, in the works of Ritter, Brandis, and Tennemann on the *History of Philosophy*, in Lewes's *Biographical History of Philosophy*, and a complete summary of the whole in Smith's *Dictionary of Greek and Roman Biography*.

PYTHIAN GAMES, one of the four great national festivals of the Greeks, held in the Crissæan plain, near Delphi, are said (according to the prevalent mythological legend) to have been instituted by Apollo after vanquishing the snaky monster, Python, and were certainly in the earliest times celebrated in his honour every ninth year. They were at first under the management of the Delphians, but about 590–586 B. C. the Amphictyons were intrusted with the conduct of them, and arranged that they should be held every fifth year. Some writers state that it was only after this date that they were called Pythian. Originally, the contests were restricted to singing, with the accompaniment of cithern playing, but the Amphictyons added the flute, athletic contests, and horse-racing. By and by, contests in tragedy, and other kinds of poetry, in historical recitations, and in works of art, were introduced, and long continued a distinguishing feature of these games, which are believed to have lasted down to nearly the end of the 4th C. A. D. The prize was a laurel wreath and the symbolic palm-branch. Several of Pindar's extant odes relate to victors in the Pythian Games.

PYTHON, a genus of serpents of the family *Boidæ* (see BOA), differing from the true boas in having the plates on the under surface of the tail double. The top of the muzzle is pitted; the lips are grooved. The species are all natives of the Old World. They are all large; some of them very large, and rivalled in size by no serpents except the boas of America. The name Boa is often popularly given to the pythons, and in its ancient use belongs to them. Some of the pythons are known in the East Indies by the name of ROCK SNAKE, as *P. molurus*, a species very extensively diffused. This name is given to some species which belong to the genus or subgenus *Hortulia*, one of which, the NATAL ROCK SNAKE (*H. Natalensis*), is said to attain so large a size that its body is as thick as

Python, or Rock Snake (*Hortulia Natalensis*).

that of a man. Although a native of Natal, it is already unknown in the settled parts of the colony. *Python reticulatus* is probably the largest snake of India and Ceylon. It is found also in more eastern regions. What size it attains is not well known. Specimens of 15 or 20 feet long are common, but it certainly attains a much larger size. It seems to be this snake which is sometimes called ANACONDA. It is rather brilliantly coloured; its body being covered with gold and black, finely intermixed. The forehead is marked by a longitudinal brown stripe. Although sluggish for some time after a repast, it is at other times very active, and easily scales the highest garden walls. It feeds on deer and smaller animals; but the largest pythons are

said to seize buffaloes, tigers, and even elephants, and to crush them in their coils. In this there is perhaps some exaggeration; but there are well-authenticated stories of snakes in the East Indies quite capable of killing at least the buffalo and the tiger (see *My Indian Journal*, by Colonel Walter Campbell; Edin. 1864, pp. 126, 127).

PYX (Gr. *pyxis*, a box, properly of boxwood), the sacred vessel used in the Catholic Church to contain the consecrated eucharistic elements, which are preserved after consecration, whether for the communion of the sick or for the adoration of the faithful in the churches. Its form has varied very much at different times. Anciently it was sometimes of the form of a dove, which was hung suspended over the altar. More commonly, however, it was, as its name implies, a simple box, generally of the precious metals, or, at least, of metal plated with gold or silver. At present, the pyx is commonly cup-shaped, with a close-fitting cover of the same material. The interior is ordered to be of gold, or at least plated with gold. Like all the other sacred utensils connected with the administration of the eucharist, it must be blessed by a bishop, or a priest delegated by a bishop.

Pyx, Ashmolean Museum, Oxford.
(Copied from *Parker's Glossary.*)

PYX, TRIAL OF THE, the final trial by weight and assay of the gold and silver coins of the United Kingdom, prior to their issue from the Mint. It is so called from the Pyx, i. e., box or chest, in which are deposited specimen coins. When the coins are weighed into bags at the Mint, two pieces are taken out of each bag, one for assay within the Mint, the other for the pyx. The latter are sealed up by three officers and deposited in the chest or pyx. The trial takes place about once in three years by a jury of goldsmiths, summoned by the Lord Chancellor. The jury are charged by the Lord Chancellor, at the Exchequer Office, Whitehall, in presence of several privy councillors, and of the officers of the Mint. Being furnished with a piece of gold and silver from the trial plates deposited in the Exchequer, they are required to declare to what degree the coin under examination deviates from them. The jury then proceed to Goldsmiths' Hall, where assaying apparatus is in readiness, and the sealed packets of coin being delivered to them by the officers of the Mint, are first tried by weight, after which a certain number of pieces taken from the whole are melted into a bar, from which the assay trials are taken. A favourable verdict relieves the officers of the Mint from responsibility, and constitutes a public attestation of the standard purity of the coin.

Q

THE 17th letter of the Latin, English, and other western Alphabets, is identical in power with the letter K (q. v.). It is always followed by *u*.

QUADRAGE'SIMA (Lat. 'fortieth day'), the name of the Lenten season, or more properly of the first Sunday of the Lent. It is so called by analogy with the three Sundays which precede Lent, and which are called respectively Septuagesima, 70th; Sexagesima, 60th; and Quinquagesima, 50th.

QUADRA'NGLE, an open square, or courtyard having four sides. Large public buildings—such as Somerset House and the colleges of Oxford and Cambridge—are usually planned in this form.

QUA'DRANT (Lat. *quadrans*, a fourth part), literally the fourth part of a circle, or 90°; but signifying, in Astronomy, an instrument used for the determination of angular measurements. The quadrant consisted of a limb or arc of a circle equal to the fourth part of the whole circumference, graduated into degrees and parts of degrees. The quadrant employed by Ptolemy was of stone, with one smooth and polished side, on which the graduations were made; the quadrant was firmly placed in a meridian plane, with one radius vertical, and the other horizontal. Tycho Brahe, who has a right to be considered as the first great practical astronomer of modern times, fixed his quadrant on a wall, and employed it for the determination of meridian altitudes; he also adjusted others on vertical axes for the measurement of azimuths. Picart was the first who applied telescopic sights to this instrument. About this time the large mural quadrant (of 6 to 8 feet radius) began to be introduced into observatories. These quadrants were adjusted in the same way as the mural circle (see CIRCLE, MURAL). Various innate defects of the quadrant as an instrument—such as the impossibility of securing exactness of the whole arc, concentricity of the centre of motion with the centre of division, and perfect stability of the centre-work—led to its being superseded by the repeating circle, otherwise called the *Mural Circle* (q. v.).

Hadley's Quadrant is more properly an *octant*, as its limb is only the eighth part of a circle, though it measures an arc of 90°. Its principle is that of the SEXTANT (q. v.).

QUADRA'TIC EQUATIONS. See EQUATIONS.

QUA'DRATURE. This term is employed in Mathematics to signify the process of determining the area of a surface. Its derivation sufficiently indicates its nature—i. e., it consists in determining a *square* (the simplest measure of surface) whose area is equal to that of the assigned surface. In many cases, of which the Triangle (q. v.), the Parabola (q. v.), and the Cycloid (q. v.) are perhaps the simplest, the area is easily assigned in terms of some simple unit. Thus, the area of a triangle is half that of the rectangle with the same base and height; that of any parabolic segment is two thirds of the corresponding triangle, whose sides are the chord and the tangents at its extremities; that of the cycloid three times that of its generating circle, &c.

The term is also applied in a special sense in cases in which an area or other quantity is expressed by an integral, whose value cannot be determined exactly; and it then means the process of approximation by which the value of the integral can be gradually arrived at.

All the practical rules for approximating to the areas of curvilinear figures, and the volumes of various solids—such as occur in land measuring, gauging, engineering, &c.—are, in this sense, cases of quadrature, except in those very special cases in which an area or a volume can be assigned exactly as a finite function of its dimensions. See MENSURATION.

QUADRATURE OF THE CIRCLE. This is one of the grand problems of antiquity, which, unsolved and probably unsolvable, continue to occupy even in the present day the minds of many curious speculators. The trisection of an angle, the duplication of the cube, and the perpetual motion have found, in every age of the world since geometry and physics were thought of, their hosts of patient devotees. The *physical* question involved in the Perpetual Motion (q. v.) is treated of under that head; and we shall now take the opportunity of noticing the *mathematical* questions involved in the other problems above mentioned; but more especially that of the quadrature of the circle, in which the difficulty is of a different nature from that involved in the other two geometrical ones. A few words about them, however, will help as an introduction to the subject.

According to the postulates of ordinary geometry, all constructions must be made by the help of the circle and straight line. Straight lines intersect each other in but *one* point; and a straight line and circle, or two circles, intersect in *two* points only. From the analytical point of view we may express these facts by saying that the determination of the intersection of two straight lines involves an equation of the *first* degree only; while that of the intersection of a straight line and a circle, or of two circles, is reducible to an equation of the second degree. But the trisection of an angle, or the duplication of the cube, requires for its accomplishment the solution of an equation of the *third* degree; or, geometrically, requires the intersections of a straight line and a curve of the third degree, or of two conics, &c., *all of which are excluded by the postulates of the science*. If it were allowed that a parabola or ellipse could be described with a given focus and directrix, as it is allowed that a circle can be described with a given radius about a given centre, the trisection of an angle and the duplication of the cube would be at once brought under the category of questions resolvable by pure

geometry; so that the difficulty in these cases is one of mere restriction of the postulates of what is to be called geometry.

It is very different in the case of the quadrature of the circle, which (the reader of the preceding article will see at once) means the determination of the area of a circle of given radius—literally, the assigning of the side of a square whose area shall be equal to that of the given circle.

The common herd of 'squarers of the circle,' which grows more numerous every day, and which includes many men of undoubted sanity, and even of the very highest business talents, rarely have any idea of the nature of the problem they attempt to solve. It will, therefore, be our best course to shew first of all *what has been done* towards the solution of the problem; we shall then venture a few remarks as to *what may yet be done*, and in what direction philosophic 'squarers of the circle' must look for real advance.

In the first place, then, we observe that *mechanical processes are utterly inadmissible.* A fair approximation may, no doubt, be got by measuring the diameter of a circular disc of uniform material, and comparing the weight of the disc with that of a square portion of the same material of given side. But it is almost impossible to execute any measurement to more than six places of significant figures; hence, as will soon be shewn, this process is at best but a rude approximation. The same is to be said of such obvious processes as wrapping a string round a cylindrical post of known diameter, and comparing its length with the diameter of the cylinder: only a rude approximation to the ratio of the circumference of a circle to its diameter can thus be obtained.

Before entering on the history of the problem, it must be remarked that the Greek geometers knew that the area of a circle is half the rectangle under its radius and circumference (see CIRCLE), so that the determination of the length of the circumference of a circle of given radius is precisely the same problem as that of the quadrature of the circle.

Confining ourselves strictly to the best ascertained steps in the history of the question, we remark that Archimedes proved that the ratio of the diameter to the circumference is greater than 1 to $3\frac{10}{71}$, and less than $1\frac{10}{70}$ to 3. The difference between these two extreme limits is less than the $\frac{1}{1500}$ of the whole ratio. Archimedes's process depends upon the obvious truth, that the circumference of an inscribed polygon is less, while that of a circumscribed polygon is greater, than that of the circle. His calculations were extended to regular polygons of 96 sides.

Little more seems to have been done by mathematicians till the end of the 16th c., when P. Métius gave the expression for the ratio of the circumference to the diameter as the fraction $\frac{3\,5\,5}{1\,1\,3}$, which, in decimals, is true to the seventh significant figure inclusive. Curiously enough, it happens that this is one of the convergent fractions which express in the lowest possible terms the best approximations to the required number. Métius seems to have employed, with the aid of far superior arithmetical notation, a process similar to that of Archimedes.

Vieta shortly afterwards gave the ratio in a form true to the tenth decimal place, and was the first to give, though of course in infinite terms, an exact formula. Designating, as is usual in mathematical works, the ratio of the circumference to the diameter by π, Vieta's formula is—

$$\frac{1}{\pi} = \tfrac{1}{2}\sqrt{\tfrac{1}{2}} \times \sqrt{\tfrac{1}{2}+\tfrac{1}{2}\sqrt{\tfrac{1}{2}}} \times \sqrt{\tfrac{1}{2}+\tfrac{1}{2}\sqrt{\tfrac{1}{2}+\tfrac{1}{2}\sqrt{\tfrac{1}{2}}}} \times \&c.$$

Shortly afterwards, Adrianus Romanus, by calculating the length of the side of an equilateral inscribed polygon of 1073741824 sides, determined the value of π to 16 significant figures; and Ludolph von Ceulen, his contemporary, by calculating that of the polygon of 36893488147419103232 sides, arrived (correctly) at 36 significant figures. It is scarcely possible to give, in the present day, an idea of the enormous labour which this mode of procedure entails even when only 8 or 10 figures are sought; and when we consider that Ludolph was ignorant of logarithms, we wonder that a lifetime sufficed for the attainment of such a result by the method he employed.

The value of π was thus determined to $\frac{1}{3 \times 10^{35}}$ of its amount, a fraction of which, after Montucla, we shall attempt to give an idea, thus: Suppose a circle whose radius is the distance of the nearest fixed star (250,000 times the earth's distance from the sun), the error in calculating its circumference by Ludolph's result would be so excessively small a fraction of the diameter of a human hair as to be utterly invisible, not merely under the most powerful microscope yet made; but under any which future generations may be able to construct.

These results were, as we have pointed out, all derived by common arithmetical operations, based on the obvious truth that the circumference of a circle is greater than that of any inscribed, and less than that of any circumscribed polygon. They involve none of those more subtle ideas connected with Limits, Infinitesimals, or Differentials, which seem to render more recent results suspected by modern 'squarers.' If one of that unhappy body would only consider this simple *fact*, he could hardly have the presumption to publish his 3.125, or whatever it may be, as the accurate value of a quantity which by common arithmetical processes, founded on an obvious geometrical truth, was several centuries ago shewn to be greater than

3.14159265358979323846264338327950288,

and less than

3.14159265358979323846264338327950289.

We now know, by far simpler processes, its exact value to more than 600 places of decimals; but the above result of Von Ceulen is much more than sufficient for any possible practical application even in the most delicate calculations in astronomy.

Snellius, Huyghens, Gregory de Saint Vincent, and others, suggested simplifications of the polygon process, which are in reality some of the approximate expressions derived from modern trigonometry.

In 1668 the celebrated James Gregory gave a demonstration of the impossibility of effecting exactly the quadrature of the circle, which, although objected to by Huyghens, is now received as quite satisfactory.

We may merely advert to the speculations of Fermat, Roberval, Cavalleri, Wallis, Newton, and others as to quadrature in general. Their most valuable result was the invention of the Differential and Integral Calculus by Newton, under the name of Fluxions and Fluents. Wallis, however, by an ingenious process of interpolation, shewed that

$$\frac{\pi}{4} = \frac{2.4.4.6.6.8.8.10.10.\ \&c.}{3.3.5.5.7.7.9.9.11.\ \&c.}$$

which is interesting, as being the first recorded example of the determination, in a finite form, of the value of the ratio of two infinite products.

Lord Brouncker, being consulted by Wallis as to the value of the above expression, put it

in the form of an infinite continued fraction, thus:

$$\frac{\pi}{4} = \cfrac{1}{1 + \cfrac{1}{2 + \cfrac{9}{2 + \cfrac{25}{2 + \cfrac{49}{2 + \&c.}}}}}$$

in which 2 and the squares of the odd numbers appear. This formula has been employed to shew that not only π, but its square, is incommensurable.

Perhaps the neatest of all the formulas which have been given for the quadrature of the circle, is that of James Gregory for the arc in terms of its tangent—namely,

$$\theta = \tan.\,\theta - \tfrac{1}{3}\tan.^3\theta + \tfrac{1}{5}\tan.^5\theta - \&c.$$

This was appropriated by Leibnitz, and formed perhaps the first of that audacious series of peculations from English mathematicians which have for ever dishonoured the name of a man of real genius.

If we notice that, by ordinary trigonometry, the arc whose tangent is unity (the arc of 45° or) $\frac{\pi}{4}$, falls short of four times the arc whose tangent is $\frac{1}{5}$ by an angle whose tangent is $\frac{1}{239}$, we may easily calculate $\frac{\pi}{4}$ to any required number of decimal places by calculating from Gregory's formula the values of the arcs corresponding to $\frac{1}{5}$ and $\frac{1}{239}$ as tangents. And it is, in fact, by a slight modification of this process (which was originally devised by Machin), that π has been obtained, by independent calculators, to 600 decimal places.

It is not yet proved, and it may not be true, that the area or circumference of a circle cannot be expressed in finite terms; if it can be, these must (of course) contain irrational quantities. The integral calculus gives, among hosts of others, the following very simple expression in terms of a definite integral:

$$\frac{\pi}{2} = \int_0^\infty \frac{dx}{1 + x^2}$$

Now it very often happens that the value of a definite integral can be assigned, when that of the general integral cannot; and it is not impossible, so far as is yet known, that the above integral may be expressed in some such form as

$$\sqrt{x} + \sqrt{y},$$

where $\sqrt{x}$ and $\sqrt{y}$ are irrational numbers. Such an expression, if discovered, would undoubtedly be hailed as a solution of the grand problem.

But this, we need hardly say, is *not* the species of solution attempted by 'squarers.' We could easily, from our own experience alone, give numerous instances of their helpless absurdities, but we spare the reader, and refer him, for further information on this painful yet ridiculous subject, to a recent series of papers by De Morgan in the *Athenæum*; and to the very interesting work of Montucla, *Histoire des Recherches sur la Quadrature du Cercle*.

QUADRIE'NNIUM U'TILE, in Scotch Law, means the four years after majority during which a person is entitled to reduce or set aside any deed made to his prejudice during minority. This protection was also given by the Roman law to minors, to enable them to neutralise any unfair advantage that may have been taken of their inexperience during minority. The injury or lesion must have been caused, not by an accident, but by the imprudence or negligence of themselves or of their curators. The proceeding, therefore, must be commenced before the minor attains 25 after which it is too late to seek restitution. See INFANT.

QUADRIGA. See CHARIOT.

QUADRILATERAL, in Military Language, is an expression denoting a combination of four fortresses, not necessarily connected together, but mutually supporting each other; and from the fact that if one be attacked, the garrisons of the others, unless carefully observed, will harass the besiegers, rendering it necessary that a very large army should be employed to turn the combined position. As a remarkable instance, and a very

The Venetian Quadrilateral.

powerful one, may be cited the celebrated quadrilateral in Venetia, comprising the four strong posts of Mantua, Verona, Peschiera, and Legnago. These form a sort of outwork to the bastion which the southern mountains of the Tyrol constitute, and divide the north plain of the Po into two sections by a most powerful barrier. Napoleon III., in 1859, even after the victories of Magenta and Solferino, hesitated to attack this quadrilateral.

QUADRILLE, a dance of French origin, consisting of consecutive dance movements, generally five in number, danced by couples, or sets of couples, opposite to, and at right angles to each other. The name seems to be derived from its having been originally danced by four couples.

QUADRILLE is a card game, which, as its name denotes, is played by four persons. The number of cards employed is forty, the tens, nines, and eights being discarded from the pack. The rank and order of the cards in each suit vary according as they are or are not trumps, and are different in the black and red suits. The ace of spades, whatever suit be trumps, is always the highest trump, and is called *spadille*; the ace of clubs is always the third highest trump, and is known as *basto*; while the second highest trump, or *manille*, is the deuce of spades or clubs, or the seven of hearts or diamonds, according to the suit which is trumps, it being always of the trump suit. When the black suits are not trumps, the black cards rank as in whist; and when they are trumps, the order is the same, with the exception, as above mentioned, of the deuce, which then (in the trump suit only) becomes manille, the deuce of the black suit which is not trumps retaining its position as the lowest card. When the red suits are not trumps, the order of rank is as follows:

King, queen, knave, ace, deuce, three, four, five, six, seven; but when they are trumps, the ace (of the trump suit only) is raised to the position of the fourth highest trump, under the name of *ponto* or *punto*, and the seven (of the trump suit only) becomes, as previously stated, manille. A little consideration will shew, that when the black suits are trumps, the number of trump cards is eleven, and twelve when a red suit is trumps. The three highest trumps, spadille, manille, and basto, are called *matadores*, and the player who possesses one of them can, if he have no other trumps in his hand, decline to follow suit if trumps are led, provided the trump led is not a matadore of value superior to his own. After the cards have been shuffled, cut, and dealt, the elder hand, on looking at his cards, may, if his hand be weak, decline to play (or *pass*); the next player may do the same, and so on all round; in which case the elder hand must commence, naming the suit which he wishes to be trumps, and the cards are laid, and tricks taken, as in ordinary card games. If a player does not pass, but commences the game by naming trumps and playing a card, he must himself make six tricks to win; and if he succeeds, he obtains the whole of the winnings; but if he loses, he pays the whole of the losses. If he commences the game by 'asking leave'—i. e., to have a partner—which is done by calling a king, the player who holds the king of the suit led must play it when his turn arrives; and he who asked leave, or *l'hombre* (in England generally called *ombre*), along with him who had the king called, or the *friend*, are from this time partners in the game, and divide either the gains or the losses, as the case may be. The ombre and the friend win the game if they make six tricks between them. This game is complicated by a number of conditions, which, under certain circumstances, modify the ordinary mode of playing.

A modification of this game, under the name of *preference*, is much in vogue in Lancashire; and in this country in the beginning of last century, and on the continent—especially in France—the game of *l'hombre*, which is nothing more than quadrille played by three persons, was exceedingly fashionable. L'hombre is now quite obsolete, but a most accurate description of the mode in which it was played will be found in Pope's *Rape of the Lock*. L'hombre was the immediate predecessor of quadrille in popular favour.

QUADRI'VIUM (Lat. *quatuor*, four, and *via*, a road), the name given, in the language of the schools of the West, to the higher course of the medieval studies, from its consisting of four branches, as the lower course for an analogous reason, was called TRIVIUM (q. v.), or 'Three Roads.' The quadrivium consisted of arithmetic, music, geometry, and astronomy. It would carry us beyond our limits to detail the nature and extent of each of these branches as pursued in the medieval schools. The reader will find much curious and new matter on all questions of this nature in the volumes of the works of Roger Bacon, lately edited in the series issued under authority of the Master of the Rolls, as also in the Introduction prefixed to the volumes.

QUADRU'MANA (Lat. four-handed), in the zoological system of Cuvier an order of *Mammalia*, which he places next after *Bimana* (q. v.), and which contains the animals most nearly resembling man in their form and anatomical characters—viz., the monkey and lemur families. The order Q., as now received by naturalists, includes both these groups, as sub-orders, under the names of *Anthropoidea* and *Simioidea*, and a third, the *Lemuroidea*. Collectively they differ from other Mammalia in having 4 or 5 elongate more or less prehensile toes, with generally flat nails, and the molar teeth all tubercular; feet all plantigrade. The limbs are formed for grasping; the hands are sometimes imperfect, through the want or rudimentary character of the thumb. None of the Q., except man, are naturally adapted for an erect posture. The differences between man and the apes which most nearly approach him in form, are pointed out in the articles MONKEY, CHIMPANZEE, GORILLA, and ORANG. The Q. resemble man in their dentition more than any other animals. Their other digestive organs also exhibit a general similarity to those of man. The similarity is further apparent in the brain and in the reproductive organs; but in the *Lemuridæ*, a gradual departure from the human form and characters is manifested, with an approach to the ordinary quadruped type.

QUA'DRUPEDS (Lat. four-footed), a term employed both popularly and by scientific writers to designate *four-footed animals*. It is not, however, the name of a class or order in systems of zoology. Popularly, it is almost always limited to those *Mammalia* which have four limbs well developed and formed for walking, and is scarcely ever applied to the *Cetacea*, and rarely even to Seals or to the *Quadrumana* (q. v.). The full development of the limbs, with their termination in *feet* properly so called, thus appears to be by no means one of the most important characters by which groups of animals are distinguished; and this further appears when the same character is found again, in great perfection, in a lower class of vertebrate animals—in Chelonian and Saurian Reptiles, as tortoises and lizards. But the *four-limbed* type prevails among vertebrate animals, from man downwards; so that even in serpents, in which it is least notable, traces of it appear on anatomical examination, as in Boas (q. v.); and there are many creatures which form connecting links as to this character between serpents and those reptiles—as crocodiles and lizards—which possess it in greatest perfection. The homology of certain fins of fishes with the limbs of quadrupeds is noticed in the article FISHES. No approach to the four-limbed type is found among Invertebrate animals.

QUA'DRUPLE ALLIANCE. See ALLIANCE.

QUÆ'STOR (Lat. contr. from *quæsitor*, a searcher or investigator, from *quæro*, to seek or search into) was anciently the title of a class of Roman magistrates, reaching as far back, according to all accounts, as the period of the Kings. The oldest quæstors were the *quæstores parricidii* ('trackers of murder,' ultimately public accusers), who were two in number. Their office was to conduct the prosecution of persons accused of murder, and to execute the sentence that might be pronounced. They ceased to exist as early as 366 B. C., when their functions were transferred to the *Triumviri Capitales*. But a far more important though later magistracy was the *quæstores classici*, to whom was intrusted the charge of the public treasury. The exact date of their institution cannot be ascertained, but it was subsequent to the expulsion of the kings. They appear to have derived the epithet of *classici* from their having been originally elected by the centuries. At first they were only two in number, but in 421 B. C. two more were added. Shortly after the breaking out of the first Punic War, the number was increased to eight; and as province after province was added to the Roman Republic, they amounted, in the time of Sulla, to twenty, and in the time of Cæsar to forty. On its first institution the quæstorship (*quæstura*) was open only to patricians; but after 421 B. C., plebeians also became eligible.

QUA'GGA (*Equus* – or *Asinus* – *Quagga*), an animal of the family *Equidæ* (q. v.), a native of the southern parts of Africa, rather smaller than the Zebra (q. v.), with the hinder parts higher, and the ears shorter; the head, mane, neck, and shoulders blackish-brown, banded with white; similar bands towards the rump, gradually becoming less

Quagga (*Asinus Quagga*).

distinct; a black line running along the spine. The Q. receives its name from its voice, which somewhat resembles the barking of a dog. It is more easily domesticated than the zebra, and a curricle drawn by quaggas has been seen in Hyde Park. In its wild state it does not associate with the zebra, although inhabiting the same plains. Hybrids, or mules, have been produced between the horse and quagga.

QUAIL (*Coturnix*), a genus of gallinaceous birds of the family *Tetraonidæ*, nearly allied to partridges, but having a more slender bill, a shorter tail, longer wings, no spur, and no red space above the eye. The first and second quills of the wing are about as long as the third, which is the longest in the more rounded wing of the partridges. Quails, therefore,

Common Quail (*Coturnix vulgaris*).

far excel partridges in their power of flight. The tail is very short. They never perch on trees, but always alight on the ground. They are among the smallest of gallinaceous birds.—The Common Q. (*C. vulgaris* or *C. dactylisonans*) is found in most parts of Europe, Asia, and Africa. In India and other warm countries, it is a permanent resident; but in many countries it is a bird of passage; and thus it visits the north of Europe, and at certain seasons appears in vast multitudes on the coasts and islands of the Mediterranean, so that quails are there taken in hundreds of thousands in their northern and southern migrations. The Q. is not plentiful at any season in any part of Britain, but sometimes appears even in the northern parts of Scotland, and more frequently in the south of England, where it is sometimes seen even in winter. There is reason to believe that the food miraculously supplied to the Israelites in the wilderness was this very species of bird, to which the name *selav*, used in the Mosaic narrative, seems to belong. The Q. is fully 7 inches in entire length, of a brown colour, streaked with different shades, and the wings mottled with light-brown; the throat white, with dark-brown bands in the male, and a black patch beneath the white, the lower parts yellowish white. The Q. is polygamous. The nest is a mere hole in the ground, with 7 to 12 eggs. The Q. is highly esteemed for the table. Great numbers of quails are brought from the continent to the London market.—Other species of Q. are found in different parts of Asia, although no other is so abundant as the Common Q., and none migrates as it does.—The Coromandel Q. (*C. textilis*) is a very pretty little bird, rather smaller than the Common Quail.—The Chinese Q. (*C. excalfactoria*), a very beautiful little species, only about 4 inches long, is abundant in China, and is there kept for fighting, the males being very pugnacious, like those of other polygamous birds, and much money is lost and won on the combats of these quails. It is also used for a singular purpose—the warming of the hands of its owner.

QUAKERS; the ordinary designation of the Society of Friends (q. v.). In respect of law, Quakers differ from the rest of their fellow-citizens chiefly as regards their marriages and their taking of oaths. Thus, though the English marriage acts required all marriages to take place in a consecrated church of the establishment, before the dissenters obtained a relaxation of the law, the Quakers' marriages were excepted, and marriages between two Quakers were allowed to be solemnized according to the usages of their own sect. As regards Quakers in the matter of taking oaths, it is expressly provided by several statutes, that instead of taking an oath in the usual way, they may make an affirmation instead, whether as witness in a court of justice, or as holding a civil office, the qualification for which office is the taking of an oath. The penalties of perjury, however, attach to a false affirmation in the same way as to a false oath. With regard to church-rates, it has been recently decided that Quakers stand on the same footing as other people in respect of their liability to pay church-rates, and the mode of disputing the validity of the rate.

QUAKING GRASS (*Briza*), a genus of grasses, having a loose panicle; drooping spikelets, generally remarkable for their broad and compressed form, suspended by most delicate footstalks, and tremulous in every breath of wind; the spikelets with two glumes and numerous florets, the florets having each two awnless palæ, which become incorporated with the seed. The species are few, and mostly European. They are all very beautiful. *B. maxima*, a native of the south of Europe, is often planted in flower-gardens. *B. media*, the only species common in Britain, growing in almost all kinds of poor soil, from the sea-coast to an elevation of 1,500 feet, is of some value as a pasture-grass, being very nutritious, although the quantity of herbage is scanty. The value of many poor pastures very much depends on it; but when they are enriched by manures, it generally disappears. It is sometimes sown by farmers, but not nearly to such an extent as it would be if its seed did not

lose vitality so quickly that only a small proportion

Quaking Grass (*Briza media*).

grows, if it is not sown in autumn when newly ripened.

QUAMASH, or BISCUIT ROOT (*Camassia esculenta*), a plant of the natural order *Liliaceæ*, nearly allied to squills and hyacinths. It is a North American plant, abounding on the great prairies west of the Mississippi. The roasted bulbs are agreeable and nutritious, and are much used as an article of food.

QUANTIFICATION OF THE PREDICATE, a phrase belonging to Logic, and introduced by Sir W. Hamilton to express the characteristic feature of certain logical doctrines of his respecting the Proposition and the Syllogism.

According to the Aristotelian Logic, propositions are divided, according to their *quality*, into affirmative and negative ('The sun has set,' 'The sun has *not* set'); and, according to their QUANTITY, into universal and particular ('*All* men are mortal,' '*Some* men live eighty years'). If we combine the two divisions, we obtain four kinds of propositions—Affirmative Universal ('All men are mortal'), Affirmative Particular ('Some men live to eighty'), Negative Universal ('No men are omnipotent'), Negative Particular ('Some men are not wise').

Now, it is remarked by Sir W. Hamilton, that the statement of the QUANTITY of these various propositions is left incomplete; only the *subject* of each has its quantity expressed (*all* men, *some* men, *no* men); while there is implied or understood in every case a certain quantity of the *predicate*. Thus, 'All men are mortal,' is not fully stated. The meaning is, that all men are *a part* of mortal things, there being (possibly and probably) other mortal things besides men. Let this meaning be expressed, and we have a complete proposition to this effect: '*All* men are *some* (or part of) mortals,' where quantity is assigned, not only to the subject, but also to the predicate. It might be that the predicate contained under it only the subject, as in the proposition: 'All matter gravitates.' There is no other thing in the universe except matter that obeys the law of gravitation. Knowing this, we might quantify the predicate accordingly: '*All* matter is *all* gravitating things,' a kind of proposition not recognised in the old logic. Another original form of proposition, brought out by supplying the quantity of the predicate, is, '*Some* A is *all* B;' '*Some* men are *all* Englishmen.' So that, instead of two kinds of propositions under affirmation, Sir W. Hamilton's system gives four. In the same way, he increases the number of negative propositions. 1. For 'No man is omnipotent,' he writes, quantifying the predicate, '*Any* man is not *any* omnipotent;' or, '*All* men are out of *all* omnipotent things.' 2. 'Some men are not young' is fully quantified; 'Some men are not *any* young things;' 'Some men are out of *all* young things.' These two (in their unquantified shape) are the ordinarily recognised propositions of the negative class. To them Sir W. Hamilton adds—3. '*All* men are not *some* animals,' 'All men are excluded from a certain division of the class animal;' and 4. '*Some* animals are not *some* men;' 'A portion of the animals is not included in a portion of men.'

The first result, therefore, of completing the statement of a proposition by inserting what Hamilton considers as implied in the thought—namely, the quantity of the predicate—is to give eight kinds of propositions instead of four. The next result is to modify the process called the Conversion of Propositions. See CONVERSE. The kind of conversion called *limitation* (All A is B, *some* B is A) is resolved into simple conversion, or mere transposition of premises without further change. 'All A is *some* B;' 'Some B is all A.'

The multiplication of varieties of propositions is attended with the further consequence of greatly increasing the number of *syllogisms*, or forms of deductive reasoning. See SYLLOGISM. In the scholastic logic, as usually expounded, there are nineteen such forms, distributed under four figures (four in the first, four in the second, six in the third, five in the fourth). By ringing the changes on eight sorts of propositions, instead of the old number, four, *thirty-six* valid syllogisms can be formed in the first figure. Whether the increase serves any practical object, is another question.

Sir W. Hamilton also considers that he has been led, by the new system, to a simplification of the fundamental laws of the syllogism, or, as he expresses it, 'the reduction of all the *General Laws of Categorical Syllogisms* to a *Single Canon*.'

Professor De Morgan, in his elaborate system of *Formal Logic*, has also invented and carried out into great detail a plan of expressing the quantity of the predicate; but he does not admit the whole of Hamilton's eight propositional forms, rejecting in particular the last mentioned in the above enumeration. He also increases the number of valid syllogisms as compared with the old logic. Not content with indicating that the predicate has quantity as well as the subject, he supposes the possibility of a *numerical estimate* of quantity in both terms of the proposition, and from this draws a new set of inferences. Thus, if 60 per cent. of B are included in C, and 70 per cent. in A, 30 per cent. at least of B must be found both in A and in C.—See Sir W. Hamilton's *Discussions;* Spencer Baynes's *New Analytic of Logical Forms;* De Morgan's *Formal Logic;* Mill's *Logic*, under the Syllogism; and his *Examination of Sir W. Hamilton's Philosophy.*

QUAQUAVE'RSAL (Lat. turning every way), a term applied in Geology to the dip of the Stratified rocks when arranged in dome-shaped elevations, or basin-shaped depressions, whereby the beds have an inclination on all sides to one point, that point being the summit of the dome in the one case, and the lowest level of the basin in the other.

QUA'RANTINE (from the Fr. *quarantaine*, a period of 40 days) is a forced abstinence from communication with the shore, which ships are compelled to undergo when they are last from some port or country where certain diseases held to be infectious, as yellow fever, plague, or cholera, are or have been raging. Where a quarantine is established, it is a high misdemeanour for any person in the suspected ship to come on shore, or for any one to disembark any merchandise or goods from her. The countries on the eastern and southern shores of the Mediterranean are those most commonly held to be infectious, and, as a regular arrangement, ships from them have to pass quarantine at Malta, or some French, Italian, or Spanish port. In England, the quarantine laws were, until about 20 years ago, enforced with severity; but now a quarantine is an unusual occurrence, although the power to enact it rests with the crown, and it is occasionally imposed by an order in Council. In Mediterranean ports, quarantine ordinarily lasts from 6 to 15 days, though it sometimes extends to a much longer period, during which the passengers are imprisoned in a sort of barrack called a 'lazaretto,' and the contents of the ship—animals, goods, and letters—are fumigated, punctured, sometimes immersed in water, or even acid, and all possible means are adopted to destroy infection.

Quarantine is not of necessity limited to a sea-frontier; and it is enforced—often with absurd rigour—at the frontiers between contiguous states, especially in Eastern Europe, to the annoyance of travellers, and to the serious detriment of commerce.

History declares quarantine regulations for maritime intercourse to have been first established by the Venetians in 1127 A. D.; but the practice must have been greatly older on land-frontiers; and the precautions of the Jews against leprosy indicate that a species of quarantine was enforced by them. The law for regulating quarantine, when imposed in England, is 6 Geo. IV. c. 78.

QUA'RÉ I'MPEDIT is the title of an English action, whereby a person who has purchased an advowson, or right of presentation to an ecclesiastical benefice, sues any one who disturbs or hinders him in the exercise of his legal right.

QUA'RREL, or **QUARRY**, a pane of glass of a lozenge or diamond shape. The name is also applied to a perforation or window of this form, and to square or diamond-shaped paving-stones or tiles.

QUA'RRY (Fr. *carrière*). When any useful rock is worked in an open manner at the surface of the earth, the excavation is called a quarry. Quarrying differs little from mining in principle, except that the latter is essentially an underground operation.

From a very remote period, famous granite quarries have been worked at Syene, and others of sandstone and limestone, along the banks of the Nile, for the temples and monuments of ancient Egypt. Greece found the materials for her white marble temples in the quarries of Mount Pentelicus, near Athens, and in those of the islands of the Archipelago. It was from the quarries of Travertine (a kind of limestone), at Tibur, that ancient Rome was chiefly built. Italy has long been celebrated for her marble quarries, those of Tuscany yielding the most esteemed kinds. The fine saccharoid marbles for statuary and other fine-art purposes, are exclusively obtained from the Apuan Alps, which rise around Carrara, Massa, and Seravezza. Those of Carrara, especially, are highly prized all over the world. From the quarries at Seravezza, marble to the value of £150,000 has been recently taken for the splendid cathedral of St Isaac at St Petersburg alone.

Of the more celebrated quarries of the British Islands, we may mention those of Cornwall, Aberdeen, and Wicklow for granite; those in the neighbourhood of Edinburgh, Glasgow, and Newcastle, for sandstone; those near Bristol and Doncaster, and in the Isle of Portland, for limestone; those of Derbyshire, Devonshire, Kilkenny and Galway, for marbles; and those of North Wales and Argyleshire for slates.

To understand the operations of the quarryman, it is necessary to bear in mind that all rocks belong to one or other of two great classes, namely, the stratified and the unstratified. The former are sedimentary rocks, occurring in parallel beds or strata, and consist chiefly, in so far as we are at present concerned, of sandstone and limestone. Unstratified or igneous rocks, which include greenstone or whinstone, granite, porphyry, &c., have no distinct bedding, that is, they do not lie in separate layers. Roofing slate is a stratified rock, but it splits into thinner lamina in the direction of its *cleavage* than in the direction of its bedding, the former being often at right angles to the latter. Granite and other igneous rocks have also a natural jointage or cleavage, although they are not stratified. Advantage is taken of these peculiarities in quarrying the different rocks, but in the main the systems adopted do not greatly differ.

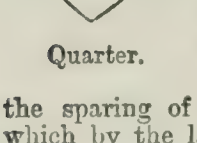
Stones are most frequently separated from their native rock by blasting with gunpowder. This operation is described in detail under BLASTING; see also GALVANISM and SAFETY-FUSE. Of late the practice of boring jumper-holes with engine power has been introduced, and wherever it can be conveniently applied, must be a great improvement on the slow and tedious process of boring by hand. See TUNNEL.

With some stratified rocks, such as sandstone, a good many of the best stones are procured without the aid of gunpowder. Hand-tools are alone used, because blasting is apt to cause rents, and otherwise shatter portions which it is desirable to keep solid. By this method, the quarryman makes a number of small holes with a pick, along a certain length of rock, into which steel wedges are inserted. After a succession of blows with heavy hammers, the wedges at length cut through the stratum. Blocks for columns, obelisks, tombstones, &c., are best procured in this way. It may also be stated that these are obtained from those more valuable parts of sandstone deposits technically termed 'liver rock,' which consist of the thicker and more consolidated strata. Flagstones and other pieces of limited thickness are quarried from the thinner beds termed 'bed rock.'

When stones are removed in masses by blasting or otherwise, they have still to be quarried into shape, according to the purpose for which the various pieces are best suited. Thus, in an ordinary building-stone quarry, the larger stones (after those of unusual size and quality are selected for the purposes named above) are roughly formed into ashlar, window-sills, lintels, rybats, corners, steps, and the like, by means of such tools as picks, hammers of various kinds, and wedges. The small irregular-shaped pieces are called *rubble*, and are used for the commonest kind of building. Slates are split up into the thickness used for roofing, by means of a mallet and broad chisel. In granite quarries worked for paving-stones, as has been incidentally alluded to above, the loss of material in reducing the blocks to the size and shape required, is enormous, as much as four-fifths of the whole being commonly wasted. Besides the tools already mentioned, long iron bars called *pinches*, and powerful cranes for turning and lifting the larger stones,

are nearly all the implements required by the quarry-master.

In quarrying, as well as in mining, much of the cost is incurred for the pumping of water from the workings. A good steam-engine and set of pumps are therefore indispensable for every quarry of any extent. Much expense is also every now and then incurred in clearing away sand, gravel, and other loose débris from the upper bed of the rock. This, which is called 'drift' by geologists, and 'tirring' in some localities by quarrymen, often becomes suddenly very deep, especially where the beds dip at a high angle, and is an obstacle by which many quarries of stratified rock are sooner or later arrested.



QUARRIES, in point of law, belong to the person who is owner of the freehold or inheritance of the land, the maxim being, that the owner is entitled to the soil down to the centre of the earth. No person, therefore, is entitled to work a quarry or carry away the materials unless he derives his right from the owner by lease or other legal title, for the stones or materials are part of the soil, and belong to the freeholder.

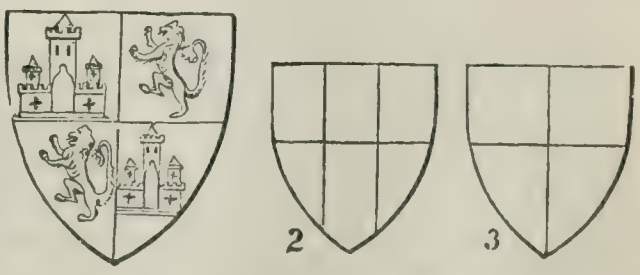
QUART, a measure of capacity, and the fourth part of a Gallon (q. v.). The word is nothing more than the common word 'quarter,' a fourth part. The ordinary *quart-bottle* is a deception, containing only the sixth part of a gallon, and often less.

QUARTAN FEVER. See AGUE.

QUARTER, the name of two measures in use throughout the United Kingdom, one of them a measure of weight, and the other of capacity. The former is denominated a quarter from its being the fourth part of a hundredweight, and contains 28 lbs. avoirdupois; the capacity measure of the same name is said by some to have been so called from its being the fourth part of a 'chaldron,' but, as it happens, the quarter does not always bear this relation to the chaldron. As the porphyry coffer in the King's Chamber of the Great Pyramid (see PYRAMID) is said to be almost accurately the quadruple of the English quarter, the bold theory has been advanced that this is the origin of the measure and the name (see *Our Inheritance in the Great Pyramid*, by Piazzi Smyth). The quarter contains 8 bushels, of 4 pecks each. See BUSHEL.

QUARTER, in Heraldry, a subordinary consisting of the upper dexter fourth part of the shield, cut off by a vertical and a horizontal line meeting in the centre of the shield. When two or more coats are marshalled together on a shield divided into squares for their reception, such divisions are also called quarters. See QUARTERING.

Quarter.



QUARTER, in War, signifies the sparing of the life of a vanquished enemy, which by the laws of war is forfeit to the victor. The expression seems to be derived from the use of the word 'quarter' to designate the lodging of the particular warrior; to *give quarter* to a prisoner being to send him to his captor's quarter for liberation, ransom, or slavery. The refusal of quarter is a terrible aggravation of the horrors of war, and is only at all justifiable towards an enemy who has been guilty of atrocious cruelty himself or of some flagrant breach of faith.

On shipboard, a quarter is the stern portion of each of the ship's sides. The extent of the quarter is arbitrary, but it is generally held to comprise about one-fifth of the ship's length.

QUARTER-DAYS are the days adopted between landlord and tenant for entering or quitting lands or houses and for paying rent. The origin of these periods is no doubt due entirely to convenience, and though in England they are unknown to the common law, yet now they are almost part and parcel of every agreement made between parties as to the letting of houses and land. In England, if nothing is said as to the time of payment of rent, it is due only once a year, and the first payment is due at the end of a year from the time of entry. But, owing to the convenience of the usual quarter-days, they are commonly referred to, and thereby imported into the contract. Thus, it is usual to enter and leave houses either at one of the four ordinary quarter-days, or where it is so arranged at half-quarter-days, and these points of time are fixed upon for the convenience of calculating rent. Rent of houses is generally made payable quarterly on the usual quarter-days. These are, in England and Ireland, Lady Day, March 25; Midsummer Day, June 24; Michaelmas Day, September 29; and Christmas Day, December 25. In Scotland, there are what are called two legal terms in each year, and two conventional terms, the latter being only adopted when expressly so agreed. The legal terms are Whitsunday, May 15, and Martinmas, November 11; and the conventional terms are Candlemas, February 2, and Lammas, August 1. The law of Scotland differs from that of England in this, that if nothing is said between the parties on letting houses and lands, these legal terms are impliedly included as part of the agreement, both as regards time of entry and payment of rent. Thus, as to houses and grass-lands, the legal term of entry is Whitsunday, and that of entry to arable land is Martinmas. So the rent is presumed to be payable twice a year at those legal terms, if nothing is said to the contrary.

QUARTER-DECK of a ship is an upper deck extending from the main-mast to the poop, or, when there is no poop, from the main-mast to the stern. It is used as a promenade by the officers only, and, in a ship-of-war, no person—officer or otherwise—enters upon it without touching his hat in token of salute. When the captain addresses his men, or confers public distinction on any individual, the crew are summoned aft on the quarter-deck.

QUARTERING, in Heraldry, is the bearing of two or more coats on a shield divided by horizontal and perpendicular lines, a practice not to be found in the earlier heraldry, and little in use till the 15th century. Arms may be quartered for various reasons. 1. To indicate dominion. A sovereign quarters the ensigns of his different states. The earliest instance of quartering in England is found in the paternal arms of Eleanor, daughter of Frederick III., king of Castile and Leon, and first wife of Edward I., as represented on her tomb in

Quartering.

Westminster Abbey—the castle of Castile occupying the first and fourth quarters, and the lion of Leon the second and third. The arms of England and

Ponthieu are similarly quartered on the same monument, and on the crosses erected to Queen Eleanor's memory. The received rule regarding the quartering of the ensigns of different states is, that precedence is given to the most ancient, unless it be inferior in importance. Feudal arms are sometimes quartered in the same way by subjects. 2. Arms of augmentation or special concession accorded to a subject by his sovereign, by way of honour, are sometimes granted to be borne quarterly with the paternal arms. These generally contain a portion of the royal insignia, and have precedence of the paternal coat. 3. The most usual reason for quartering is to indicate descent from an heiress who has intermarried into the family. Where there is but one heiress, her coat occupies the second and third quarter of the shield, and the paternal arms the first and fourth. Where there are more than one, they are marshalled in the successive quarters in the order of the intermarriages. Where more than four coats have to be marshalled, the number of vertical lines is increased, and the divisions, though more than four, are still called quarters. Where there is an odd number of coats, the last quarter is usually filled up by repeating the first. One of the quarters may itself be quartered, when the heiress was entitled to bear a quartered coat; the shield is then said to be counter-quartered, and its primary quarters are called *grand quarters*. Quarterings are not allowed to be added to the paternal coat without the sanction of the heraldic authorities.

The expression 'quarterings' is often loosely used for *descents* in cases where there is no right to quarter from representation. The eight or sixteen quarterings which are sometimes ranged round the Scottish funeral escutcheon, and which are still important for many purposes in Germany, have no reference to representation, but imply purity of blood for four or five generations; i. e., that the father and mother, the two grandmothers, and four great-grandmothers, as also in the case of sixteen quarterings, the eight great-great-grandmothers, have all been entitled to coat-armour.

QUA'RTERMASTER. In the British Army, the *quartermaster-general* is a staff-officer of high rank, whose duty it is to arrange the marches, quarters, and internal arrangements of the army to which he belongs. Every army has some officer of this department; from a brigade with a deputy-assistant-quartermaster-general, receiving £173, 7*s*. 6*d*. a year, besides regimental pay, up to a complete army under a commander-in-chief, with a quartermaster-general, who is usually a general officer, and receives £691, 19*s*. 7*d*. per annum, besides his other pay. At headquarters, there is a permanent quartermaster-general, responsible for all the movements of the army, the organisation of expeditions, camps of instruction, &c.

The *quartermaster* is an officer on the staff of each regiment, in which he holds the relative rank of lieutenant. His duties are to superintend, assign to their respective occupants, and have charge of, quarters, barracks, tents, &c. used by the regiment. He is also regimental storekeeper. He rises, with scarcely an exception, from the ranks, the experience of an old sergeant being considered highly useful in the office. The quartermaster has no further promotion to look forward to; but after 30 years' service in all—including 10 as an officer—he may retire with the honorary rank of captain. The *quartermaster-sergeant* is a non-commissioned officer appointed to assist the quartermaster in his various duties.

In the Navy, the *quartermasters* are certain petty officers appointed in each ship by the captain to have charge of the stowage of ballast and provisions, of coiling ropes, attending to the steering, keeping time by the sand glasses, &c.

The Quartermaster Department of the Army of the United States provides the quarters and transportation of the army; storage and transportation for all army supplies; army clothing; camp and garrison equipage; cavalry and artillery horses; fuel; forage; straw materials for bedding and stationery. The incidental expenses of the army are paid through the Q. M. Department, and include per diem and extra-duty men; postage on public service; expenses of courts martial pursuit and apprehension of deserters, burial of officers and soldiers; expenses of hired escorts, interpreters, spies, and guides, of veterinary surgeons, supply of water at posts, and generally the proper and authorized expenses for the movements and operations of the army not expressly assigned to any other department. The Q. M. Department includes 85 commissioned officers, viz., 1 brigadier-general, 6 colonels, 10 lieutenant-colonels, 15 majors, 37 captains, and 16 military storekeepers.

QUARTERS, in Naval and Military affairs, are, generally, the positions assigned to persons or bodies of men. In a more special sense, the quarters in the army are the places of lodging assigned to officers or men when not actually on duty. *Headquarters* is the quarter of the commanding officer of a force, or of a section of a force. The headquarters of the whole British army is at the Horse Guards, where the commander-in-chief has his permanent offices.

In the *Navy*, quarters has the special meaning of the positions to be taken by every man in actual combat.

QUARTERS, the upright posts of timber-partitions, &c., used for lathing upon. They are generally about 4 or 4½ inches by 3 inches, and are placed from 12 to 14 inches or farther apart. In America they are termed studding.

QUARTER SESSIONS, in England, is a court or meeting of justices of the peace, who assemble every quarter of the year, for judicial as well as miscellaneous business. The meetings are fixed by statute to be held in the first full week after December 28, March 31, June 24, and October 11, respectively; often otherwise called the Epiphany, Easter, Trinity, and Michaelmas Sessions. The chief officer of the Court of Quarter Sessions is the *custos rotulorum*, so called because he is intrusted with the custody of the records and rolls. He is always one of the justices of the peace of the county or riding, nominated by the crown, and appointed by the commission. His deputy is the clerk of the peace, who acts also as clerk to the Court of Quarter Sessions. The jurisdiction of the Court of Quarter Sessions is confined to criminal business, and is very important. It includes all criminal offences whatever, except the highest classes; thus, it has no jurisdiction to try for treason, murder, or capital felony, or blasphemy, perjury, forgery, arson, bigamy, abduction of women or girls, concealment of birth, offences against the Queen's title or the bankrupt laws, bribery, blasphemous, seditious, or defamatory libels, unlawful combinations or conspiracies, stealing or destroying wills or records. Besides its jurisdiction in criminal offences, there are numerous miscellaneous matters of which the Court has cognizance, including appeals from petty sessions, and from justices in special sessions, on a great variety of subjects, as to convictions of vagrants, stopping up highways, removal of paupers, &c. The justices who do the work of Quarter Sessions are all unpaid, and thus save the country much expense. They generally choose a chairman of their own body to preside regularly at these courts, which office is considered a great honour,

and is generally given to an able practical man, well versed in business.

This plan, however, of unpaid judges has been found inexpedient in boroughs and large towns, where the justices of the peace, being appointed chiefly from successful tradesmen, are not possessed of the necessary education to secure the efficient performance of like duties. There is therefore appointed for every borough in England a Recorder, who is a barrister, appointed by the Home Secretary, and is paid by salary out of the borough fund—a salary, however, very trifling in amount. His duty is confined to trying prisoners and other judicial business, and he is in fact, in his own person, the Court of Quarter Sessions for boroughs. There is also an exception to unpaid judges of Quarter Sessions in the county of Middlesex, where a barrister is appointed to act in the trial of prisoners, and called the assistant judge, being the official chairman of the Middlesex Sessions. The routine of business at Quarter Sessions consists of the trial of offenders, the trial of appeals, and the hearing of motions upon different subjects. Sometimes a second court sits, consisting of some of the justices appointed by the whole court, whenever the business is unusually heavy. In Scotland, there is also a Court of Quarter Sessions of the peace, held four times a year at the county town—viz., on the first Tuesdays in May, August, and March, and the last Tuesday in October. At these courts, the justices have power to review the sentences of special and petty sessions. But these courts are of a trifling description compared to the courts of the same name in England. In Scotland, the judicial business which in England devolves on Courts of Quarter Sessions, is chiefly disposed of by the sheriff of the county.

QUARTER-STAFF, formerly a favourite weapon with the English for hand-to-hand encounters, was a stout pole of heavy wood, about 6½ feet long, shod with iron at both ends. It was grasped in the middle by one hand, and the attack was made by giving it a rapid circular motion, which brought the loaded ends on the adversary at unexpected points.

QUA'RTETT, a piece of music arranged for four voices or instruments, in which all the parts are *obligati*, i. e., no one can be omitted without injuring the proper effect of the composition. Vocal quartetts are generally accompanied by instruments to sustain the voices. A mere interchange of melody, by which the parts become in turn principal and subordinate, without any interweaving of them, does not constitute a quartett. Quartetts for stringed instruments are generally arranged for two violins, a tenor violin, and violoncello. The most important quartetts have been composed by Haydn, Mozart, Beethoven, Spohr, and Onslow.

QUA'RTILE. See ASPECTS.

QUA'RTO-DE'CIMANS, those who, after the final decision of the Council of Nicæa, continued to hold that it was obligatory on Christians to celebrate Easter on the 14th day of the first lunar month near the vernal equinox, *whether that 14th day fell on Sunday or not*, or who, even before the Council of Nicæa, held the observance of the Jewish Passover to be of obligation. The controversies as to the celebration of Easter have been briefly described under the head EASTER (q. v.).

QUARTZ, a mineral, which is essentially *Silicic Acid*, or *Oxide of Silicon* (see SILICON), although it is often combined or mixed with other substances. It is a very abundant and widely-diffused mineral. It is almost the sole constituent of quartz rock, in which gold is far more frequently found than in any other matrix; and it is a principal constituent of granite, syenite, protogine, eurite, pegmatite, granulite, elvanite, all the different kinds of sandstone, and many other rocks. It is also a common mineral in trap-rocks, limestone, &c., and the sands of the sea-shore and of deserts are chiefly formed of it. It is found both massive and crystallised; the primary form of the crystals is a rhomboid, but it far more frequently occurs in six-sided prisms, terminated by six-sided pyramids; or in six-sided pyramids; or sometimes in dodecahedrons, formed by six-sided pyramids base to base. It is hard enough to scratch glass easily, and it gives fire with steel. It becomes positively electrical by friction; and two pieces, rubbed together, give light in the dark. When pure, it is quite colourless; but, owing to the presence of foreign substances, it often exhibits great variety of colours; and many minerals, known by different names, and consisting chiefly of quartz, have little or nothing to distinguish them but their colour. Thus Rock Crystal, Chalcedony, Carnelian, Cairngorm, Agate, Amethyst, Prase, Chrysoprase, Jasper, &c., are mere varieties of quartz. Opal (q. v.) is very nearly allied to it.

Quartz Rock, or Quartzite, is a sedimentary sandstone, converted into a very hard, compact rock by metamorphic action. It is distinctly granular; the grains, however, seem to melt into each other, or to be enveloped in a homogeneous silicious paste. It is frequently brittle, and in weathering, it breaks up into small irregular cubes.

Quartz Veins occur in metamorphic rocks. The structure of the veins is compact and homogeneous, and very different from that of quartzite. Veins not only differ in width, but the same vein is very variable throughout its course, sometimes thinning to a very fine film, and then swelling out to great thicknesses. Quartz veins are more metalliferous than the mass of the rocks in which they occur. They are the principal natural repositories of gold, for though the precious metal is chiefly obtained from alluvial sands and gravels, these are the weathered and abraded fragments of the under-lying, or neighbouring Palæozoic rocks. Small quantities of gold have been found in the quartz veins traversing the Silurian and Cambrian rocks of Wales and Scotland; and in Victoria, the great veins are so highly auriferous, that they are mined for the precious metal. Wherever the Lower Silurian rocks make their appearance on the surface throughout the colony, they are everywhere intersected by enormous numbers of quartz veins, which often reach a thickness of 10 to 15 feet. As yet, only a very small proportion of these have been explored; but the results have been so remunerative, that mining in the solid rock for gold is extensively pursued. One mine has been driven to a depth of 400 feet, and, contrary to the generally-received opinion, the vein at this depth continued to be auriferous.

QUASIMODO SUNDAY, called also DOMINICA IN ALBIS, the first Sunday after Easter. The name Q. S. is taken from the first words of the Introit (1 Peter, ii. 2) of the mass of the day. The name *Dominica in Albis* is derived from the custom which was formerly observed of the neophytes who had been baptised at Easter appearing in white garments in the church.

QUASS, a sort of weak beer produced in Russia by fermenting rye-meal in warm water. It is usually bottled in stone bottles, and is a favourite beverage with the people generally. When it becomes too sour, it is used as vinegar.

QUA'SSIA, a genus of trees and shrubs of the natural order *Simarubaceæ* (q. v.); having hermaphrodite flowers, with five petals combined into a

tube, and much longer than the small calyx, ten stamens, five germens, and only one style; the fruit composed of five drupes. *Q. amara* is a native of the tropical parts of America, and of some of the West India Islands. It is a shrub of 10–15 feet high, with racemes of bright-red flowers, and large pinnate leaves, the stalks of which are remarkably winged and jointed. The wood, and particularly that of the root, has a very strong bitter taste, and was at one time much used in medicine under the names of *Q.-wood*, *Bitterwood*, &c. The flowers were valued in Surinam for their stomachic properties, as early as the beginning of the 18th c.; the wood of the root began to be known in Europe before the middle of that century, and was more fully brought into notice about 1756, by Rolander, a Swede, who had visited Surinam, and had learned its value from a negro, called Quassi, or Quasha. This negro had employed it with great success as a remedy for fevers, and although, as Rolander says, a very simple man, had acquired a great reputation by his use of it. Linnæus published a dissertation on it in 1763, and it was he who gave to the genus the name Quassia, from the name of the slave by whom its medicinal qualities had been made known. The true Q. is now, however, little used; its name having been transferred to the Bitterwood (q. v.) of the West Indies, *Picræna* (or *Simaruba*) *excelsa*, a lofty tree, the wood of which possesses the same properties, although in an inferior degree; but this inferiority is compensated by the greater facility with which any requisite supply is obtained. It is the wood of this tree which is now sold as *Q.-wood*, or *Q.-chips*, in the shops. It is used to a considerable extent instead of hops for making beer, although the use of it is illegal in Britain, and beer made with it is said to become muddy and flat, and not to keep. Q.-wood is narcotic, and a decoction of it is used for killing flies. Cabinet-work made of it is safe from all attacks of insects. In medicine, it is a valuable tonic; but in fevers, it is not to be compared with Peruvian bark and its alkaloids. Its properties depend chiefly on a bitter principle, called *Quassite* or *Quassin*.

QUATE'RNARY, a term employed by some French and English geologists to characterise the Post-tertiary strata, which they group together into an epoch of equal value with the three great divisions of Primary, Secondary, and Tertiary. The deposits included under the name will be found described under the Pleistocene and Recent strata, to which we refer the reader.

QUATE'RNIONS, the name given by its inventor, Sir W. R. Hamilton (q. v.), to one of the most remarkable of the mathematical methods or calculi, which have so enormously extended the range of analysis, while simplifying its application to the most formidable problems in geometry and physics.

It would be inconsistent with our plan to give even a complete though elementary analytical view of this calculus; but it is possible, by means of elementary geometry and algebra alone, to give the reader a notion of its nature and value.

For this purpose, it will be necessary to consider some very simple, but important, ideas with reference to the *relative position* of points in space. Suppose A and B to be any two stations, one, for instance, at the top of a mountain, the other at the bottom of a coal-pit. *Upon how many distinct numbers does their relative position depend?* This can be easily answered thus: B is so many degrees of longitude to the east or west of A, so many degrees of latitude to the north or south of A, and so many feet above or below the level of A. THREE numbers suffice, according to this mode of viewing the question, to determine the position of B when that of A is given. Looking at it from another point of view, suppose A to be the earth, B a fixed star. To point a telescope at B, we require to know its altitude and azimuth, its latitude and longitude, or its right ascension and declination. Any of these pairs of numbers will give us the *direction* of the line AB, but to determine absolutely the position of B, we require a *third* number—viz., the length of AB. Hence, it appears that any given line AB, of definite length and direction, is completely determined by *three* numbers. Also, if the line CD be parallel and equal to AB, it evidently depends on the same three numbers. Hence, if we take the expression (AB) to denote (*not* as in geometry, the length of AB merely, but) the length and direction of AB; we see that there will be no error introduced, if we use it in the following sense:

$$A + (AB) = B;$$

i.e., if, beginning with A, we take the step represented by (AB), we shall find ourselves at B. From this it follows at once that, if C be any third point,

$$A + (AB) + (BC) = C;$$

i.e., beginning at A, and taking the successive steps (AB) and (BC), we are finally brought to C. But we have also

$$A + (AC) = C,$$

by taking the step from A to C at once. Hence, with the present signification of (AB) &c., we see that

$$(AB) + (BC) = (AC),$$

which shews that lines, *when their length and direction are both considered*, are to be added or compounded according to the same law as velocities or forces. See COMPOSITION OF FORCES. In this sense, a line is called by Sir W. R. Hamilton a *Vector*.

Again, we have evidently

$$A + (AB) + (BC) + (CA) = A,$$

because the three successive steps bring us back to the starting-point. Hence

$$(AB) + (BC) = -(CA),$$

and therefore $(AC) = -(CA)$, or the sign (only) of a vector is changed if its direction be reversed.

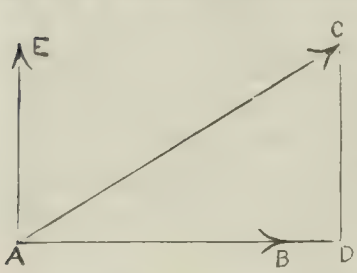
The rules for the addition, and therefore for the subtraction, of vectors are thus extremely simple; and, without any further preface, we are in a position to solve a great many geometrical problems, some of which are of no common difficulty. A comparatively simple one must suffice; let us prove Euclid I., 33; i.e., if AB be parallel and equal to CD, AC is parallel and equal to BD. In vectors, given $(AB) = (CD)$, prove $(AC) = (BD)$. We have at once, by going directly from A to C, and then by the course A, B, D, C

$$(AC) = (AB) + (BD) + (DC).$$

But $(AB) = (CD) = -(DC)$ by what we have just proved. Hence the first and third terms of the expression for (AC) are equal and of opposite signs, and therefore

$$(AC) = (BD).$$

This example has been chosen from its simplicity, and gives an extremely inadequate idea of the grasp which vectors take in common geometry.



So far, we have not advanced much beyond common geometrical methods; but we *now* come to the step in which quaternions proper are introduced, a vector being merely a degraded species of

quaternion. This new step contains Hamilton's answer to the question, answered over and over again during the last fifty years in forms of the most uncouth complexity, '*How to express the product, or the quotient, of two vectors, or directed lines.*' In other words, keeping to one part of the question only, what is the nature of the factor q in the equation

$$(AC) = q(AB),$$

where A, B, C are any three points?

Let us first consider *on how many independent numbers does it depend?* It might at first sight appear to depend on *six*, for (AB) and (AC), as we have already seen, each contain *three*. But let us analyse the process of passing from the one vector to the other, much as we have already analysed the vector step of passing from one point to another. To simplify the idea of the process, let us suppose it to be effected by a species of rotation. First, then, in order that (AB) may be turned so as to coincide in *direction* with (AC), it must be turned about an axis perpendicular to the plane of the triangle ABC, and through an angle BAC. Now, the *direction* of a line depends on *two* numbers, as we have seen above; hence we have *two* for the direction of the axis, and *one* for the angle through which AB is turned. But AB and AC are not, in general, of equal length; hence, after their directions have by turning been made coincident, AB must be compressed or stretched till its *length* is the same as that of AC. Thus, a *fourth* number is required for the complete description of the process, and therefore q depends upon *four independent numerical quantities;* hence its name, quaternion. A similar investigation, but somewhat less elementary, shews that the *product* of two vectors also depends on four distinct numbers. This will be proved analytically further on in the article.

Now, suppose AB and AC to be *equal* to each other, and at right angles; and suppose

$$q(AB) = (AC);$$

i. e., suppose that q turns AB through a right angle in a given plane, without altering its length. Apply the operation, denoted by q, a second time, and we have

$$q \,.\, q \,.\, (AB) = q(AC).$$

Now $q(AC)$ must represent a vector equal to AC in length, but turned through a right angle, in the plane BAC. It must therefore be in the direction of BA produced through A, and equal in length to AB. Hence, by a previous remark, it may be expressed by

$$-(AB), \text{ or by } (BA).$$

Hence, $q \,.\, q(AB) = -(AB)$, or $q \,.\, q = -1$.

The particular quaternion, therefore, which turns a vector through 90° without altering its length, has its square equal to -1. Though, of course, they are essentially a real geometrical conception, this result shews how closely quaternions are connected with what are called Imaginary Quantities (q. v.) in analytical geometry and algebra.

Now, it is found, by a careful examination of all the consequences involved, that we are at liberty to represent by a vector of unit length, perpendicular to the plane of two equal lines at right angles to each other, the quaternion which, employed as a multiplier, changes one of these lines into the other. This result we must assume; as its proof, though not in any sense difficult, would require the free use of analytical symbols to condense it within our assigned limits. Hence, three vectors, each of unit length, and each perpendicular to the other two, have the property that the product of any two, taken in the proper order, is the third. For illustration, suppose these to be drawn eastwards, northwards, and upwards, and let them be represented (according to Hamilton's notation) by i, j, k respectively; we have the following equations among them:

$$i \,.\, j = k, \quad j \,.\, k = i, \quad k \,.\, i = j;$$

where it is to be observed that the *order* of the alphabet is maintained throughout. Also, as before, we see that $i^2 = j^2 = k^2 = -1$.

Considering them, for a moment, as handles to be laid hold of to turn the whole system about one of them, we see that i turns j into the position of k; that is, the operation i may be effected by a left-handed quadrantal rotation about the eastward line i. What, then, is the result, upon the vector i, of the rotation symbolised by j? Laying hold of the northward line j, use it as an axis of left-handed quadrantal rotation, and the effect on the system will be not only (as above, $jk = i$) to make the upward line an eastward one, but to make the eastward line a *downward* one; in symbols,

$$j \,.\, i = -k.$$

Comparing this with

$$i \,.\, j = k,$$

we see that in quaternions, *the Commutative Law of Multiplication does not hold;* i. e., that the product depends not only on the factors, as in arithmetic and algebra, but upon the *order* in which the multiplication is effected. This is, of course, a little perplexing to the beginner, but is easily got over; and the mere consideration of this fact is often sufficient for the proof of theorems regarded in general as of no ordinary difficulty.

For further information, we must refer the reader to Sir W. R. Hamilton's *Lectures on Quaternions*, and his *Elements of Quaternions* (1866). Some elementary information may also be derived from papers by Kelland and Tait in the *Quarterly Messenger of Mathematics*, and the *Quarterly Mathematical Journal*. The subject is yet in its infancy, but even now its power is herculean; and its extreme simplicity and generality recommend it to all who are desirous of extending the effective range of mathematical analysis.

QUA'TRAIN (Fr. *quatre*, four) is the name given (originally by the French) to a little poem of four verses (lines) rhyming alternately, or even sometimes to four verses of a longer poem, such as a sonnet, if they form a complete idea within themselves. Epigrams, epitaphs, proverbs, &c., are often expressed in quatrains.

QUATRE-BRAS (Four Arms), a village of Belgium, province of South Brabant, about ten miles south-south-east of Waterloo. It is situated at the intersection of the great roads from Brussels to Charleroi, and from Nivelles to Namur, whence its name. On the 16th of June 1815—two days before the battle of Waterloo, Q. was the scene of a desperate and sanguinary battle between the English under Wellington and the French under Ney. The honours of the field remained with the former; but the severe defeat of Blücher the same day at Ligny, rendered Wellington's hard-won victory almost

valueless; and foreseeing that it would be impossible for him to maintain his position, the English commander retired next morning through Jemmapes to Waterloo, in order to keep up his communication with the Prussian army. The loss of the English and their allies at Q. was in all 5200; that of the French, though beaten, amounted only to 4140. This is to be accounted for by the fact that, during the greater part of the engagement, the English had no cavalry (for the Belgian horse galloped off the field without striking a blow) and no artillery.

Quatrefoil.

QUATREFOIL, an opening in tracery, a panel, &c., divided by cusps or featherings into four leaves. This form is much used as an ornament in Gothic architecture.

QUATREFOIL, a heraldic bearing meant to represent a flower with four leaves. It is not represented with a stalk unless blazoned as *slipped*, in which case the stalk joins the lower leaf.

Quatrefoil.

QUATREMÈRE, Etienne Marc, a learned French orientalist, was born in Paris 12th July 1782, and from his earliest childhood to his latest years, was literally immersed in abstruse studies, and lived more after the fashion of a medieval recluse than a modern scholar. His public life was almost eventless. Employed in 1807 in the manuscript department of the *Bibliothèque Impériale*, he was promoted in 1809 to the Greek Chair in the College of Rouen, and in 1819 to the chair of Ancient Oriental Languages in the Collége de France. In 1827 he became Professor of Persian in the School for Modern Oriental Languages. He died 18th September 1857. Q.'s erudition was something enormous, as might have been expected from his uninterrupted life-long devotion to study, but according to M. Ernest Renan (himself one of the first living orientalists), he was strikingly deficient in critical insight, and a genius for sagacious and luminous generalisation. He would never believe in the hieroglyphic discoveries of Champollion; he despised comparative philology, and thought the labours of men like F. Schlegel, Bopp, Burnouf, &c. were wasted. But in less delicate fields of exploration he is safe. His historical and geographical memoirs, for example, are of incalculable value. Q.'s principal works are—*Recherches sur la Langue et la Littérature de l'Egypte* (Par. 1808), in which it is shewn, in the clearest manner, that the language of ancient Egypt is to be sought for in the modern Coptic; *Mémoires Géographiques et Historiques sur l'Egypte* (Par. 1810); *Histoire des Sultans Mamelouks* (Par. 1837), from the Arabic of Makrizi; *Histoire des Mongols de la Perse* (Par. 1836), from the Persian of Rashid-Eddin; and his edition of the Arabic text of the Prolegomena of Ibn-Khaldun, one of the most curious monuments of Arabic literature. Besides these, a multitude of most valuable articles are scattered through the pages of the *Journal Asiatique* and the *Journal des Savants*. It is deeply to be regretted that circumstances interfered to prevent his executing certain great lexicographical works—Arabic, Coptic, Syriac, Turkish, Persian, and Armenian dictionaries—which he had planned, and for which he had gathered ample materials. His old master, Silvestre de Sacy, pronounced him 'the only man capable of making an Arabic dictionary.'

QUA'VER, in Music, a note whose measure is equal to half a crotchet, one fourth of a minim, or one-eighth of a semibreve. It is represented thus: ♪; or when two or more are ♫, ♫; conjoined, thus: ♬.

QUAY (Fr. *quai*), an artificial landing place or wharf, consists usually of a platform or pier of masonry, surmounted with cranes, tramways, and other appliances for lading and discharging cargoes from shipping.

QUEBEC, the capital of the province of Quebec, formerly Canada East, is situated on a steep promontory at the junction of the rivers St Lawrence and St Charles, in lat. 46° 48′ N., long. 71° 12′ W. Pop. in 1871, 59,699. Q. is 180 miles north-east of Montreal, 503 miles east north-east of Toronto, and 540 miles north north-east of New York. It has numerous railway connections in America by means of the Grand Trunk Railway. The site of Q., originally occupied by an Indian village named Stadacona, was discovered by Jacques Cartier in 1535; but the city was founded by Champlain in 1608. It continued to be the centre of French trade and civilisation, as well as of Roman Catholic missions in North America, till 1759, when it fell into the hands of Britain by the memorable victory of Wolfe on the Heights of Abraham, above the city. Q. remained the chief city of Canada till the British settlements in the West were erected into a separate province, when it became the capital of Canada East. Ottawa (q. v.) was chosen as the capital of the United Canadas, and the movement, begun in June, 1864, for a federal union of all the British North American provinces, led to the erection of the Dominion of Canada, July 1, 1867. The citadel of Q. is the most impregnable fortress on the continent of America. The view which it commands is one of the most magnificent in the world, and the scenery in its neighbourhood, amid which are the Falls of Montmorenci, imparts an additional attraction to the city. A seminary for the education of Roman Catholic clergymen was established in the city in 1636 by M. de Laval de Montmorenci, and was raised by the queen in 1854 into a university bearing Laval's name. A Presbyterian college, named after its founder, Dr Morrin, was instituted in 1862, and affiliated in the following year to the M'Gill University of Montreal. Q. is the seat of a Roman Catholic archbishop and an Anglican bishop, whose respective cathedrals are among the finest specimens of Canadian church architecture. About 1500 vessels enter the port every year, and export about 33,000,000 cubic feet of timber. The exports in 1872 amounted altogether to $11,931,077; the imports to $7,532,221.

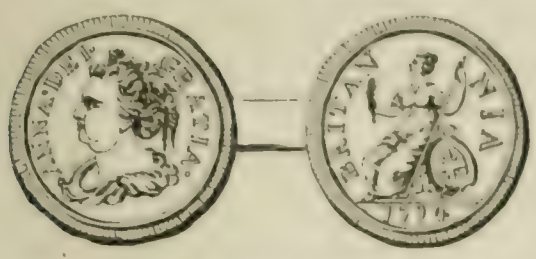
QUEBEC, formerly Lower Canada, and Canada East, a province of the Dominion of Canada, united by an act of the British Parliament, passed in March, 1867. The government is vested in a lieutenant-governor and an executive council appointed by him. It sends 24 members to the senate and 65 representatives to the Canadian Parliament. The principal cities are Quebec, the capital of the province, and Montreal (q. v.). Area 210,020 sq. miles. The population in 1871 was 1,191,516, of whom 1,019,850, or nearly 87 per cent., were Roman Catholics. For statistics of revenue and expenditures, see Canada, in Supplement, vol. X.

QUE'DLINBURG, a town of Prussian Saxony, at the northern base of the Harz Mountains, on the river Bode, and 35 miles south-west of Magdeburg. Founded by Henry the Fowler in 920, it consists of an old town, a new town, and several suburbs, and is surrounded by a wall flanked with towers. On an eminence overlooking the town stands the castle, which, prior to the Reformation, was the residence of the abbesses of Q., who were

independent princesses of the empire, and had a vote in the diet, and other privileges. This town was a favourite residence of the German emperors of the Saxon line. It is now the centre of considerable industry. Cloth is manufactured, and there is a good trade in corn and cattle. Pop. (1867), exclusive of the garrison, 16,856.

QUEEN (Sax. *cwen*, woman; Gr. *gyne*, woman; Sansc. *goni*, mother, from *gan*, to generate), in its primary signification, the king's consort, who has in all countries been invested with privileges not belonging to other married women. The English queen, unlike other wives, can make a grant to her husband, and receive one from him. She can sue and be sued alone, and purchase land without the king's concurrence. The Statute of Treasons makes it treason to compass her death, or to violate her chastity, even with her consent, and the queen consenting is herself guilty of treason. If accused of treason, the queen is tried by the peers of the realm. A duty, amounting to one-tenth of the value of fines on grants by the crown, was in former times due to the queen, under the name of Queen-gold. Charles I. purchased it from his consort, Henrietta Maria, in 1635, for £10,000, but it was not renewed at the Restoration. The queen-consort is exempt from paying toll, and from amercements in any court. She has a household of her own, consisting of six Ladies of the Bedchamber, a Lord Chamberlain, Vice-chamberlain, Mistress of the Robes, Master of the Horse, and three Equerries, as also her Attorney-general and Solicitor-general, distinct from those of the king, who are entitled to take a place within the bar along with the King's Counsel, and prosecute suits in law and equity for the queen. It has been the usual practice to crown the queen-consort with solemnities similar to those used in the coronation of the king. In the case of Queen Caroline, consort of George IV., who was living apart from her husband, this was not done, though her right to coronation was argued by Mr Brougham before the Privy Council. Certain rents or revenues were anciently appropriated to the income of the queen, but no separate revenues seem ever to have been settled on any queen-consort by parliament. Her personal expenses are defrayed from the king's privy purse.

The *Queen-dowager* is the widow of the deceased king. She retains most of the privileges which she enjoyed as queen-consort, nor does she lose her dignity by re-marriage; but it has been held that no one can marry the queen-dowager without permission from the king, on pain of forfeiture of lands and goods. On the marriage of a king, or accession of an unmarried prince, parliament makes provision for the queen's maintenance, in case of her survivance. An income of £100,000 a year, with two residences, was settled on the queen of George III.; and the same provision was made for the late Dowager Queen Adelaide, at the commencement of the reign of William IV. The queen-dowager, when mother of the reigning sovereign, is styled the Queen-mother. Until the time of George II., queens-consort bore the arms of the king impaled with their paternal coat, with the king's dexter and their paternal sinister supporter; since that period, they have used both royal supporters. It is not usual to place the arms of the queen-consort within the Garter.



The *Queen-regnant* is a sovereign princess who has succeeded to the kingly power. In modern times, in those countries where the Salic law does not prevail, on failure of males, a female succeeds to the throne. By an act of Queen Mary, the first queen-regnant in England, it was declared 'that the regall power of this realme is in the quene's majestie as fully and absolutely as ever it was in any of her most noble progenitours kinges of this realme;' and it has since been held, that the powers, prerogatives, and dignities of the queen-regnant differ in no respect from those of the king. The husband of the queen-regnant is her subject; but in the matter of conjugal infidelity, he is not subjected to the same penal restrictions as the queen-consort. He is not endowed by the constitution with any political rights or privileges, and his honours and precedence must be derived from the queen. The late Prince Consort was naturalised by 3 and 4 Vict. c. 1, 2, words being used which enabled him to be a privy-councillor, and sit in parliament; and by 3 and 4 Vict. c. 3, Queen Victoria was empowered to grant him an annuity of £30,000; but it was provided that His Royal Highness was not, by virtue of his marriage, to acquire any interest in the property of her Majesty. By a decree of the Queen, Prince Albert enjoyed place, pre-eminence, and precedence next to her Majesty.

A queen-regnant is the only woman who is in her own right entitled to bear her arms in a shield and not in a lozenge. She is also entitled to the exterior ornaments of helmet, mantling, crest, and motto, and may surround her shield with the Garter, and the collars and ribbons of all other orders of knighthood of which she is sovereign.

QUEEN ANNE'S BOUNTY, the name given to a fund appropriated to increase the incomes of the poorer clergy of England, created out of the first-fruits and tenths, which before the Reformation formed part of the papal exactions from the clergy. The first-fruits are the first whole year's profit of all spiritual preferments, and the tenths are one-tenth of their annual profits, both chargeable according to the ancient declared value of the benefice; but the poorer livings are now exempted from the tax. Henry VIII., on abolishing the papal authority, annexed both first-fruits and tenths to the crown; and statute 2 and 3 Anne, c. 11, first formed them into a perpetual fund for the augmentation of poor livings. The Archbishops, Bishops, Deans, Speaker of the House of Commons, Master of the Rolls, Privy Councillors, Lieutenants, and *custodes rotulorum* of the counties, the Judges, Queen's Serjeants-at-law, Attorney and Solicitor-general, Advocate-general, Chancellors and Vice-chancellors of the two Universities, Lord Mayor and Aldermen of London, and mayors of the several cities; and by supplemental charter, the Officers of the Board of Green Cloth, the Queen's Counsel, and the four Clerks of the Privy Council, were made a corporation by the name of 'The Governors of the Bounty of Queen Anne, for the Augmentation of the Maintenance of the Poor Clergy;' and to this corporation was granted the revenue of first-fruits and tenths. The income from first-fruits and tenths together is about £14,000 per annum, and it is appropriated from year to year in capital sums, either to increase, by the accruing interest, the income of the incumbents, to purchase land for their benefit, or to erect residences for them. At present, the mode of appropriating augmentations to livings is by granting £200 to meet each approved benefaction offered by individuals to obtain such grants. The governors have also had the distribution of eleven sums of £100,000 each, voted by parliament from 1809 to 1820, to augment the incomes of the clergy. They present annually an account of their receipts and expenditure to parliament.

QUEEN ANNE'S FARTHINGS. The farthings of Queen Anne have attained a celebrity from the large prices sometimes given for them by collectors.

Their rarity, however, has been much overrated; it was, indeed, long a popular notion that only three farthings were struck in her reign, of which two were in public keeping—a third was still going about, and, if recovered, would bring a prodigious price. The Queen Anne farthings were designed by a German of the name of Crocker or Croker, principal engraver to the Mint; and were only patterns

Queen Anne's Farthing.

of an intended coin, having never been put into circulation; but they are by no means exceedingly scarce. Some of them have raised letters, and on the reverse, the four shields of England, France, Scotland, and Ireland, arranged as a cross, and separated by fleurs-de-lis. Those with sunk letters are less frequently met with—some of which have for obverse Peace on a car, others Britannia under a canopy. A few of them were struck in gold.

QUEEN CHARLOTTE ISLAND AND QUEEN CHARLOTTE SOUND. See VANCOUVER ISLAND.

QUEEN OF THE MEADOW. See SPIRÆA.

QUEEN-POST, the side or secondary upright ties in a trussed-roof. See ROOF.

QUEEN'S BENCH, or KING'S BENCH, one of the three superior courts of common law in England, the other two being the Courts of Common Pleas and Exchequer. The Court of King's Bench was so called from the origin of the court, inasmuch as the king used to sit there in person. In Cromwell's time, it was called the Upper Bench. The court consists of five judges, a chief-justice (who is called the Chief-justice of England, and is the highest of all the judges next to the Lord Chancellor), and four puisne judges called justices. Though the court has long been fixed permanently in Westminster Hall, London, yet it may sit anywhere in England, and may follow the sovereign's person. There is an appeal from most of the decisions of the Q. B. to the Exchequer Chamber, which consists of the judges of the two other common law courts, and from thence to the House of Lords. The ancient jurisdiction of the court, and the history of its modifications, are too technical to be stated in this place, but the outline of the leading points of jurisdiction may be shortly stated. The Q. B. is the highest court which has a criminal jurisdiction, and such jurisdiction is unlimited. But practically, this jurisdiction is seldom exercised originally, for it is only when an indictment is removed from an inferior court into the Q. B. that a criminal trial takes place there, and this is only the case when there is some peculiar difficulty or importance attending the trial, which renders it expedient to remove it from the sessions or assizes. But though criminal trials in the Q. B. are exceptional, there are certain criminal matters which are part of its ordinary administration. A criminal information, for example, when filed by the Attorney-general, or the master of the Crown-office, charging a person with a criminal offence, is tried in the Q. B. as a matter of course, and can be tried in no other court. The Q. B. exercises a superintending control over all inferior tribunals, and also over public bodies, by commanding them to do a specific duty, the writ being called a writ of Mandamus; or by prohibiting them from going on with some matter over which they have no jurisdiction, by a writ called a writ of Prohibition. The Q. B. also entertains appeals from justices of the peace on a great variety of matters. Besides the criminal jurisdiction, and the prerogative writs of Mandamus, Prohibition, and Quo Warranto, there is a civil jurisdiction belonging to the Q. B. of the most extensive kind; indeed, any civil action to recover debts and damages may be brought there. The civil jurisdiction is, however, shared in common with the other two common law courts. The judges of the Q. B. are often called the Queen's Coroners, having a universal jurisdiction of that kind throughout England, though seldom acting in that capacity. The Chief-justice has latterly been usually made a peer, or has the option of becoming one if he pleases. The officers of the court are the Master of the Crown-office, who attends to the criminal department of the business, and several masters of the court, who attend to the civil department. The puisne judges of the Court of Q. B. rank before those of the other two courts.

QUEEN'S COLLEGE, Oxford. In 1340, Robert de Eglesfield, chaplain or confessor to Queen Philippa, founded, by licence from Edward III., a collegiate hall in Oxford, under the name of the Hall of the Queen's Scholars. In his statutes he sets forth his motives and objects with unusual minuteness. Theological study was the main object of the foundation. Residence was rigidly enforced, and poverty enjoined with peculiar force. The original number of the provost and fellows was to be 13, in memory of our Lord and the 12 apostles; and the ultimate number of poor boys to be educated on the foundation was 72, in memory of the 70 disciples. Few colleges, however, have disregarded more directly the wishes of their founders. When the Commissioners under 17 and 18 Vict. c. 81, began their work, they found the poverty required changed into a provostship of £1000 a year, and fellowships of £300, the conditional preference to north-countrymen converted into an absolute exclusion of all others; and the 72 poor children represented by 8 'taberdars,' as they are called, who were alone eligible to fellowships. A separate foundation had been given to Queen's by John Michel, Esq., in 1736, consisting of 8 open fellowships, and 4 open scholarships. The Commissioners introduced great changes. The foundations are consolidated, and the college now consists of a provost, 19 fellows, 15 scholars or taberdars, and 2 Bible-clerks. There are also upwards of 20 exhibitions in this college, ranging from £30 to £100 per annum, confined for the most part to natives of the northern counties. There are 28 benefices in the gift of this college, and also the principalship of St Edmund Hall.

QUEEN'S COUNSEL are certain barristers who receive from her Majesty a patent giving them preaudience over their brethren, and but for which they would rank only according to seniority of their standing as barristers. The advantage of appointing Queen's Counsel is this, that it enables the most able or successful counsel to take precedence of those of the same or longer standing, and to take the chief conduct of causes. In practice, there are almost invariably two counsel engaged on each side, called a leader and a junior, and the leader is generally a Queen's Counsel, and the junior is not. The appointment is made by the crown, on the nomination of the Lord Chancellor. The practice of appointing crown counsel is adopted in Ireland, but not in

Scotland. In the Courts of Chancery in England, it is usual for a Queen's Counsel to confine himself to a particular Vice-Chancellor's court, or to that of the Master of the Rolls, so that his clients may always reckon on his attendance there; and when he goes into another court, he requires an addition to his fee. In the common law courts, however, this arrangement is impracticable, and has never been adopted. It is sometimes popularly believed that the appointment of Queen's Counsel entitles the counsel to a salary from the crown; but this is a mistake, except as to the Attorney and Solicitor-general. When a Queen's Counsel is engaged in a criminal case against the crown, as, for example, to defend a prisoner, he requires to get special licence to do so from the crown, which is always given, as a matter of course, on payment of a small fee. In courts of law and equity, a Queen's Counsel is entitled to precedence over all other counsel, except those who were appointed Queen's Counsel before him. A Queen's Counsel has precedence over all Serjeants-at-law, though many of the latter obtain patents of precedence, which also make them in effect Queen's Counsel, as well as serjeants, and prevent them being displaced by those who come after them. The order of Serjeants-at-law is much more ancient than that of Queen's Counsel, though now it is in point of rank inferior. The practice of appointing Queen's Counsel is not older than the time of Sir Francis Bacon, who was the first appointed.

QUEEN'S COUNTY, an inland county of the province of Leinster, Ireland, is bounded N. by the King's County, E. by Kildare and Carlow, S. by Kilkenny, and W. by Tipperary and King's County. Area, 424,854 acres, of which 342,422 are arable. Pop. in 1871, 77,071; in 1861, 90,750, of whom 79,959 were Catholics, and the rest Protestants, 9854 of whom were of the Established Church. The number of acres under crop in 1863 was 143,618; cattle, 57,580; sheep, 90,311; pigs, 24,069. Q. C., for the most part, is within the basin of the Barrow, which is the principal river, and is partly navigable for barges. On the north-western border lie the Slieve Bloom Mountains, and the Dysart Hills occupy the south-east; the rest of the surface being flat or gently undulating. In its geological structure, it belongs to the great limestone district; but the Slieve Bloom Mountains are sandstone, and the Dysart Hills include coal, but not in deep or profitably-worked beds. Coarse linen and cotton cloths are manufactured in small quantities. The chief town is Maryborough; pop. 2500. Q. C. anciently formed part of the districts of Leix and Ossory; and after the English invasion, on the submission of the chief O'More, the territory retained a qualified independence. Under Edward II., the O'Mores became so powerful, that for a long series of years, an unceasing contest was maintained by them with the English, with various alternations of success. In the reign of Edward VI., Bellingham, the Lord-deputy, succeeded in re-annexing the territory of the O'Mores to the Pale (q. v.); and a new revolt in Mary's reign led to strong and successful measures, by which it was finally reduced to a shire, under the name Q. C., given to it in honour of Mary, from whom also the chief town, Maryborough, was called. There are a few antiquities of interest—a perfect round tower, and two in a less perfect condition, and some ecclesiastical and feudal remains, the most important of the latter being a castle of Strongbow on the picturesque Rock of Dunamare. Q. C. is traversed by the Great Southern and Western Railway, and also by a branch of the Grand Canal. It returns two members to parliament.

QUEEN'S EVIDENCE. See KING'S EVIDENCE.

QUEE'NSFERRY, SOUTH AND NORTH.—South Q. is a royal and parliamentary burgh in Linlithgowshire, on the south shore of the Firth of Forth, about 9 miles west-north-west of Edinburgh. It was erected into a royal burgh in 1636, but was for centuries before a burgh of regality. The walks and scenery about South Q., with Hopetoun House and grounds on the west, and Dalmeny Park on the east, are very beautiful, and the town itself is a good deal resorted to for sea-bathing. The Forth—much wider both above and below the ferry—here narrows to a width of only about two miles. It receives historical mention as early as the middle of the 11th c., as the ferry across which royal personages passed when travelling between Edinburgh and Dunfermline. A railway-bridge across the firth at this point has long been talked of. Pop. (1861) 1230, within the parliamentary bounds. South Q. is one of the Stirling district burghs.—*North Queensferry*, a small village in Fifeshire, on the north shore of the Firth of Forth, opposite South Q.; pop. about 400.

QUEE'NSLAND. This new British colony occupies the whole of the north-eastern portion of Australia, commencing at a point of the east coast about 400 miles north of Sydney, called Point Danger, in lat. 28° 8′ S. The greater portion of the southern boundary-line is formed by the 29th parallel of south latitude. The eastern seaboard extends about 1300 miles to Cape York, the extreme northern point of the continent, in lat. 10° 40′. The mean breadth of the territory is 900 miles, from the eastern coast-line to the meridian of 138 E. long., which forms the western boundary-line. This includes the greater portion of the Gulf of Carpentaria, which has a seaboard of about 900 miles. The whole of Q. comprises 678,600 sq. m.—nearly twelve times the area of England and Wales.

The portion of the colony extending along the eastern coast, is indented with numerous bays, which are the outlets of many navigable rivers, having their sources in the cool gorges and deep recesses of a great mountain-range, running north and south, parallel with the sea-coast, at a distance of from 50 to 100 miles. The summits of this great 'dividing range,' rise from 2000 to 6000 feet above the level of the sea. Numerous spurs are given off from the range in ridges sloping gradually towards the coast. These ridges are generally composed principally of quartz, and in many places form good natural roads for a considerable distance. The ridges are usually covered with a variety of fine and valuable timber. The iron-bark, blood-wood, box, and other descriptions of wood, very valuable to the farmer for fencing and building, are found here in great abundance.

Unlike almost every other portion of Australia, Q. is correctly described as 'a land of rivers and streams.' These rivers find an outlet in the many large and beautiful bays and estuaries on the eastern seaboard. One of these, Moreton Bay (q. v.), receives the waters of five rivers, which are always navigable. The largest of these, the Brisbane, is navigated by good-sized steamers for 75 miles, and is nearly a quarter of a mile wide at a distance of 15 miles from its mouth. The principal rivers on the eastern seaboard are the Logan, the Brisbane, the Mary, the Caliope, the Boyne, the Fitzroy, the Pioneer, and the Burdekin. The longest tidal river in Q. is the Fitzroy, which drains an area of not less than 50 millions of acres, and is navigable as far as Yaruba, 60 miles from its estuary in Keppel Bay. It receives, as its principal tributaries, the Dawson, Mackenzie, and Isaacs, large streams flowing for

NEW SOUTH WALES

several hundred miles from the north west, west, and south western parts of the interior. The tide at Rockhampton (40 miles from the embouchure of the river) rises 14 feet, and the stream is thus rendered navigable for vessels of considerable burden.

The banks of the rivers are usually well elevated, and in many places consist of very rich alluvium, brought down from the great mountain-ranges. This alluvial soil is frequently of very great depth, and is marked everywhere by a magnificent growth of timber, very unlike the ordinary Australian wood. The enormous fig-trees and gigantic eucalypta tower aloft, and spread out their great arms, festooned with vines and flowering parasites, which throw themselves over every spreading branch, and deck it with their varied and brilliant colours; the tall pine-trees shoot up their straight stems to a great height; while the cedar, the myrtle, the rosewood, and tamarind trees, display their rich and green foliage in every variety of shade. A thick evergreen hedge of mangroves covers the banks, preserving them from the wash of the stream; and at certain seasons of the year, this is fringed with thousands of flowering lilies.

Ordinarily, the eastern sea-board part of the country assumes very much the appearance of park-scenery in Great Britain, the trees standing at some distance apart, and the ground between them being covered with grass, which is generally green and luxuriant throughout the whole year. The regularity of the showers which fall in the summer season keeps the grass growing with luxuriant verdure generally during the hot months. Exceptions to this sometimes occur, and a dry summer appears to have been experienced in this part of Australia about once in every six or seven years. The summer of 1863 formed one of these exceptional seasons. The frosts of winter being generally so slight as not to injure the vegetation, the country is almost always green from January to December.

Beyond the 'Andes,' or great dividing-range, the country presents features of still greater beauty and fertility. Vast plains—10, 15, or 20 miles across—stretch out their level surface unbroken by a single tree, but covered with luxuriant grass, and often purpled over with fragrant herbage. These great plains are composed of rich black soil. They are well watered with a network of streams, which trickle down from the gradual slopes of the mountain-range. The soil in this locality is admirably adapted for tillage; and within a certain distance of the mountain-range, the rains fall with great regularity. The land here is lightly timbered, and is cleared with less labour than on the lower lands, and the soil is proved to be peculiarly adapted for the growth of wheat of the finest quality. The yield per acre in this locality has sometimes been as much as 50, and even 60 bushels to the acre, of 63 lbs. to the bushel. The average yield may be estimated at 30 bushels per acre. Indian corn and other cereals, as well as all the European fruits, grow luxuriantly, and come to the greatest perfection in this highly-favoured locality, which has been called the 'Garden of Queensland.'

This country, west of the great dividing-range, stretches away in a series of fine plateaux for a distance of 400 or 500 miles westward, and, with the interruptions of other mountain-ranges crossing the main range at right angles, for upwards of 1000 miles towards the fertile plains bordering the shores of the Gulf of Carpentaria.

A third distinct portion of Q. is formed by the country which falls off in a succession of steep declivities, or more gradually descending terraces, from the table-land thus described towards the lower land, which then intervenes between these terraces and the western boundary line of the colony, in Central Australia. This portion of the territory has been rendered specially interesting from the recent discoveries, which have shown that instead of a vast and sterile desert of burning sands, the interior of Australia is with exceptional patches of very limited extent, well grassed and watered, and suitable for pastoral, and in many places even for agricultural occupation.

The climate of Q. is said closely to resemble that of Madeira (q. v.); the mean annual external shade-temperature taken at Brisbane being very nearly the same as at Funchal in Madeira, though it is a little hotter in the summer, and colder in the winter at Brisbane than at Funchal. Moreton Bay, now Q., has for many years been the resort of invalids from all the other British colonies in the southern hemisphere, and has been called the Montpellier of Australia. The summer season is hot—the thermometer rising sometimes to 90° or even 100° in the shade; but the air is dry, elastic and healthy, and the sea-breezes temper the heat, and make it perfectly endurable, even to the out-door labourer, in the hottest time of the year. However hot the day, the night is almost invariably cool, even in the most northern parts of the colony.

The capital of Q., and the seat of the local government, is Brisbane (q. v.), pop. 15,000. Its situation is described as exceedingly beautiful. Ipswich, Rockhampton, Maryborough, Toowoomber, Gayndah, Dalby, and Bowen, are rapidly rising towns. Rockhampton has already attained great importance, and promises ere long to be the metropolis of Queensland. Although only recently established, its population already exceeds 5000 souls, and is rapidly increasing. Situated upon the largest navigable river of Q., it forms the commercial centre and principal outlet of immense tracts of the interior country. A railway is in process of construction from Rockhampton to Westwood in the direction of Peak Downs, where extensive copper mines, said to vie in richness with those of Burra Burra, have been opened up, and valuable gold deposits are also being worked.

The Alienation of Crown-lands Act, passed during the first session of the colonial parliament, revolutionised the old plan of selling land at a high upset price at auction, and established a system in its stead which is thus described in an official document issued from the Queensland Government Emigration Office in London: 'The Queensland Land Act enables small capitalists to choose their farms themselves on any of the Agricultural Reserves throughout the colony; and these reserves are situated within about five miles of all the larger towns, where there is a market for farm-produce. Each reserve contains at least 10,000 acres, already surveyed, and marked out in farms of from 18 to 320 acres. The price at which the land on the reserves is sold is a fixed price of £1 per acre; but this amount being paid for, say 40 acres, the purchaser is entitled to lease from the government three times as much—that is, 120 acres more, adjoining the piece he has bought, at a rent of 6d. per acre a year, for five years; and at the end of this time, he may secure the fee-simple of this leased portion by paying the government £1 an acre for it, after having had the use of the land at this mere nominal charge. The farmer cannot purchase less than 18 acres on the reserves, and must pay £18 for it; but his land-orders are received by the government at their full nominal value of £30 towards the payment

for the portion which he has purchased. Each adult passenger in the family is entitled to land-orders of the value of £30'—which land-orders are exactly the same as 30 sovereigns in purchasing land from the government. The quantity of land taken up on the agricultural reserves by purchase and lease on the terms above described during the year 1862, was 17,134 acres.

The operation of the land and emigration scheme thus established appears to have been most successful. An officer, under the title of Agent-general, appointed for the purpose by the local government, has been engaged in Great Britain in making known and controlling this movement; and as many as nearly 20,000 persons have emigrated to Q. under his direction during the first three years and a half.

The system of free grants of land to persons paying their own full passages, has had the intended effect of attracting a large number of small and larger capitalists; while a system of assisted and free passages, established by a wise adoption of the same land-order system, has freely supplied a class of industrious mechanics, farm-labourers, and general servants. Notwithstanding this, the demand for labour of all kinds is still on the increase.

The agricultural capabilities of Q. are not confined to the elevated table-lands before alluded to as 'the Garden of the Colony.' On the lower lands, on the rivers and bays, and on the fertile valleys and sunny slopes of the eastern side of the range, there are many millions of acres of land immediately available for settlement, and admirably suited for tillage. In this portion of the colony, settlement is advancing by a class of small proprietary farmers. The land is described as very productive, yielding two crops in the year, and capable of producing almost everything that can be grown in any part of the world. Oranges, pine-apples, figs, bananas, grapes, mulberries, peaches, nectarines, granadillas, alligator pears, guavas, flourish in great perfection and abundance, and are seen growing up side by side with wheat, maize, potatoes, and all the fruits, flowers, and vegetables of Northern Europe.

The cultivation of cotton appears likely to be carried on to a large extent. The cotton-plant is said to be indigenous in this part of Australia, and in consequence of the absence of severe frosts, it is also perennial. In the Reports drawn up by the most competent judges, on the samples of cotton from all parts of the world, at the International Exhibition, we find it stated: 'The samples of Sea Islands' cotton from the Australian colonies are far superior to cotton from any other part of the world.' The New Orleans' variety from Q. is also spoken of in the Report as 'particularly good.' Seven medals were awarded to Q. growers, and the distinction of honourable mention was conferred on five more. The average yield per acre was estimated at 400 lbs. of Sea Islands, and from 600 lbs. to 700 lbs. of Orleans; being two-thirds in excess of the average yield of the two sorts taken together in America, which is 300 lbs. per acre. Later seasons have proved unfavourable for the new enterprises by the occurrence of two wet winters—the cotton-picking season in Q.; this has been quite exceptional, the weather at this season of the year being ordinarily beautiful, fine, and dry. In spite of this unfavourable circumstance, however, several farmers have done well with the cotton, and in one or two cases realised from 250 to 350 lbs. of clean cotton to the acre. It seems likely the average yield of Sea Islands will be about 300 lbs. per acre. With these advantages, and with the rapid emigration to the colony, there seemed for a time reason to believe they would be able in Q. to compete successfully with cotton of American growth, and produce it in large quantities, grown by European labour, at a good paying profit, to sell in Liverpool at ordinary prices. Several cotton-growing companies and a considerable number of private individuals engaged in cotton-growing in Q., but though in 1869, 14,426 acres were under cotton, an increase of 30 per cent. over that of 1868, only 12,181 cwt. of raw cotton were exported in that year.

Q. is a great pastoral country; the quantity of live-stock now pastured within the colony, as shewn by the *Queensland Statistical Register*, being as follows: horses, 71,000; cattle, 994,000; sheep, 8,646,000; pigs, 29,000. It was an idea generally received until within the last few years that the quality of Australian wool would degenerate as the sheep were driven towards the north. The reverse of this, however, proves to be the case. The Q. wool is remarkable for the fineness of its quality; and this seems to be increasingly the case as the pastoral occupation of the country extends northwards towards the Plains of Promise on the Gulf of Carpentaria. The wool diminishes a little in quantity, the fleeces being lighter, but the increased fineness of the wool more than makes up for a little diminution in its quantity. The value of the exports of wool from Q. in 1868 was £1,980,149, and the total exports in 1869 amounted to £2,184,887. From this may be inferred the rapid occupation of the country for pastoral purposes. This has extended during the last six or eight years for hundreds of miles towards the western boundary, and for a still greater distance towards the shores of Carpentaria. Sheep and cattle are now pastured on the Flinders River within about 50 or 60 miles of the gulf, and stock is now being driven along the eastern shores of the gulf towards Cape York, where a Q. settlement has recently been formed at Somerset, at the extreme northern point of the island continent of Australia.

Q. was erected into a separate and independent colony in December, 1859. The first representative of the Queen is Samuel Wensley Blackall. His advisers consist of four cabinet ministers, and a few of the highest officials. There are two Houses of Parliament—the Legislative Council, nominated at present by the governor; and the Legislative Assembly, elected by the people. The suffrage is not universal, but within the reach of every industrious man, who has undergone no condemnation for any criminal act, after a twelvemonths' residence. State aid to religion has been abolished by act of the parliament.

An excellent system of primary education is in successful and vigorous operation throughout the colony. Grammar-schools are also liberally endowed by the government. The statistics of criminal courts prove that there is less crime in Q. than in Great Britain. The population in the beginning of 1865 was a little over 60,000, and on September 1, 1871, this vast territory contained only 120,104 souls of European descent.

QUEEN'S METAL, an alloy formed by fusing 100 parts of tin with 8 parts of antimony, 4 parts of copper, and 1 part of bismuth. It is a kind of Britannia metal, and is used for tea-pots and similar articles of domestic utility.

QUEEN'S REGULATIONS, or KING'S REGULATIONS, are those collections of orders and regulations in force in the army and navy respectively, which serve to guide commanding and other officers in all matters of discipline and personal conduct. The queen's regulations for the navy also in a great degree regulate matters of finance; whereas, in the army, financial matters are left to the War-office Regulations (q. v.). The reason for this distinction is, that, as regards the navy, the

Admiralty are responsible both for discipline and finance; while in respect to the army, the commander-in-chief controls the discipline under the direct orders of the sovereign, and the Secretary of State for War directs the finance, for which he is responsible to parliament. The regulations for the army were first collected in 1788, since which several editions have been issued, the last being in 1859. The latest Admiralty regulations bear date 1844. The current regulations are supplemented, corrected, and cancelled by numerous circulars and addenda; so that they never represent the whole body of military or naval rules for many days together.

QUEE'NSTOWN, called formerly COVE OF CORK, Ireland, a seaport town, on the south side of Great Island, in the harbour of Cork, is distant from Cork 14 miles east-south-east, and from Dublin 157 miles south-west-by-west. It rose into some importance during the French war, as the port of embarkation for troops going on foreign service, and is now an admiral's station. On the occasion of the Queen's visit in 1850, the name Q. was given to it in honour of her Majesty. The formation of the town is rather peculiar, as it occupies the sides of an amphitheatre, around which it is built in parallel streets. It enjoys a high reputation for its mild and salubrious climate, and is much frequented by invalids during the winter season. The population in 1861 was 8653, of whom 7240 were Catholics, 1262 Protestants of the Established Church, and the rest of other denominations.

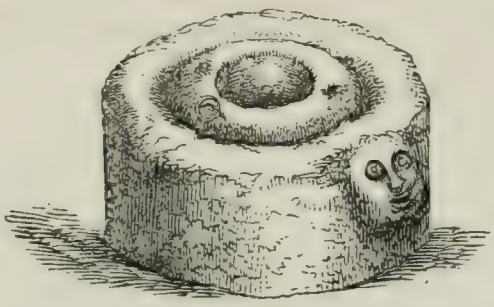
QUEEN'S YELLOW. See YELLOW COLOURS.

QUENTIN, ST, a thriving manufacturing town in the north of France, department of Aisne, is situated on the Somme, about 80 miles north-east of Paris. It is a station on the railway from Paris to Liége. Q. has a celebrated church—'one of the finest, boldest, and purest Gothic buildings in this part of Belgic Gaul.' Q. is the centre of the manufacture of linen, muslin, lace, and gauze. Pop. 28,880. The *Canal of St Quentin*, connecting the basin of the Somme with that of the Scheldt, was finished by Napoleon in 1810. It is carried through the intervening hills by tunnels. At St Q., a battle was fought, $\frac{\text{July 28,}}{\text{August 10,}}$ 1557, between the Spaniards, assisted by a body of English troops, and the French, in which the latter were severely defeated.

QUE'RCITRON, the name both of a dyestuff and of the species of oak of which it is the bark. This oak (*Quercus tinctoria*), also called *Dyer's Oak* and *Black Oak*, is a native of North America—one of the noblest forest trees of the United States, found in New England, and as far south as Georgia, although there only at a considerable elevation. The name Black Oak is given to it from the dark colour of its outer bark. The leaves are obovate-oblong, dilated outwards, and widely sinuated; with short, obtuse, and bristle-pointed lobes. The wood is reddish, coarse-grained, and porous, but much esteemed for strength and durability, and is used in America for shipbuilding. The bark is used for tanning as well as for dyeing. It is the inner bark which is the quercitron of dyers. It yields a yellow crystallisable substance, *Quercitrin* ($C_{19}H_{18}O_{16}+2H_2O$), which may be extracted by means of alcohol; the tannic acid, which is simultaneously taken up, must be precipitated by the addition of gelatine, after which the liquid will, on evaporation, yield crystals of quercitrin. On the addition of alum, its solution assumes a beautiful yellow colour; and solutions of acetate of lead, acetate of copper, and chloride of tin precipitate it in yellow flakes. When boiled with dilute acids, it breaks up into glycose and *quercetin* ($C_{19}H_{10}O_8$), a yellow crystalline substance which is soluble in alkaline solutions, to which it communicates a golden yellow colour. The decoc-

Branchlet and Acorn of the Quercitron (*Quercus tinctoria*).

tion shews that quercitrin belongs to the glycosides, or compounds which, when broken up, yield sugar.



QUERETA'RO, an important town of Mexico, capital of a state of the same name, is charmingly situated on a hilly plateau, 6365 feet above sea-level, 110 miles north-west of Mexico. It is built on a regular plan, contains 11 convents, 3 great squares, many richly-decorated churches, &c. Water is supplied from an aqueduct two miles long, and supported in part upon arches 90 feet high. The industry of the town is important, and is carried on with spirit. Woollen and cotton goods and leather are the chief manufactures. Q. contains the largest cotton-spinning mill in the country; 300 hands are employed in it. The peace between Mexico and the United States was ratified here in 1848. Pop. 47,570.

QUERN, a primitive mill for grinding corn, the stone of which was turned by the hand before the invention of windmills or water-mills. It is a contrivance of great antiquity, and so well adapted for the wants of a primitive people, that we find it perpetuated to the present day in remote districts of Ireland, and some parts of the Western Islands of Scotland. The remains of querns have been dug up in Britain, Ireland, and Continental Europe, wherever the traces of ancient population are to be found. They occur in the Scottish Weems (q. v.), or cyclopean underground dwellings; in the Crannoges (q. v.), or lake-dwellings of Ireland and Scotland; and the very similar *Pfahlbauten* of Switzerland; and abundantly among the remains of the Roman period in Britain and Northern Europe. The most usual form of quern consists of two circular flat stones, the upper one pierced in the centre with a narrow funnel, and revolving on a wooden or metal pin inserted in the lower. The upper stone is occasionally ornamented with various devices; in the Roman period, it is sometimes funnel-shaped, with grooves radiating from the centre. In using the quern, the grain was dropped with one hand into the central opening, while, with the other, the upper stone was revolved by means of a stick, inserted in a small opening near the edge. As early as 1284, an effort was made by the Scottish legislature to supersede the quern

by the water-mill, the use of the former being prohibited except in case of storm, or where there was a lack of mills of the new species. Whoever used the quern was to 'gif the threttein measure as multer;' the contravener was to 'tine [lose] his hand-mylnes perpetuallie.' This enactment did not, however, prevent hand-mills from being largely used in Scotland down to the beginning of the present century.

Probably the oldest type of quern is that which was fashioned from a section of oak; one of this description was found in Scotland in 1831, in the course of removing Blair Drummond Moss. It is 19 inches in height by 14 in diameter, and the centre is hollowed to a depth of about a foot, so as to form a mortar, in which the grain seems to have been pounded by a wooden or stone pestle.

A less simple variety of the stone quern, known as the Pot Quern, and also of great antiquity, consists of a circular stone basin, with a hole through which the meal or flour escapes, and a smaller circular stone fitting into it, perforated with an opening through which the grain was thrown into the mill. A number of querns of this description have been exhumed in Scotland, and still more in the bogs of Ireland, in which country the pot quern is believed not to be yet altogether disused. The subjoined wood-cut represents one in the Museum of

Quern.

the Scottish Antiquaries; it is of unusually large size, 17 inches in diameter, and 8½ high, and was discovered in the parish of Gladsmuir, in East Lothian. It is made of coarse pudding-stone, and is furnished with holes in the sides, to which handles were probably attached. The iron ring is a modern addition.—See Dr Wilson's *Archæology* and *Prehistoric Annals of Scotland*, vol. i. p. 211, *et seq.*, 2d edition (London and Cambridge, 1863).

QUESNAY, François, an eminent French economist and physician, was born at Mérey, near Montfort-l'Amaury, June 4, 1694, and studied at Paris, where, in 1718, he passed surgeon with a high reputation. He acquired a high reputation in his profession, and at his death, in 1774, was first physician to the king. But Q.'s fame depends almost wholly on his economistic speculations, which are to be found scattered through the pages of the famous *Encyclopédie* (see, for example, the articles 'Fermiers' and 'Grain'), the *Journal d'Agriculture*, and the *Ephémérides du Citoyen*. He is the inventor of the term 'Political Economy,' and one of the earliest and most distinguished writers on the subject. His views were systematically set forth in a little treatise, entitled *Tableau Economique*, which was nicknamed by La Harpe, the *Alcoran des Economistes*. Only a few copies of this work were printed about the end of the year 1758, and these have now all disappeared. Nevertheless, the principles maintained by Q. are well known, partly from the sources above mentioned, but chiefly from other treatises that have met with a better fate than the *Tableau*, viz., his *Maximes Générales du Gouvernement Economique d'un Royaume Agricole*, the *notes* to which occupy more space than the text; *Le Droit Naturel; Analyse du Tableau Economique; Problèmes Economiques;* and *Dialogues sur le Commerce et sur les Travaux des Artisans*, all of which are to be found in Dupont's *Recueil* of Q.'s writings (Leyden and Paris, 1768).

QUESNEL, Pasquier, a French theologian, was born at Paris, July 14, 1634, and having been educated in the Sorbonne, entered the Congregation of the Oratory in 1657. He obtained even early in his career the reputation of a profound familiarity with Scripture and the Fathers; and by several popular ascetical treatises which he published, he attracted so much notice, that, at the early age of 28, he was appointed director of the Paris house of his Congregation. It was for the use of the young men under his charge that he commenced the series of his afterwards celebrated *Reflexions Morales*. The first specimen of this work having been much admired, Q. continued to extend it to other portions of the New Testament. Soon afterwards, he published an edition of the works of St Leo (2 vols. 4to, Paris, 1675), which has been much criticised. His residence at Paris, however, was cut short by the disputes about Jansenism. Having refused to sign certain propositions, subscription to which was, by a decree of 1684, required of all members of the Oratory, Q. left the Congregation, and retired to the Low Countries, where he attached himself to the party of Arnauld, in which he speedily rose to the first position of influence and authority. He continued at Brussels his *Reflexions Morales;* and in 1693—1694, the Reflections on the New Testament were published in a complete form, with the approval of the Cardinal de Noailles, Bishop of Châlons, and ultimately Archbishop of Paris. The work, however, on examination, was found to contain all the most obnoxious doctrines of Jansenius; and Q., having been denounced to the authorities, was arrested, by order of Philip V., and put into prison. He escaped, and betook himself to concealment. But his book was condemned, first by the decree of an assembly of the bishops of France, and afterwards by a decision of Clement XI. in 1711, and finally by the celebrated bull *Unigenitus*, September 8, 1713. With this condemnation, the formal dogmatic declarations of the Roman Church on this controversy may be said to have ceased. The controversy continued, but nothing, or very little, that was new was afterwards elicited. Q. withdrew to Amsterdam, where he lived to a great age, not having died till 1719, in his 85th year. Besides the *Reflexions Morales*, he left a vast number of treatises, chiefly ascetical. The few dogmatical essays which he published, as well as his critical edition of St Leo, are all tinged with his peculiar opinions. The *Reflexions Morales* falling in, in the main, with the views of one of the religious parties in the Protestant Church, has been translated into German and English, and at one time enjoyed considerable popularity both in England and in Germany.

QUETELET, Lambert Adolphe Jacques, a celebrated Belgian statistician and astronomer, was born at Ghent, 22d February 1796, and studied at the lyceum of his native city, where, in 1814, he became Professor of Mathematics. In 1819, he was appointed to the same chair at the Brussels Athenæum; and in 1826, was chosen by King William I. to superintend the construction of the Royal Observatory in the capital, of which he became director in 1828. In 1836, he was made Professor of Astronomy and Geodesy at the Brussels Military School.

Elected a member of the Belgian Royal Academy in 1820, he became perpetual secretary in 1834. Q. is besides a corresponding member of the Institut de France and of the Royal Society of London. Among his numerous and valuable writings are—*Astronomie Élémentaire* (Par. 1826; 4th ed. Brux. 1848), *Recherches sur la Population, les Pauvres, les Dépôts de Mendicité*, &c., *dans le Royaume des Pays-Bas* (Brux. 1827); *Recherches sur la Reproduction et la Mortalité et sur la Population de la Belgique* (Brux. 1832); *Statistique Criminelle de la Belgique* (Brux. 1832); *Sur l'Homme et le Développement de ses Facultés ou Essai de Physique Sociale* (Par. 1835); *Du Système Sociale et des Lois qui le régissent* (Par. 1848); and *Physique* (Brux. 1850). Q. has also been one of the most efficient collaborateurs in drawing up the *Bulletin de la Commission Centrale de Statistique*, the *Annales des Mines*, the *Journal des Economistes*, the *Annales des Travaux Publics*, the *Trésor National*, &c. He has also published numerous papers on meteorology, astronomy, terrestrial magnetism, &c., in the *Mémoires* and *Bulletins* of the Belgian Royal Academy.

QUEVEDO Y VILLEGAS, Don Francisco Gomez de, a Spanish classic, was born at Madrid, 26th September 1580, and studied at the university of Alcala de Henares, where he acquired a good knowledge not only of Latin and Greek, but also of Hebrew and Arabic, besides French and Italian. His career, which was chiefly that of a diplomatist, was marked by numerous vicissitudes. He died 8th September 1645, at Villa Nueva de los Infantes.

The prose works of Q. are divisible into two classes—the serious and the burlesque. Among the former are his *Vision of St Paul*, *The Spanish Epictetus*, *Phocylides*, *Fortune become Reasonable*, and particularly *The Life of Marcus Brutus*, and *The Policy of God*—the last two of which are remarkable for the purity and elevation of their sentiments. Among his satirical and burlesque productions, in which his genius finds its happiest expression, the principal are—*The Dream of the Death's Heads*, *The Demon Alguazil*, *Pluto's Stables*, *The Side-scenes of the World*, *The Letters of the Knight of the Forceps*, *Recollections of Student Life*, and *The Grand Sharper, or the History of Don Pablo de Segovia*, a romance of rascaldom, a species of fiction much cultivated in Spain at that time, in which the hero is usually an adventurous scamp. The lively sallies, the piquant allusions, and the happy metaphors found in these books, have enriched Spanish literature with a crowd of proverbs and colloquial phrases. Q.'s poetry is also chiefly of a humorous character. His works have been often reprinted; the most complete edition is that by Sancho (Madrid, 11 vols. 1791—1794); a more recent collection is the one by M. Guerra y Orbe (Madrid, 1852). An English translation of Q.'s satirical works was published at Edinburgh in 1798; his *Sueños*, or Visions, among the most popular of all his productions, were also translated into English by Sir Roger l'Estrange (1708).

QUIBERON, a small fishing town of France in the dep. of Morbihan, at the extremity of a long slender peninsula, 25 miles south-west of Vannes. Pop. about 700. It is historically celebrated as the spot where a body of French emigrant royalists, under D'Hervilly and Puisaye, landed from an English fleet, on the 27th of June 1795, and endeavoured to rouse the people of Brittany and La Vendée against the Convention, but were defeated, and driven into the sea by General Hoche. All the prisoners taken were shot, by order of the Convention. At an earlier period, during the war of the Austrian Succession, an English force attempted a landing here (1746), but was severely repulsed. In 1759 Admiral Hawke completely defeated a French fleet under Admiral Conflans in Quiberon Bay.

QUICKENS. See Couch Grass.

QUICK MATCH, a combustible match, made by dipping cotton wick in a composition of vinegar, saltpetre, and sometimes an admixture of gunpowder; when lighted, it continues to burn to the end, and hence is useful in exploding mines, &c. The rate at which it burns being known, it is only necessary, for insuring safety, to take the right length of quick match.

QUICKSILVER. See Mercury.

QUIETISTS, the name of a small but conspicuous class of mystical sects, who, in different ages, have held that the most perfect state of the soul is a state of quiet, in which the soul ceases to reason, to reflect, whether upon itself or on God, and, in a word, to exercise any of its faculties, its sole function being passively to receive the internal heavenly light, which, according to their view, accompanies this state of inactive contemplation. Under the various heads, Fénelon, Hesychasts, Brethren of the Free Spirit, Molinos, Mysticism, most of the details of the doctrines of the Q. have been explained. Some of these are of a purely speculative character, and involving but little of practical consequence, whether for good or for evil. But there is one most pernicious class of errors, which, however eschewed by the leaders of the various schools, has seldom failed to characterise the practical working of the system among the vulgar crowd of its followers. From the belief of the lofty and perfect nature of the purely passive state of contemplation, there is but a single step to the fatal principle in morals, that in this sublime state of contemplation all external things become indifferent to the soul, which is thus absorbed in God; that good works, the sacraments, prayer, are not necessary, and hardly even compatible with the repose of the soul; nay, that so complete is the self-absorption, so independent is the soul of corporeal sense, that the most criminal representations and movements of the sensitive part of the soul, and even the external actions of the body, fail to affect the contemplating soul, or to impress it with their debasing influence. These results will be found detailed under some of the heads named above. The chief Quietist sects have been the Messalians or Euchites, in the 4th c.; the Bogomili, in the 11th c.; the Beghards and Beguines, in the 13th c.; the Hesychasts, in the East, about the same period; the Brethren of the Free Spirit, in the 14th c.; Michael Molinos, in the 17th c.; and others of less note.

QUILIMANÉ, a seaport of Eastern Africa, in the Portuguese territory of Mozambique, stands about 15 miles from the mouth of the river of the same name. The town itself, or village, stands on a large, moist mudbank (in any part of which water can be found by digging two feet deep), surrounded by mango-bush and marsh. The climate is unhealthy in an eminent degree. The bar at the harbour is extremely dangerous, and the volume of water is so small, that the bed of the small stream which communicates between the Quilimane and the Zambesi (q. v.) is dry for at least nine months in the year. During the dry season, trade is carried on by land-carriage. Pop. about 15,000, including the inhabitants of the country in the immediate vicinity of the town.

QUILLAIA, a genus of plants of the natural order *Rosaceæ*, the type of a tribe called *Quillajeæ*, with herbaceous calyx-tube, capsular fruit, and seeds winged at the apex. The sub-order is remarkable for saponaceous secretions. The barks of some

species of *Quillaia*, as *Q. saponaria* and *Q. Brasiliensis*, are used in South America, under the name of *Quillai*, as a substitute for soap. They contain a substance closely allied to *Saponine*.

QUILLED, in Heraldry, a term used in describing a feather, to indicate that the quill differs in tincture from the rest.

QUILLS, the large feathers of the wings of birds, the hollow tubes of which, being properly cleaned of all oily or fatty matter, and dried, are used for making pens to write with. The exact time of their introduction to use for this purpose is not known. Those plucked from geese are most generally used, but swan and turkey-quills are not uncommon, and for very fine writing, and for pen-and-ink drawing, crow-quills are preferred to all others. At one time, the collection and preparation of quills formed a very large and important branch of commerce; but the introduction of metallic pens has reduced it to very small limits. The following are the chief kinds sold by the dealers, and the list gives a correct indication of the sources of supply: Swan-quills, Iceland, &c.; English goose-quills, Irish goose-quills, Hudson's Bay goose-quills, Dutch goose-quills, St Petersburg goose-quills, Riga goose-quills, Turkey goose-quills, British crow-quills, duck-quills. Our imports amount to nearly 30,000,000 per annum, the value of which is about £25,000. Those of the swan fetch the highest price, or about four guineas per thousand; whilst the best goose-quills rarely exceed 20 shillings. After they have been carefully scraped and cleaned, the drying is effected by gentle heat in ovens, by which they acquire a necessary brittleness in a longitudinal direction. This is most important, as, without this property, we could not make the fine slit, upon which the whole working character of the pen depends.

QUI'LTOR, a fistulous wound about the top of the horse's foot, results from treads, pricks, or neglected corns, which lead to the formation of matter underneath the hoof. Any dead horn, matter, or other cause of irritation must be sought for by cutting away the hoof. A free opening must be provided for the egress of any pent-up matter. Poulticing for a few days is often useful; whilst healing may afterwards be expedited by the injection of any mild astringent lotion. The powerful caustics so frequently used, cause much unnecessary pain, and often aggravate the evil.

QUIMPER, an old town of France, capital of the department of Finistère is prettily situated on the Odet, about 9 miles from its mouth, and about 35 miles south-east of Brest. Its cathedral, a stately and richly-carved and ornamented edifice, commenced in 1424, is the principal building. Potteries are in operation, as well as tanyards, breweries, &c.; and sardine-fishing is actively carried on. Pop. 11,488.

QUIN, James, a celebrated actor of Irish descent, was born in London, 24th February 1693, and made his first appearance on the stage in 1714 at Dublin as Abel in *The Committee*. Shortly after, he proceeded to London, where he was engaged at Drury Lane, but for quite inferior parts. In 1716, however, the sudden illness of a leading actor led to Q.'s being called on to sustain the character of Bajazet in the once famous play of *Tamerlane*. His success was marked. Next year, he exchanged Drury Lane for Mr Rich's theatre at Lincoln's Inn Fields, where he remained as a principal actor 17 years. Not long after leaving the former place, he had the misfortune to kill a brother-actor, Mr Bowen, in a duel—a circumstance which clouded his reputation for a while. The only really fine parts which he seems to have played were Captain Macheath in the *Beggars' Opera*, and Falstaff in the *Merry Wives of Windsor*. In 1734—1735, he returned to Drury Lane Theatre, 'on such terms,' says Cibber, 'as no hired actor had before received;' and from this date until the appearance of Garrick in 1741, he was, by universal consent, the first actor in England. Q. was by no means pleased at the rising fame of Garrick, and sarcastically expressed his chagrin by declaring that 'Garrick was a new religion, and that Whitefield was followed for a time; but they would all come to church again.' In this, however, he was mistaken. In 1751, he withdrew from the stage as a hired actor, though he continued at intervals to give his services for benevolent purposes, and fixed his residence at Bath, where he died January 21, 1766. In after-dinner conversation, he was a coarse but capital story-teller, and many of his jests are still in vogue.

QUINCE (*Cydonia*), a genus of trees and shrubs of the natural order *Rosaceæ*, sub-order *Pomeæ*, nearly allied to *Pyrus*, with which many botanists have united it, but distinguished by having many instead of two seeds in each cell, and by their very mucilaginous nature. The Common Q. (*C. vulgaris*), a native of the south of Europe and temperate parts of Asia, is a low tree, with generally tortuous branches; ovate, entire, deciduous leaves, which are downy on the under side; and rather large, whitish

Common Quince (*Cydonia vulgaris*).

flowers, which are solitary at the extremity of young branches. The fruit is in some varieties globose; in others, pear-shaped, of a rich yellow or orange colour, with a strong smell. It is hard and austere, but when stewed with sugar, becomes extremely pleasant, and is much used in this way either by itself, or to impart a flavour to apple-pies. It is also much used for making a preserve called *Quince Marmalade*. A delicious beverage, somewhat resembling cider, is made from it. The seeds readily give out their mucilage to water, so that they turn 40 or 50 times their weight of water into a substance as thick as syrup. Q. mucilage, or Q. gum, *Cydonin*, is allied to Bassorin, but differs from it in being readily soluble in water, whilst it differs also in some particulars from Arabin. See Gum.—The Q. was cultivated by the ancient Greeks and Romans, and is at the present day cultivated in the south of Europe, in England, and generally in temperate climates. In Scotland, the fruit seldom ripens except on a wall.—The Japanese Q. (*C. Japonica*, better known by its older name, *Pyrus Japonica*), a low bush, a native of Japan, but perfectly hardy in Britain, is often to be seen trained against walls, being very ornamental from the profusion of its beautiful flowers.

QUI'NCY, a city of Illinois, U.S., on the east bank of the Mississippi River, 160 miles north of

St Louis, is handsomely built on a high bluff, and has a large trade by the river, railway connections with Chicago, Toledo, &c., extensive manufactures, three banks, five newspapers, and twenty-one churches. Pop. in 1870, 24,053.

QUINCY, Josiah, an American lawyer, orator, and man of letters, and son of Josiah Quincy, a distinguished orator of the Revolution, was born at Boston, February 4, 1772; graduated at Harvard College, 1790; studied the profession of law; took an active interest in politics as a leading member of the Federal party in New England; entered Congress in 1805, where he became distinguished as a ready, earnest, and fervent orator, in opposition to the policy of Jefferson and Madison. He was one of the earliest to denounce slavery in Congress, and declared that the purchase of Louisiana was a sufficient cause for the dissolution of the union. Disgusted with the triumph of the democratic party and the war of 1812, he declined a re-election to Congress, and devoted his attention to scientific agriculture. He became, however, a member of the senate of Massachusetts, and in 1822, judge of the Municipal Court of Boston. In 1823, he was elected Mayor of Boston; and in 1829 accepted the post of President of Harvard College, which he held until 1845. Among his published works are a Memoir of his father, 1825; *History of Harvard University*, 1840; *History of the Boston Athenæum*, 1851; *The Municipal History of the Town and City of Boston*, 1852; *Life of John Quincy Adams*, 1858; *Essays on the Soiling of Cattle*, 1859. Born before the American Revolution, in which his father took an active and distinguished part, he lived to denounce the secession of the Confederate States in 1860, and urge on the war for their subjugation. He died at Boston, July 3, 1864.—His son, Edmund Quincy, born in Boston, 1808, is a distinguished author and orator.

QUINET, Edgar, a French author, was born at Bourg, in the department of Ain, 17th February 1803, and studied at Lyon and Paris. He made his literary *début* at the age of 20 by his *Tablettes du Juif Errant*, after which his love of philosophy and mystic reverie led him to Germany. He studied at Heidelberg, and on his return to France published a translation of Herder's *Ideen zur Philosophie der Geschichte der Menschheit*, so well executed, that Cousin signalised it as *le début d'un grand écrivain*. From this early period dates his intimate friendship with Michelet (q. v.), the result of a community of feeling and belief. Q. was a member of the scientific commission sent to the Morea in 1828, and while there, gathered materials for his *Grèce Moderne et ses Rapports avec l'Antiquité* (Par. 1830). Although his political enthusiasm was extremely ardent, he continued unabated his learned literary labours; and after the July revolution, became a contributor to the *Revue des Deux Mondes*. From 1838 to 1842, he held the chair of Foreign Literature at Lyon, where his lectures on the ancient civilisations excited a profound interest. From this situation he passed to the chair of *Littératures Méridionales* at the College of France, expressly instituted for him by M. Villemain; and here, in company with Michelet, he assailed the Jesuits with a keen, earnest, epigrammatic eloquence that startled the chiefs of that body, and made even the government nervous, who knew the peril of being exposed to their secret hostility. In 1846, Q. was silenced. He threw himself eagerly into the Reform agitation that brought about the revolution of 1848, and was elected a member of the Constituent and Legislative assemblies, where he always voted with the Extreme Left; but was expelled from France, after the 2d of December. He subsequently resided at Brussels. Q.'s principal works are *Ahasvérus et Paris* (Par., 1833); *Histoire de la Poésie Unique* (1836–1857); *Examen de la Vie de Jésus de Strauss* (1838); *La Création* (1843); *Les Révolutions d'Italie* (2 vols., 1848); *Histoire de mes Idées* (1858); *Merlin l'Enchanteur* (1860); *La Campagne de* 1815 (2 vols., 1862). In 1858 he superintended with the help of his friends Daniel Manin, Ary Scheffer, and others, an edition of his *Œuvres Complètes* in 11 vols.

QUININE, or QUINIA, and the other Cinchona Alkaloids. In the barks of the different species of *Cinchona*, which are employed in the treatment of disease, several alkaloids or organic bases occur in combination with quinic and quinotannic acids. Of these bases, the most important are quinine and cinchonine, each of which is accompanied by (or connected with) two isomeric bases, termed respectively *Quinidine* and *Quinicine*, and *Cinchonidine* and *Cinchonicine*; and, besides these, a base termed *Aricine* or *Cinchovatine* occurs in the bark of *Cinchona ovata*. We shall describe (1) the *chemical characters*, and (2) the *therapeutic action* of these alkaloids.

1. *Quinine* ($C_{20}H_{24}N_2O_2$) is characterised by the following properties. It crystallises with six atoms of water, in the form of silky needles, from an ethereal or alcoholic solution allowed to evaporate spontaneously in a cool place; but when thrown down from acid solutions, it forms a white curdy precipitate. It is comparatively insoluble in water, requiring about 200 parts of boiling water for its solution, but dissolves readily in alcohol and in ether, and in water acidulated with a mineral acid. It has an intensely bitter taste, which is chiefly perceived at the back of the mouth; it has a well-marked alkaline reaction. It combines with acids, and forms both neutral and acid salts, most of which are capable of crystallisation, and all of which possess its own bitter taste. Of these salts, the acid ones are far the most soluble.

The most important of its salts is the *neutral* or *basic sulphate*, represented by the formula $2C_{20}H_{24}N_2O_2$. H_2SO_4. (It was formerly termed the disulphate, till Strecker shewed that the correct formula for quinine is $C_{20}H_{24}N_2O_2$, and not $C_{10}H_{12}NO$.) It crystallises in long snow-white silky needles, sparingly soluble in water (yet imparting to it a peculiar bluish tint), but dissolving freely in diluted sulphuric acid and in alcohol. The *acid sulphate*, $C_{20}H_{24}N_2O_2H_2SO_4.16H_2O$, is also crystallisable, and the crystals, when dried for some time at a temperature of 212°, are phosphorescent. Its solution, or an acidulated solution of the former salt, exhibits the phenomena of *Fluorescence* (q. v.) in a striking manner. On heating a solution of sulphate of quinine with strong acetic acid, and adding, drop by drop, an alcoholic solution of iodine to the hot solution, we obtain crystals of a compound represented by the formula $2C_{20}H_{24}N_2O_2.3H_2SO_4.I_6$. These crystals, which are formed in large flat rectangular plates, present very remarkable optical properties, polarising light as perfectly as plates of tourmaline.

This alkaloid may be obtained from several species of cinchona, but is most abundant in the yellow bark (*C. calisaya plana*). The pulverised bark is boiled with water containing 1 per cent. of oil of vitriol, which dissolves the bases that are present; the solution is precipitated by carbonate of sodium, and the quinine (with the other alkaloids) extracted from the precipitate by ether. For various methods of obtaining the sulphate of quinine on a large scale for medicinal purposes, we must refer the reader to Pereira's *Materia Medica*, 4th edition, vol. 2, part 2, pp. 147–149, and the *United States Pharmacopœia*, 1866, p.

274. The mother liquid from which sulphate of quinine has been obtained, contains a considerable quantity of a resinous amorphous substance known as *Quinoidine*, which, when treated with ether, yields crystals of *Quinidine* ($C_{20}H_{24}N_2O_2$), a base isomeric with quinine, from which again is derived another isomeric base, *Quinicine*.

Cinchonine ($C_{20}H_{24}N_2O$) crystallises in comparatively large quadrilateral prisms, which are anhydrous. It is less soluble in alcohol than quinine, and is insoluble in ether, and this difference of solubility affords the means of separating these two alkaloids. With acids it forms two series of salts similar to, but more soluble than, those of quinine. These salts are intensely bitter, and possess (although in a less powerful degree) the same therapeutic properties as those of quinine. In certain varieties of cinchona bark, a crystalline alkaloid named *Cinchonidine*, isomeric with cinchonine, occurs. On exposing its salts, or those of cinchonine, to a high temperature, corresponding salts of *Cinchonicine* are formed. The last-named substance has the same composition as the two preceding ones, and is precipitated from its salts in the form of a resinous mass. Cinchonine and its isomeric allies are most abundant in the gray Peruvian Bark (*Cinchona huanoco*). The method of obtaining cinchonine is precisely the same as that for obtaining quinine. When both bases are present, they may be separated by converting them into sulphates; the salt of quinine is the least soluble, and crystallises first.

The relations of the above-described alkaloids to polarised light have been carefully studied by Pasteur, and are very remarkable. Their respective effects on the plane of polarisation are as follows: Quinine produces a powerful left-handed rotation; quinidine produces a powerful right-handed rotation; quinicine produces a feeble right-handed rotation; cinchonine produces a powerful right-handed rotation; cinchonidine produces a powerful left-handed rotation; cinchonicine produces a feeble right-handed rotation. The action of these alkaloids thus affords an excellent illustration of the importance of circular polarisation as an aid to chemical analysis.*

2. The only preparations of the above-described alkaloids included in the *United States Pharmacopœia* are the *Sulphate of Quinine* and the *Valerianate of Quinine*. The latter is made by adding quinine prepared from the sulphate to an aqueous solution of valerianic acid and crystallising. It is peculiarly repulsive and bitter. Sulphate of quinine is a preparation which, from its high price, has always been liable to considerable adulteration; and specimens containing gypsum, chalk, magnesia, gum, starch, boracic and stearic acids, sugar, salicine, and sulphate of cinchonine, are not unfrequently met with. The first five may be detected by their insolubility in alcohol; boracic acid by the green tinge which it gives to the alcoholic flame; stearic acid by its insolubility in dilute acids; sugar by its solubility in cold water; salicine by the addition of oil of vitriol, which turns it red; and the sulphate of cinchonine by precipitating the suspected specimens by liquor ammoniæ, and then adding ether, when the quinine will be dissolved, but the cinchonine will float between the two liquids. (This test for cinchonine is recommended by the French government, who refuse to allow the sale of sulphate of quinine containing more than three per cent. of cinchonine.) The most important use of sulphate of quinine is in the treatment of intermittent fever, for which it may be regarded as a specific. Various nervous affections, especially if they assume a periodical character, are successfully treated by it — as, for example, neuralgia, chorea, certain forms of headache, &c. In numerous forms of dyspepsia, debility, and cachexia, there is no single remedy more effectual than the citrate of iron and quinine. The ordinary dose of the sulphate is from one to three grains, but in ague it may be given in far larger doses.* It may be prescribed in the form of pills made with conserve of roses, or as mixture, in which case a little sulphuric acid should be added to render it soluble. In large doses, as from 10 to 20 grains or more, it excites the nervous system, giving rise to headache, buzzing of the ears, blindness, giddiness—a group of symptoms collectively known as *Quininism;* and several deaths are recorded as arising from its administration in excessive doses. The average dose of the citrate of iron and quinine is 5 grains, which may be given in a glass of sherry. *Quinoidine* (also termed *Amorphous Quinine*) seems to be as efficient a tonic as sulphate of quinine, but not to have so great an anti-periodic power, and hence not to be so serviceable in intermittent fever, &c. *Quinidine* possesses the medicinal properties of quinine. Pereira and other physicians have found that its sulphate is equally serviceable with that of quinine both as a tonic and a febrifuge; and the action of *Quinicine* is similar to that of quinoidine. *Cinchonine* appears to act precisely the same as quinine; while *Cinchonidine* and *Cinchonicine* are of little therapeutic value.

Quinine is employed not merely in the cure of disease, but for the preservation of the health, when the system is exposed to certain noxious influences. Its value as a means of guarding the system from the attack of intermittent fever is so generally recognised, that the British Admiralty regulations require that every man should take quinine when the ship is within a certain distance of the east and west coast of Africa, and that it should be regularly continued in eight-grain doses every morning to those engaged in boat-cruising along the coasts or on the rivers or creeks. The author of 'A Visit to the Cities and Camps of the Confederate States,' in *Blackwood's Magazine* for January, 1865, observes that formerly it was considered certain death to sleep out for one night on James's Island, opposite Charleston, during the malaria season; but that thousands of men were then quartered on it. In the year 1863, when the taking of quinine was optional, there was a great deal of fever; in 1864 all were compelled to take their dose regularly every morning, and they were very healthy. It would appear, however, that quinine is not equally efficacious in guarding the system against all forms of intermittent fever, for Mr Meller, surgeon-naturalist in medical charge of Dr Livingstone's Zambesi expedition, found a glass of rum given at sunrise to be 'a far better prophylactic' than quinine in the fever of East Central Africa.

QUI'NISEXT (Lat. *quinque*, five, and *sex*, six), the name given to a council which, being regarded as a sort of supplement of the fifth and sixth generals,

* MM. de Vry and Alluard published a *Report* in 1864, in which they stated that the polaroscope reveals the presence of impurities in quinine when too small to be detected by any chemical process.

* Mr Desvignes (in a *Memoir* communicated on January 10, 1865, to the Royal Medical and Chirurgical Society) advocates the administration of solution of quinine by subcutaneous injection. The solution he employed was a grain and a half in 15 drops of water, acidulated with a drop of dilute nitric acid. With this he successfully treated several hundred cases of intermittent fever in the district of Tuscany, known as the 'Maremma,' in many of which the use of quinine and arsenic, administered in the ordinary way, had failed to effect a cure.

is called by a title which appears to combine both. In the same view, it is called by the Greeks *pentekte* (from *pente*, five, and *hecte*, sixth). The fifth general council, held in 553, on the subject of the Three Chapters (q. v.), enacted no canons of discipline. In like manner, the sixth, held against the Monothelites in 680, was confined almost entirely to doctrinal decisions. In order to supply the want, a numerous body of bishops, 211 in number, assembled in 692, in a hall of the imperial palace at Constantinople, called the Trullus. It was a purely oriental council, and not only was not approved by the Western Church and the pope, but was almost immediately reprobated. Its decrees are purely disciplinary; and it is chiefly important as being the council in which was laid down the broad distinction between the legislation of the East and that of the West on the subject of clerical celibacy. The Q. council, while prohibiting the marriage of any one who is in priest's orders, permits a married man to receive after marriage the order of subdeacon, deacon, or priest, but not of bishop. Against this, the Roman pontiffs vigorously protested. Another peculiar canon of this synod (57th) prohibits fasting on Saturday, even though in Lent. On these and other points of difference in discipline, no agreement has taken place between the churches down to the present time.

QUINOA (*Chenopodium Quinoa*), an annual plant, a native of Chili and the high table-land of Mexico. It much resembles some of the British species of *Chenopodium* (q. v.), has an erect stem, with ovate, angulate-toothed leaves, the younger ones pulverulent, and panicles much crowded and branched. In the countries in which it is indigenous, it is much cultivated for its seeds, which form the principal food of the inhabitants. The meal made from some varieties of the seed has a somewhat peculiar flavour, but it is very nutritious. Q. meal resembles that of oats in not becoming elastic and tenacious when mixed with water, and like oatmeal, can only be made into cakes, not into leavened bread. The plant is sometimes cultivated in our gardens for its leaves, which are a good substitute for spinach.

QUINQUAGE'SIMA SUNDAY (Lat. fiftieth), the Sunday immediately preceding Ash-Wednesday.

QUINQUE'NNIAL PRESCRIPTION, a period of five years allowed by the law of Scotland within which payment of sums on all bargains concerning movables, arrears of rent in some leases, multures, ministers' stipends, arrestments, must be enforced.

QUI'NQUEREMES, vessels with five banks of oars, however arranged (see TRIREME), may be regarded as the first-rates of the ancient navies. The Greek states used them after the death of Alexander, and the Carthaginians a little later. A Carthaginian vessel of this class served during the first Punic War as a model to the Romans, who built 100 on the coast of Bruttii in the year 256 B.C., and thenceforward maintained fleets of such ships. According to Polybius, a quinquereme carried 300 seamen and 120 soldiers.

QUI'NSY, or COMMON INFLAMMATORY SORE THROAT, known also as CYNANCHE TONSILLARIS and TONSILLITIS, is an inflammatory affection of the substance of the Tonsils (q. v.). The inflammation is, however, seldom limited to these glands, but extends to the uvula, the soft palate, the pharynx, and not unfrequently the salivary glands. The disease usually manifests itself by difficulty in swallowing, and a sense of heat and discomfort in the throat, often amounting to considerable pain. On examination, the throat at first exhibits a natural redness, with enlargement of one or both tonsils. The uvula is enlarged and elongated, its end either dragging down into the pharynx, and by exciting the irritation of a foreign body, giving rise to much irritation, or else adhering to one of the tonsils. The tongue is usually furred, and the pulse rapid, and these are the ordinary symptoms of that form of constitutional disturbance known as inflammatory fever. The inflammation terminates either in resolution if the attack is not severe, and yields readily to treatment, or in suppuration, which may be detected by the occurrence of slight rigors, and by the increased redness of the enlarged tonsil. The matter which is discharged has a very fetid smell, and the latter is often the first indication of the rupture. The pain almost entirely ceases with the discharge of matter, and recovery is then rapid. The disease is usually at its height in about a week after the manifestation of the first symptoms, and it almost invariably terminates favourably. The ordinary exciting cause of this disease is exposure to cold, especially when the body is warm and perspiring, and certain persons (or even families) are so subject to it that slight exposure is almost sure to bring it on.

The disease may sometimes be cut short if, at its very commencement, a sharp purgative (as, for example, compound infusion of senna with Epsom salts) be administered, followed up almost immediately by an emetic of a scruple of ipecacuanha with a grain of tartar emetic. The patient should remain in the house (or in cold weather, even in bed), and should be kept on low non-stimulating diet. A stimulating liniment, such as the compound camphor liniment, should be applied to the outside of the throat, and the neck should be surrounded with a piece of flannel. In mild cases, the above-detailed treatment is sufficient. In more severe cases, the patient may gargle frequently with hot water, or milk and water, or, which is better, may inhale the vapour of boiling water. Blistering and leeching will sometimes give relief, but if suppuration is once established, they do harm rather than good. If the tonsils are very much enlarged, they should be pricked with a lancet made expressly for the purpose.

Dr Trench, in his *English Past and Present*, gives quinsy (or quinsey, as he spells it) as an example of the gradual recasting of a foreign word into a new English mould. The Greek word *cynanche* was the origin of the French *esquinancie*, which caused the English language as *squinancy*, became *quinsy* in the time of Jeremy Taylor, and has now settled down to *quinsy* or *quinsey*.

QUI'NTAL, a French weight corresponding to the Eng. 'hundredweight,' was equal to 100 pounds (livres); on the introduction of the metrical system, the same name was employed to designate a weight of 100 kilogrammes (see GRAMME). The metrical quintal is thus more than twice as heavy as the old one, being equivalent to about 204½ livres.

QUINTANA, MANUEL JOSÉ, surnamed the 'Spanish Tyrtæus,' was born at Madrid, 11th April 1772, studied at Salamanca, and established himself as an advocate in his native city, where his house became a resort of the advanced liberals of the time. Among his earliest productions were his *Odes*, which gave him a place in the first rank of Spanish poets. On the outbreak of the War of Independence, he made good use of his lyric gift to stimulate the patriotism of his countrymen, and otherwise distinguished himself as editor of the *Semanario Patriótico*, and author of the manifestoes of the insurrectionary juntas, and of most of the

official statements of the first Cortes. Meanwhile, he did not abandon literature, properly so called. Besides his Spanish Plutarch (*Vidas de los Españoles Celebres*, Madr. 1807—1834), a work which is reckoned one of the finest Spanish classics, he published one or two tragedies, and an excellent selection of Castilian poetry (*Poesias Selectas Castillanas*, 3 vols. Madr. 1808). On the restoration of Ferdinand VII. in 1814, Q.'s liberalism caused his imprisonment for six years. On his release in 1820, he was received in Madrid with acclamations, and appointed President of Public Instruction. But his enthusiasm in the cause of liberty was now considerably quenched, and in its place appeared a spirit of subservience to royalty which greatly detracted from his previously patriotic character. In 1835 he was reappointed Director-general of Public Instruction, an office which he held till 1851. He was also made a peer and a senator, and acted as tutor to the young queen Isabella from 1840 to 1843. On the 25th of March 1855, Q. was honoured with a public ovation in Madrid, had a speech made to him by the Cortes, and a crown of golden laurel placed on his brows by the hand of Isabella herself. He died 11th March 1857. Q.'s works are to be found collected in the *Biblioteca de Autores Españoles* of Rivadeneyra (Madr. 1852).—See Kennedy's *Modern Poets of Spain*, and Ticknor's *History of Spanish Literature*.

QUINTE'SSENCE (Lat. *quinta*, fifth, *essentia*, essence) signifies literally the fifth essence. The word is of ancient origin, and dates from the time when it was generally believed that the simple elements or constituents of bodies were *four* in number, viz., fire, air, earth, and water, and that earth was the lowest element, being grosser than water, water than air, and air than fire. Some Pythagorean philosophers, not satisfied that these four elements or essences sufficed for the composition of all substances in nature, added to them a fifth element or essence, *ether*, which was supposed to be more subtle and pure than fire (the highest of the four), and was therefore located in the uppermost regions of the sky. The word 'quintessence' has thus come down to us in the signification of the most subtle ingredient or extract of any body, though in ordinary language it is employed in a figurative sense.

QUI'NTETT, a musical composition for five voices, or for five instruments, each of which is *obligato*. The most remarkable quintetts for stringed instruments are those of Boccherini, Mozart, Beethoven, and Onslow; and for wind instruments (the flute, oboe, clarionet, horn, and bassoon), those of Reicha.

QUINTI'LIAN (QUINTILIANUS, M. FABIUS) was born 40 A.D., at Calagurris (the modern Calahorra) in Spain, and attended in Rome the prelections of Domitius Afer, who died in 59. After this date, however, he revisited Spain, whence he returned in 68 to Rome, in the train of Galba, and began to practise as an advocate, in which capacity his reputation became considerable. He was more distinguished, however, as a teacher than as a practitioner of the oratorical art, and his instructions came to be the most eagerly sought after among all his contemporaries, while among his pupils he numbered Pliny the Younger and the two grandnephews of Domitian. As a mark of the emperor's favour, he was invested with the insignia and title of consul; while he also holds the distinction of being the first public teacher who benefited by the endowment of Vespasian, and received a fixed salary from the imperial exchequer. His professional career as a teacher of eloquence, commencing probably with 69, extended over a period of 20 years, after which he retired into private life, and died probably about 118. The reputation of Q. in modern times is based on his great work entitled *De Institutione Oratoria Libri XII.*, a complete system of rhetoric, which he dedicates to his friend Marcellus Victorius, himself a court favourite and orator of distinction. It was written (as he tells us in his preface to his bookseller Trypho) after he had ceased to be a public teacher; and was the fruit of two years' labour. During its composition, however, he was still acting, in the lifetime of Domitian, as tutor to the grand-nephews of that emperor. In the first book, he discusses the preliminary training through which a youth must pass before he can begin those studies which are requisite for the orator, and he gives us an elaborate outline of the mode in which children should be educated in the interval between the nursery and the final instructions of the grammarian. The second book treats of the first principles of rhetoric, and contains an inquiry into the essential nature of the art. The subjects of the five following books are invention and arrangement; while those of the eighth, ninth, tenth, and eleventh are composition (embracing the proper use of figures of speech) and delivery. The last, and, in the author's view, the most important, book is devoted to the various requisites for the formation of a finished orator, such as his manners, his moral character, his mode of undertaking, preparing, and conducting causes, the style of eloquence most advantageous to adopt, the age at which pleading should be begun, and at which it should be left off, and other allied topics. The entire work is remarkable for its sound critical judgments, its purity of taste, and the perfect familiarity it exhibits with the literature of oratory. The condensed survey of Greek and Roman literature with which the tenth book commences, has always been admired for its correctness and animation. The declamations, amounting to 164, which have been ascribed to him, are now believed to be spurious, as they evidently belong to different authors, and even different epochs. There is better ground, however, for ascribing to him the anonymous *Dialogus de Oratoribus*, often included in editions of Tacitus. The best editions of Q. are those of Burmann (Leyden, 1720); and of Spalding and Zumpt (Leip. 1798—1829).

QUINTIN MATSYS, a celebrated painter of the early Flemish school. He was born at Antwerp about 1460, and is generally known by the name of the Blacksmith of Antwerp, from having followed that trade in early life. The romantic story so long connected with this artist's name, of his having adopted the profession of painting in order to obtain the hand of a painter's daughter, is founded on nothing more authentic than the verses of Lampsonius, affixed to his portrait by Jerome Cock (1510—1570), and the inscription on his monument in the cathedral at Antwerp, 'Connubialis Amor de Mulcibere fecit Apellem.' The fact of his admission into the painters' fraternity of St Luke in 1491—1492, is proved by an entry in the register of that body. It appears from two authentic documents that he was alive on 8th July 1530, but had died previous to 12th October 1531. In the works of this distinguished painter, art is exhibited as transitionary between the style of Van Eyck and Rubens—his aim being, without neglecting the accessory details, to give more importance to the human figure, and more unity and effect to the general composition of his picture. Albert Dürer and Holbein thought highly of his works; among them, the best is an altar-piece with two folding-doors or wings, at one time in the cathedral, now in the Picture-gallery at Antwerp, and one of the *chefs-d'œuvre* of that

collection. It is specially referred to by Sir Joshua Reynolds in his Notes on his Tour through Flanders and Holland. Q. M. was on intimate terms with Erasmus, Sir Thomas More, and Petrus Egidius. Many elaborate specimens of ornamental iron work are attributed to this artist; but from the facts connected with his career as a painter, it may be inferred that he merely furnished designs for the works in iron referred to.

QUI'NTIN, or QUINTAINE, was an instrument used in the ancient practice of tilting on horseback with the lance. It consisted of an upright post,

Ancient Quintin at Offham, Kent.

surmounted by a cross-bar turning on a pivot, which had at one end a flat board, at the other a bag of sand. The object of the tilter was to strike the board at such speed that the rider was past before the bag of sand, as it whirled round, could hit him on the back.

QUI'NTUPLET, in Music, a rhythmical group of five notes, formed of a note divided into five instead of its proper complement of four parts; the five notes having collectively the value usually expressed by four such notes. Thus, the five semi-

quavers of the group  are

equivalent in value to one crotchet, or four ordinary semiquavers.

QUI'NTUS CU'RTIUS RU'FUS, the Roman historian, flourished probably in the time of Vespasian; while a less plausible conjecture represents him as having lived in the reign of Constantine. Nothing further is known, or can even be fairly surmised regarding his life. His work entitled *De Rebus Gestis Alexandri Magni Regis Macedonum*, consisted of ten books; but of these the first two are lost, and the other eight are occasionally imperfect. Its style is flowing and ornate, but it wants the pure Latinity of Cicero, and the simplicity of Cæsar. Along with the Greek history of Arrian, it forms our most valuable source of information respecting the military career of Alexander the Great, although it is not entirely free from geographical, mythological, and strategical blunders. The best edition is that of Zumpt (Brunswick, 1849).

QUIRE (*fr. cahier*), of paper, a collate of twenty-four sheets, each doubled once, and one placed within the other.

QUIRI'NUS was, among the Sabines (and according to Mommsen among the Latins also), a surname of Mars, and is probably derived from the Latin word *quiris*, a spear. It is therefore equivalent to the 'Spear bearer.' According to the ancient legend, the name was first given to Romulus (q. v.), as the son of Mars, after his apotheosis, and the festival instituted in his honour was called the *Quirinalia*.—The QUIRINAL (Lat. *Collis Quirinalis*), is one of the seven hills on which ancient Rome stood, and, next to the Palatine and Capitoline, the oldest and most famous quarter of the city. It lies due north of the Palatine, and its western slope looks down on the Campus Martius, which stretches from its base to the banks of the Tiber. According to the ancient legend, it was the seat of the Sabine portion of the mixed population of early Rome; but this idea is strongly combated by Mommsen, who rejects as a 'baseless speculation' the 'etymologico-historical hypothesis started by Varro, and, as usual, unanimously echoed by Latin writers, that the Latin *quiris* and *Quirites* are akin to the Sabine town *Cures*, and that the Quirinal Hill accordingly had been peopled from Cures (*History of Rome*, vol. i.). The most notable structures on the Quirinal were *The Temple of Quirinus*, said to have been built by Numa in honour of Romulus, *The Temples of Flora, Salus, Fortuna, and Sol*. Here, also, were the famous Gardens of Sallust (*Horti Sallustiani*), the *Circus Flora*, the *Circus Sallustii*, the Baths of Diocletian, and the Prætorian Camp.

Quirk.

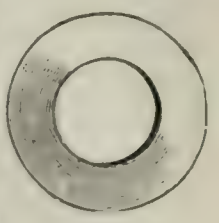
QUIRK, a small angle or recess between mouldings as at *q*. It is much used in Greek and Gothic architecture, and sometimes in Roman.

QUISCALUS, a genus of birds of the family *Icteridæ*, having the tail longer than in the true nests (*Icterus*), and *graduated*—the middle feathers longest—its sides turned up. From this last character, some of the species are often called Boat-tail. The Great Boat-tail, or Great Crow Blackbird (*Q. major*), a bird about 16 or 17 inches long, is common in the southern parts of North America. More common, and indeed abundant in all parts of the United States, is the Purple Grakle, or Crow Blackbird (*Q. versicolor*), a bird about twelve inches in length, tail included; black, with reflections of blue, violet, &c. Vast flocks of this species are to be seen at the seasons of migration in some parts of North America. Its migrations extend to very northern regions in summer. It is to be found in Louisiana at all seasons. Its depredations in fields of maize and other kinds of grain, make it an object of especial dislike to North American farmers. Its flesh is dry and coarse, although often used for food; but its eggs are esteemed a delicacy.

QUITCH. See Couch Grass.

QUI TAM actions are actions so called in the law of England from the first words of the old form of declaration by which informers sue for penalties, the plaintiff describing himself as suing as well for the crown as for himself, the penalty being divided between himself and the crown.

QUI'TO, the capital of Ecuador (q. v.), and of a province of the same name, stands between two parallel ranges of the Andes, on the east side of the volcano of Pichincha (q. v.), at an elevation of 9492 feet above the sea, and in lat. 0° 15′ S., long. 78° 45′ W. Its site, in the midst of mountains, is very uneven; its appearance, however, is picturesque, and its beautiful environment of mountains, together with its clear, healthy, and temperate climate, averaging 60° Fahr., and described as an eternal spring, make it one of the most charming cities of South America. From the hills in the vicinity, a beautiful panoramic view, embracing eight icy peaks of the Andes, may be obtained; and to the south of the city extends the lovely valley of Chillo, laid out in gardens. The chief edifices are built of stone, the others of adobes, or sun-dried bricks, covered with tiles. Q. contains many churches, monasteries, convents, two hospitals, two colleges, and several plazas or squares. By the earthquake of March 1859, most of the then existing churches, convents, and government buildings, as well as many private residences, were thrown down, property to the value of 3,000,000 dollars was destroyed, and many lives lost. From this calamity, the city has in great part recovered. Q. is the seat of the only archbishop in the country, and of the government. Coarse cotton and woollen goods and jewellery are manufactured, and the trade in grain, indigo, metals, and liquors is extensive. Pop. 80,000.



The most important events in the history of Q. are mentioned in the articles ECUADOR and PERU (q. v.).

QUIT RENT is the small rent which is payable by the tenants of old manors, by which they go *quiet* and free. In old records, it is called *white* rent, because it was paid in silver money, as distinguished from corn rents.

QUOIN (Fr. *coigne*, from Lat. *cuneus* = Gr. *gonia*) is generally a wedge or an angle. In artillery, the quoin is a wedge inserted beneath the breech of a gun, for raising or depressing the muzzle. The Armstrong gun is elevated by a screw instead of a quoin; but considering the rough service of actual warfare, it is doubtful whether the clumsier quoin is not more to be depended on. Quoins on shipboard are wedges used to prevent casks from damaging each other.

QUOIN, in Architecture, is one of the stones forming the solid corner of a building. Where the work is of brick or small materials, the quoins are usually of ashlar. They sometimes project, and are moulded, when they are called 'Rustic Quoins.' See RUSTICATION.

QUOITS, a game much practised by the working classes in the mining districts of Great Britain, seems to have been derived from the ancient game of 'throwing the *discus*,' which was such a favourite amusement of the Greeks and Romans. The discus was a circular plate of stone or metal, 10—12 inches in diameter, and was held by its further edge with the right hand, so as to lean upon the fore-arm, and was cast with a swing of the arm, aided by a twist of the whole body. It was generally thrown edge foremost, and upwards at an angle of 45°, so as to give it as great a range as possible, and the player who threw it furthest was the winner. Similar to this game was the 'throwing of the *solos*,' a heavy spherical mass of stone or iron, perforated through the centre, to admit a rope or thong, by the aid of which it was thrown. In this game also, the furthest throw was the successful one. It is still practised by the mountaineers of the Appenzell, in Switzerland. The game of quoits differs very considerably from both of these. A quoit is a flattish ring of iron, generally from 5 to 6 inches in external diameter, and between 1 and 2 inches in breadth. It is convex on the upper side, and slightly concave on the under, so that the outer edge curves downwards, and is sharp enough to stick into the ground.

Quoit.

The mode of playing is as follows: Two pins, called 'hobs,' are driven into the ground from 18 to 24 yards apart; and the players, who are divided into two parties, stand at one hob, and in regular succession throw their quoits (of which each player has two) as near to the other hob as they can. The points are counted as in bowls or in curling. To facilitate the sticking of the quoits at the point where they strike the ground, a 'clay end'—that is, a flat circle of clay, about 1 or 2 inches in thickness, and 1½ feet in radius—is placed round each hob. This requires to be kept moist, and should have sawdust strewed over it. The quoit, when to be thrown, is grasped with the right hand by one side, and pitched with an upward and forward jerk of the hand and arm, which give it a whirling motion, and cause it to strike the ground with its edge. Professional players acquire such dexterity in this game, that they can very frequently 'ring' their quoit—that is, land it so that the quoit surrounds the hob.

Hob.

QUO'RRA. See NIGER.

QUO'RUM (Lat. *quorum*, of whom) is a legal term, denoting a certain specified number out of a larger number as entitled or bound to act for certain purposes. Thus, in statutes appointing commissioners or trustees of a public work, it was usual to name a certain number of the whole body as sufficient to discharge the business, when it may be inconvenient for all to attend. In Scotland, the word is commonly used in reference to trustees appointed under trust settlements, when one or two individuals, either in point of number, or for some personal reason, must concur in formal acts. In England, the word is now seldom used except in regard to justices of the peace. It was an ancient practice of the crown to select a few of the justices, generally the most skilled in the law, and designate them as 'of the quorum,' so as to secure their presence on certain occasions when peculiar business requiring skill was to be done. This selection, however, by degrees came to be considered invidious; and by statutes of George II. and George III., it was expressly enacted that things which formerly required to be done only by justices of the quorum, might be done by ordinary justices. And latterly, the crown has made all the justices justices of the quorum, so as to put them all on the same footing.

QUOTI'DIAN FEVER. See AGUE.

QUO' WA'RRANTO is a writ or information issued from the Court of Queen's Bench in Westminster, calling upon a person or body of persons to shew by what warrant they exercise a public office or privilege. It is the legal mode of remedying any usurpation of privilege or of office.

R

THE eighteenth letter in the English and other Western alphabets, is one of the group of liquids. See LETTERS. Its name in Hebrew was Resh, meaning forehead, and the rude outline of a head is thought to be yet recognisable in the Phœnician form of the letter. Of all the consonants, R approaches most nearly to the vowels. In Sanscrit, there is an R-vowel, distinguished from the R-consonant by a different character. The Greek also had two varieties of R, one with the 'spiritus asper' (ῥ), or rough breathing, at the beginning of words, and when following another R; and another with the weaker breathing (ρ) in other positions. The Romans in spelling Greek words represented the former by *rh*, and hence we still write *Rhodes*, *rheumatism*, *catarrh*. This *rh* was probably of the guttural kind commonly called a 'burr.' This pronunciation of *r* occurs as a peculiarity of individuals everywhere, but it is universal in Northumberland and Durham, and characterises the pronunciation of the letter in certain positions throughout Germany and Scandinavia. The normal pronunciation of R in English and in the Romanic tongues (and it appears to have been the same in Latin) is a vibratory sound produced by applying the tip of the tongue near the roots of the upper fore-teeth. From the resemblance to the growl of an angry dog, R was called by the ancients the dog's letter. In modern English, there is an increasing tendency to smooth down the roughness of the vibration, until, in such words as *far*, *serf*, *world*, the *r* has dwindled to a kind of nondescript vowel, modifying the preceding vowel. This emasculating process—for such it undoubtedly is—is in so far only the operation of the universal law of phonetic decay, arising from the natural tendency to spend as little energy as possible; but it has been accelerated in this case by a fashion which is apt to mistake languor and indifference for refinement. This affectation goes so far as to turn words like *very*, *rare*, into *vewy*, *waaw*. R is one of the most difficult articulations; children are long in learning it, and some individuals never can pronounce it. Whole nations (e. g., the Chinese and some Polynesian tribes) have no such consonant in their language, using *l* instead. The interchanges of *r* with *l* are noticed under L. A more remarkable substitution is that of *r* for *d*, which was very prevalent in early Latin, as we learn from Priscian and from inscriptions. Ex. *arvocatos* for *advocatos*. The Latin of the literary period had returned from this corruption, except in *arbiter* (from an old verb, *adbitere*, to go to, to intervene), *arcesso*, and *meridies* (for *medidies*, from *medius*). The substitution is easily accounted for, when we consider that in both sounds the tongue is applied to the same part of the palate; only in the one it is applied firmly; in the other, loosely, so as to vibrate.

A very common phenomenon, especially in Latin, is the sinking or degradation of an original *s* between two vowels into *r*. On inscriptions we find *Lases*, *mos*, *eius* for what at a later period was written *Lares*, *mos*, *eius*. *Jus* was changed in the genitive *juris*, *mos* instead of *jous*, *eius*. Even final *s* was sometimes degraded to *r*, as in the double forms, *arbos* or *arbor*, *honos* or *honor*. Curiously, we know the date when the tendency to change *s* between two vowels into *r* set in, for Cicero remarks that L. Papirius Cursor, who was consul 336 B.C., was the first that was called Papirius, the ancestral name having been Papisius. The interchange in question occurs also to some extent in the Teutonic tongues. Compare Eng. *forlorn* with *lose* (Ger. *verlieren*), *was* with *were*, Ger. *wesen* (to be) with *war* (was), Goth. *hausjan* with Ger. *hören* (to hear); Eng. *hare* with Ger. *hase*. The unstable nature of this consonant is manifested in its frequently changing its place with regard to an adjoining vowel; compare *bread* with *broad*; *bird* with old *brid*; *grass* with A.-S. *gærs*.

RA. See EGYPT.

RAAB (Hung. *Győr*), a town of Hungary, stands on a marshy plain at the confluence of the Raab and the Little Danube, a branch of the great river of that name, 67 miles west-north-west of Buda. It consists of an inner and outer town—the former well defended—is well built, but suffers from an insufficient supply of drinking water. It contains numerous religious edifices, among which is a beautiful cathedral. The manufactures are chiefly tobacco and cutlery; and the trade of the town, favoured by its position on the highway between Vienna and Buda, is important both by land and by steamers on the river. Pop. 20,252.

RAALTE, a cantonal town of the Netherlands, in the province of Overyssel, 11 miles north-north-east of Deventer. Pop. 5570, of whom one-fourth belong to the Reformed Church, and the remainder, excepting 50 Jews, to the Roman Catholics. The trade is chiefly in agricultural produce, cattle, wool, wood, and bark for tanning. R. is one of the prettiest places in the province, having many beautiful houses, and in the neighbourhood, seats of the nobility. Hans Willem, Baron van Bentinck, the founder of the ducal house of Portland, was born at R. in 1651.

RAASAY, one of the Western Isles, belongs to the group of the Inner Hebrides, and lies between the Isle of Skye and the mainland; the sound of Raasay separating it from the former, and Applecross Sound from the latter. It is 13 miles in length by 2½ miles in greatest breadth. Pop., which is gradually decreasing, was, in 1861, 388. The western side of the island is bare and uninteresting. On the eastern and more sheltered side, there are numerous farms, some patches of plantation, and bold and striking scenery. Brochel Castle, on the east shore—now a mere ruin—is the chief object of interest in the island. It is perched on the summit of a lofty cliff, which beetles over the sea,

and is entirely inaccessible, save by a pathway winding around the cliff.

RABA'T, or RABATT, a seaport and manufacturing town in the kingdom of Fez, Morocco, stands at the mouth of the Bu-Regreb, 135 miles south-south-west of the entrance to the Strait of Gibraltar. It is surrounded by walls; protected by batteries, and by a citadel, called *El-Mansur*; and contains numerous mosques, minarets, bazaars, &c. Owing to the silting up of the mouth of the river, the commerce of R. has much declined. Manufactures, however, of carpets, bournus, woollen fabrics, waterproofs, mixed linen and silk goods, saddlery, &c., are actively carried on. R. was formerly the centre of the European trade with Morocco, and it still exports olive oil, wool, almonds, wax, maize, &c. In 1863, 85 vessels, of 7170 tons, entered and cleared the port. Pop. 28,000, of whom 7000 are Jews.

RA'BBA, a flourishing town of Africa, in the kingdom of Gando, stands on the left bank of the Niger, 80 miles above Egga, in lat. 9° 16′. The district by which it is surrounded is beautiful and highly cultivated. R. carries on an extensive general trade; is the most notorious slave-market in this part of Africa, and is said to contain 40,000 inhabitants.

RA'BBI (Heb., *My Master*), an honorary title of the Jewish Masters of the Law, which is first found applied after the time of Herod, subsequently to the disputes between the two schools of Shammai (q. v.) and Hillel (q. v.). It was in common use at the time of Christ, who is addressed as such by his disciples and the common people. Other forms of the same title are Rab, Rabban, Rabbon, ('Rabbuni')—the first, like rabbi, being more a general term for a certain recognised authority, the latter applying more strictly to a head of an academy. The title Rabban, was first given to the grandson of Hillel, Gamaliel (q. v.), and was only borne by seven other exalted chiefs of schools. Properly speaking, the following dignities alone were of old considered 'official:' 1. *Sopher*, scribe, one who occupied himself with copying and commenting on the Scriptures, and who, when elected to the Sanhedrim (q. v.), received the title of Chacham (Sage); 2. *Rabban*, Nomodidaskalos, one who held popular orations, homiletically or otherwise treating of the Law. Out of the number of the regular disciples (Talmidim) were chosen the Chaberim (Colleagues), who, again, were elected to the dignity of a rabbi by the 'Semichah,' or imposition of hands by three members of the Sanhedrim. At present, nothing but the degree of 'Morenu,' our Teacher, bestowed upon a candidate who proves his erudition in the written and oral Law and all its bearings before a college of rabbis, is wanted to render him eligible for the post of a rabbi, which, however, carries no authority whatsoever with it, save on a very few ritual points. We need hardly allude to the popular fallacy of the rabbi of our day being a kind of 'priest' in the sense of the Old Testament. He is simply the teacher of the young, delivers sermons, assists at marriages and divorces, and the like, and has to decide on some ritual questions. Up to the times of the removal of the 'Disabilities' in Europe, he had on some occasions also to give judgment in civil matters, in accordance with the 'Choshen Mishpat,' a legal text-book, derived from the Talmudical and post-talmudical authoritative decisions.

RABBIT (*Lepus cuniculus*), an animal of the same genus with the hare, but of smaller size, and with shorter limbs, the hind-legs shorter in proportion. It is not adapted, like hares, to seek safety by rapid and continuous running, but by retreating to burrows, which it excavates with great dexterity. Except in some varieties, which result from domestication, the ears are only about as long as the head. The wild R. is of a grayish-brown colour, paler or whitish on the under parts; the ears not tipped with black, like those of the common hare; the tail rather larger and more conspicuous—brown above, white beneath. The R. exhibits a remarkable difference from the hare in its gregarious habits; and another in the comparatively imperfect state of the young at their birth, which are blind for

Tame Rabbits.

some days, and are almost destitute of hair. It delights in sandy heaths, dry grounds covered with scattered furze or juniper, and other such situations; to which, however, it is by no means restricted, and is often very troublesome by its depredations on crops in the finest fields, having its abode in some neighbouring wood, but it never makes its burrow in a wet soil. Although now very abundant in most parts of Britain, and generally throughout Europe, the R. is said to have been introduced into Britain from Spain, and even to have been originally brought to Europe from the north of Africa. In a wild state, the R. is monogamous, and the attachment of a pair is said to continue during life; but in a state of domestication, it ceases to pair. The fertility of rabbits is proverbial; they begin to breed when six months old, and are capable of producing several litters in a year, of 4 to 12 or more in a litter; so that, in favourable circumstances, they multiply with prodigious rapidity; and although they have many natural enemies, would in many places become an intolerable pest to farmers, were not means adopted to reduce their numbers. Rabbits often inflict great injury on plantations by barking young trees, seeming to take pleasure in tearing off far more than they can eat. An infusion of tobacco repels them from trees. The flesh of rabbits is in high esteem, and the fur being used for various purposes, rabbit-warrens are found profitable in lands not suited for agriculture. See RABBIT-SKINS.

Instances have occurred of the R. and hare breeding together, but they are very rare, and the creatures seem rather to regard one another with antipathy.

Tame rabbits exhibit great varieties of colour—gray, brown, reddish-black, more or less mixed with white, and often white with all the characters of albinism. Peculiarities of other kinds also appear in some of the varieties, among which excessively long and drooping ears are one of the most remarkable. *Fancy rabbits* are prized and tended like *fancy pigeons*. But when rabbits are kept for economical purposes, those which differ less widely

from the original type are preferred. Rabbits eat almost any kind of vegetable food; the coarser blades of cabbages, turnip leaves, celery tops, carrot tops, and other produce of the garden, not suitable for human use, are readily consumed by them, as well as chick-weed, sow-thistle, dandelion, and many other weeds. With very little trouble, and still less expense, a man can easily secure one or two rabbits a week for his family from the produce of his stock. When the rabbit-enclosure contains a plot of grass and clover, it affords them an important part of their food. Great care is requisite to keep their boxes dry, neglect of which, and a too exclusive feeding with green and succulent food, cause diseases, often fatal, particularly to the young. Dry food, such as corn, ought to be frequently given; and aromatic herbs such as parsley, thyme, milfoil, &c.—not only tend to preserve the health of rabbits, but to improve the flavour of their flesh. It is usual to give no water to tame rabbits; but it is better to supply them regularly with it, and the females particularly need it after producing young.

The *Angora R.* is a remarkable variety, with very long silky hair, which is easily stripped off in summer, and is of considerable value. The rearing of this kind of R. is extensively practised in some parts of France, in order to the manufacture of gloves, &c.

An old English name for the R. is *cony*, and its name in many other languages is similar to this, as Lat. *cuniculus*, Ital. *coniglio*, Ger. *Kaninchen*, Welsh *Cwningen*; but the R. is not the Cony (q. v.) of Scripture.

The Gray R. (*Lepus sylvaticus*) of North America is the most plentiful species of the genus *Lepus* in New Jersey, Pennsylvania, and the more southern states; but although it somewhat resembles the common R. in colour, and is rather inferior to it in size, its habits are intermediate between those of the R. and of the hare. It does not burrow, although, when hard pressed by a pursuer, it retreats into any accessible hole, and sometimes digs, in order to escape from or enter an enclosure.

Zoologically, rabbits belong to the family *Leporidæ*, of the order *Rodentia*. The greater number belong to the genus *Lepus* (Linnæus), while a few are referable to *Lagomys*, or the *Pikas*. The family was represented in the Miocene period of North America by the genus *Palæolagus* (Leidy), and in the Postpliocene by *Praotherium* (Cope). The recent *L. sylvaticus* also occurs in the latter formation in America. Species of *Lepus* are abundant in Africa and Western Asia, but North America possesses more species than either. There are but few in South America, and none in Australia. Baird divides the American species into five sections, dependent on the degree of separation of the post-orbital processes from the side of the temporal region. In one extreme they diverge widely from the cranium, in the other they are in close contact, with the distinguishing suture obliterated. To the last belong *L. aquaticus* and *L. palustris*, large-headed species from the swamps of the low countries of the Southern states; to the first, the Arctic hare (*L. glacialis*), the changing hare (*L. americanus*), and the Oregon hare (*L. washingtonii*), of the higher northern regions. Several species (*L. campestris*, *L. callotis*, *L. artemisia*) inhabit the plains west of the Mississippi River; the *L. callotis* is well known to pioneers in Texas and New Mexico as the Jackass Rabbit. As is the case with grouse, the northern hares assume a white pelage in winter, and a brown one in summer, the southern species retaining the brown colour throughout the year.

RABBITS, in point of English law, give rise to many nice questions, which in practical life are of no small importance, for they form a branch of the Game Laws (q. v.). In England and Ireland, whoever is owner of the soil is entitled to catch and kill all the rabbits he finds upon it, without any game licence; but if he is not the owner or tenant of the lands, or acting by their express direction or permission, then he must have a licence. As between landlord and tenant, the rule is that unless the lease expressly says that the rabbits shall belong to the landlord, they belong to the tenant, who can kill and catch them at discretion. A tenant, however, though having a right to kill rabbits on his farm, cannot give leave to strangers to come on his farm and enjoy a day's sport there, though rabbits, but rabbits only, are killed, the privilege of killing the rabbits being personal to the tenant. Nevertheless, the tenant may employ the servant of a rabbit-catcher to kill the rabbits if they exist in excessive quantities, for in that case he deals with them as vermin. See also GAME, POACHING. Pascoe's *Game laws of the United Kingdom*.

RABBIT-SKINS have a regular commercial value in consequence of the hair being well adapted for felting purposes; hence they are collected in large numbers by the chiffoniers of this and other countries; and the hair itself is not unfrequently imported from Holland and Germany under the erroneous name of 'coney-wool.' Its chief use is in making the bodies of felt hats; and this is now done by machinery of very ingenious construction. It consists of a hollow cone of copper, of the size of the felt cones required by the hatters. The cone is covered with perforations, and it fits on to a metal shaft of the diameter of its base, by means of a collar, which can be turned round by a band, so as to carry the perforated cone with it. At the bottom of the metal shaft is a fan, moved by machinery, which produces a strong downward draft, so that if the hairs are thrown against the cone, they are held tightly by the current of air through the perforations; and as the cone regularly revolves, its outer surface becomes entirely coated with the rabbit-hair. When a sufficient thickness is obtained, the smooth copper cone is easily drawn out, leaving a cone of wool, which is felted by the usual processes of wetting, beating, &c. Another ingenious contrivance in this machine is to make the draft of air caused by the fan blow the rabbit-fur forward to the cone, so as to distribute it with an evenness which could not otherwise be attained.

The skins, after the hair has been removed from them, are sold to the glue makers, and are used—mixed with shreds of other skins—in the manufacture of glue and size. Besides these uses, the skins of rabbits are dressed as furs, in various ways, to supply the demand for cheap articles; and so skilfully is this branch of trade carried on, that admirable imitations of the rarer and more costly furs are made. Thus, ermine and miniver are made from white rabbit-skins, the black ones furnishing the spots; and the common variety is dressed and dyed various ways, to represent the furs of dark-coloured animals. In the reign of Henry VIII., rabbit-fur was valued very highly, and was worn by the nobles of the realm; this is referred to in the charter of the Skinners' Company.

There has been a very large market in the United States for the imitation furs prepared from rabbit-skins, to which country British manufacturers have largely exported.

RABELAIS, FRANÇOIS, the greatest of French humorists, was born, according to the general statement of biographers, in 1483, but more probably towards 1495, at Chinon, a small town in Touraine. His father, Thomas Rabelais, was proprietor of a

farm in the neighbourhood, celebrated for the quality of its wine, the sale of which he perhaps combined with the business of an apothecary. His prosperous circumstances enabled him to give to his son every advantage of education, and at an early age, the boy was sent as a pupil to the neighbouring Abbey of Seully. His progress in his studies being found by no means satisfactory, he was thence removed to the university of Angers. Here—though as a scholar he still remained quite undistinguished—he was fortunate enough to make the acquaintance of Jean (afterwards the celebrated Cardinal) Du Bellay, to whose steady and helpful friendship he was subsequently much indebted. At the desire of his father he consented to embrace the monastic state, and after passing through the preliminary novitiate, became a brother of the order of St Francis, in the convent of Fontenay le Comte, according to the annalist, Pierre de St Romuald, in 1511, but the discovery of a document by M. B. Fillon (*Poitou et Vendée*, Fontenay, 1861), renders the date 1519 more probable. R. now devoted himself with the utmost ardour and perseverance to the prosecution of his hitherto neglected studies. Aiming at the widest culture attainable, he ranged the whole circle of the sciences as then understood. To medicine, in particular, he seems to have been strongly attracted; and in the sphere of language, in addition to Latin and Greek, he is said to have attained a competent mastery of Italian, Spanish, German, English, Hebrew, and Arabic. Meantime, with his brother-monks, he was much the reverse of a favourite. They hated him for his devotion to the new learning, and suspected his Greek to be only a cover for heresy. About 1523, a search was made in his cell for suspicious books; the whole were confiscated, and to save himself from further and sharper persecution he fled. But though only a poor monk, the wit and learning of R. had gained him several influential friends, through whose exertions he obtained from Pope Clement VII. an indulgence to transfer himself from the order of St Francis to that of St Benedict, and became an inmate of the monastery of Maillezais. For the calumny afterwards circulated, that his removal was necessitated by the odium attached to a life of profligate indulgence, there seems no reason to suppose that there ever was the smallest ground. We must infer that in his new abode he found himself not much more comfortable than before, as after a few years he quitted it abruptly, without the sanction of his ecclesiastical superiors, thereby incurring the severest censures of the church. But it was not persecution that induced this second flight from the monastic state. It was the incurable aversion of the grotesque humorist to the restraints of the 'regular' clergy. And nobody seems to have really blamed him for his professional apostacy—his own bishop, among others, receiving him at his table in the most friendly manner! During 1524—1530 he appears to have frequented the universities of Paris and Bourg; which may account for the intimate knowledge of university manners and opinions shewn in his great work. In the year 1530, he settled himself at Montpellier, and taking a medical degree at the university, was appointed to the post of lecturer. In 1532 he went as hospital physician to Lyon, where he published several works on medical science, besides other miscellaneous matter bearing on archæology, jurisprudence, &c. In the beginning of 1534, his old friend, Jean Du Bellay, then Bishop of Paris, and shortly after to be Cardinal, passed through Lyon, on an embassy to Rome, whither, in the capacity of travelling physician, R. was delighted to accompany him, in fulfilment of a desire long cherished. While at Rome, he petitioned Paul III. for a remission of the penalties still attached to his misdemeanour before mentioned; and through the interest of Du Bellay and others, a bull was obtained, absolving him, and permitting his return to the order of St Benedict. But he continued the exercise of his profession of medicine at Montpellier and other towns till 1538, when he withdrew as canon into Du Bellay's own abbey of St Maur des Fosses, near Paris, and resumed his monastic habit. The death of Francis I. in 1547, was followed by the fall of Cardinal du Bellay, the new monarch, Henry II., favouring the Cardinal de Lorraine. R. shared for a time in the disgrace of his old protector, whom he appears to have followed to Rome, but his tact and irresistible humour won him friends among the Lorraines, and in 1551 he obtained the curacy of Meudon, in the occupancy of which the remainder of his life was passed. So far as record remains of it, his life here was happy and blameless. He was exemplary in the fulfilment of duty, profuse of charity, sedulous in the relief of suffering, for which his medical knowledge afforded him unusual facilities; and always specially delighted to cultivate, as occasion served, the society of those any way noted as eminent in learning or science. He died at Paris, in 1553, in the Rue des Jardins, in the parish of St Paul, in the cemetery of which he was buried.

The scientific treatises of R. are—almost in the nature of the case—long since utterly forgotten; but his romance, in which are narrated the wonderful adventures of Garagantua and Pantagruel, continues to take rank as one of the world's masterpieces of humour and grotesque invention. In the form of a sportive and extravagant fiction, it is, in fact, a satirical criticism of the corrupt society of the period, the prevalent follies and vices of which are parodied with surprising effect and ingenuity. The difficulty of its allegorical form, however, and the quantity of recondite allusion it embodies, tend somewhat to impair the effect of the work for most modern readers. Also, it must be said, that in his attempt to

> Cleanse the foul body of the infected world,

it is the whim of the writer to infect himself with not a little of its foulness; and such is the riotous licence of the buffoonery, from behind which, as a stalking-horse, he shoots the arrows of his wit, that few books are less fitted for general perusal in the present more decorous times. On the publication of his work, the charge of irreligion and atheism was freely preferred against R., and certain other scandals were circulated, for which there seems to have been in his life no foundation, except as the free tone assumed by the writer might suggest a precarious inference to defective morality in the man. The religious corruptions of the time, and the vices of the priestly class, had formed one favourite theme of his satire, and he simply paid the usual penalty in thus incurring the easy retort calumnious. See Delécluze, *François Rabelais* (Par. 1841), and P. Lacroix, *Rabelais sa Vie et ses Ouvrages* (Par. 1859), in the latter of which works the incidents of his career are for the first time clearly and correctly narrated.

RA'BIES, the name given to a disease affecting the dog and other animals, was known to the ancients, and is spoken of by Aristotle, Pliny, and Horace; but it does not seem to have been then so virulent in its nature, or alarming in its consequences, and Aristotle, perhaps in ignorance, states that man was not subject to its attacks. It was very prevalent on the continent two or three

centuries ago, but was comparatively rare in this country until the last century. This malady stands almost alone in this, that all animals seem liable to its attacks.

It is a matter of dispute among some of our best authorities whether rabies be occasionally *spontaneous* in the carnivora—the only animals in which it is undoubtedly inherent—or communicated solely by *inoculation*.

Looking simply at the *history* of the disease, the facts would seem to be against the spontaneity theory. Rabies is not known in some countries, such as the Cape of Good Hope, South Africa, Egypt, Syria, the South Sea Islands, Lisbon, where dogs swarm; and in Constantinople, where they go at large, and support themselves on offals of all kinds and qualities, the disease is of very rare occurrence. John Hunter relates that it was not known in Jamaica for forty years previous to 1783, when it was introduced by an affected dog from America; and Dr Hamilton says that curs of the most wretched description abound in the island of Madeira—that they are affected with almost every disease, tormented by flies, by heat, thirst, and famine, yet no rabid dog was ever seen there. There is often, no doubt, great difficulty in tracing the cause of rabies from inoculation. The owner may feel convinced that his diseased dog had almost never been out of his sight, or exposed to an affected animal; but when we consider the predatory habits of the dog, and his love of association, and how easily he can steal away unobserved by night or by day for a longer or shorter time, we can readily account for the most vigilant eye being occasionally off its guard. It has been asked, as an objection to the exclusiveness of contagion or inoculation, How was rabies at first originated? But the same difficulty attends the case of small-pox and other diseases which now arise only from contagion.

There is another important peculiarity in this disease on which medical men are divided—viz., whether the virus of a rabid animal, other than of the *carnivorous* species, can communicate the disease. Experiments to test this were made by some foreign surgeons of eminence, by Drs Vaughan and Babington of London, and at the Royal Veterinary College; and it is reported that in every instance they failed in producing the disease. It is certain, however, that others have not so failed in their object. MM. Majendie and Brechet in 1823 inoculated two dogs with the saliva of a hydrophobic man, and it resulted in one of the dogs becoming rabid, which in turn communicated the disease to other dogs and some sheep. Mr Earl, the well-known London surgeon, in administering medicine to a hydrophobic woman, was bitten by her, and he immediately excised the bitten part. Being accused of unnecessary fear and cowardice, he determined to justify his fears, and having inoculated several rabbits with the woman's saliva, some of them became rabid. Mr King of Bath succeeded in producing the disease in a common hen by the virus of a cow. Several other cases could be related, but it may serve our purpose to quote the following remarks of Mr Youatt: 'I can imagine that the disease shall not be readily communicated by the saliva of a graminivorous animal; but I have once produced it in the dog with the saliva of an ox, and twice with that of the horse, but I have failed to do it in very many cases. While on this point, it may be remarked, that the writer once saw a rabid horse bite a young man's hand rather severely, while incautiously giving it a ball of medicine, and he accompanied him to Sir Astley Cooper, who, according to his invariable practice, as he told us, applied nitrous acid to the injured part, and he assured us that no bad effects would accrue, and neither there did.'

We shall briefly notice some of the leading symptoms of rabies in the dog and horse. These may be exhibited in the dog in a few days, or it may be, and often is, weeks, and even months after he has been bitten. At first he loses his appetite, becomes sullen, fidgety, has a violent pain, itch or pricking in the injured part, laps any liquid that comes in his way—for he has, unlike man, no dislike to water, although he has a difficulty in swallowing it—eats wood, straw, hair, and other indigestible substances, and in a day or two he becomes quarrelsome, bent on mischief, bites at anything that comes in his way, and his bark is more like a howl; his lower jaw often becomes paralysed, and general paralysis sometimes precedes death; and as a rule, on the fifth or sixth day he dies. The principal post mortem appearances are those enlargement and increased vascularity of the salivary glands, inflamed condition of the base of the tongue and fauces, epiglottis, and stomach, which last organ almost invariably contains such indigestible substances as straw, hair, offal, &c. The symptoms in the horse, which become apparent in a few weeks, are those of extreme irritability. He trembles, heaves, and paws, staggers, and falls; and after a severe struggle, he suddenly rises again, and appears settled and collected, when he will again exhibit the usual distressing symptoms. He is sometimes mischievous, bites, kicks, and snorts; and generally in three days he dies paralysed and exhausted.

The disease seems primarily to be one of *blood-poisoning*, and not, as some have recently stated it, an affection of the nervous system. We know that some instances of blood poisoning terminate with coma, or convulsions, but are not, on that account, to be considered as proceeding from nervous disease. Whatever may be the precise nature of the disease, it is certain that no cure has been discovered for it. The writer has seen many dogs, some horses, and an ox in all the different stages of it, and many attempts at a cure tried, without producing even any palliative effects, and every one of the patients died in the ordinary course, whether anything or nothing was done. As the disease is so rare, and—contrary to popular belief—is not more prevalent at one period of the year than another, no anticipatory precautionary measures can be taken. Preventive measures, however, when it is known, or even suspected, that the disease has manifested itself, should not for an instant be neglected. All dogs known to have been bitten, or been in the company of the rabid animal, should be immediately destroyed, and every other dog in the town and district confined, or closely muzzled, for several weeks, or even months. As to the measures to be taken when a human being is bitten by a rabid animal, see HYDROPHOBIA.

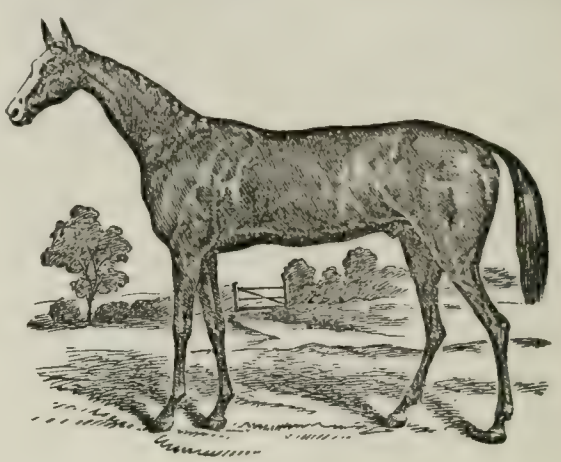
RABINET, a small piece of ordnance formerly in use. It weighed but 300 pounds, and fired a small ball of 1⅛ inch diameter, with a very limited range.

RACAHOUT, a farinaceous food imported from the Barbary coast, and sometimes recommended, but with questionable judiciousness, to invalids. It is believed to consist of the meal of the acorns of the Barbary Oak (*Quercus Ballota*), flavoured with some aromatic herb. It is sometimes sold under its French designation of *Racahout des Arabes*. It must not be confounded with Tacahout (q.v.).

RACCONIGI, a town in the west of Northern Italy, pleasantly situated on the Maira, 24 miles south of Turin by railway. Its palace, surrounded by a small but handsomely laid-out park, is one of

the country residences of the royal family. Silk fabrics and twist, and woollen cloths, are manufactured. Pop. 10,350.

RACCOO'N, or RACOON (*Procyon*), a genus of quadrupeds of the Bear family, *Ursidæ*, but differing widely from the typical members of that family, in being less perfectly plantigrade, the whole sole of the foot being indeed rested on the ground when the animal is still, but being partly raised when it walks, whilst when running it only touches the ground with the tips of its toes, and moves in a bounding manner. The dentition also differs from that of bears, there being, for one thing, only six instead of seven molars on each side in the lower jaw. The dentition indicates an aptitude both for animal and vegetable food. The general appearance may be described as intermediate between that of a fox and of a bear in miniature. The raccoons are exclusively American. The Common R. (*P. lotor*) is a native of North America, from Canada to the south of Mexico. It is about the size of a small fox, grayish-brown; the muzzle white. The hair is of two kinds, an under-coat soft and woolly, of a uniform gray; and long and rather stiff hairs projecting through the wool, and alternately marked with black and grayish-white. The R. frequents the seashore, and the margin of swamps and rivers. It commits great ravages on fields of Indian corn, plantations of sugar-cane, &c., and is not less destructive to poultry. It feeds much on oysters, particularly in the alluvial coast-lands of Carolina and neighbouring regions where the American oyster abounds on the banks of rivers and creeks, and exhibits great dexterity in opening oysters. It is also very fond of crabs and other crustaceans. It has a curious habit of dipping or washing its food in water, whence its specific name *Lotor* (Lat. washer). When pursued, it often takes refuge in a tree, climbing with great agility, but its destruction is then considered sure, whence the American proverbial reference to a *tree'd 'coon*. The fur of the R. is used in the manufacture of hats, and is a considerable article of commerce.—Another species, the



Raccoon (*Procyon lotor*).

CRAB-EATING R. (*P. cancrivorus*), the Crab-dog of Guiana, is found in all parts of South America east of the Andes. It is rather larger than the common R., although very similar to it.—Both species of R. display the same love of glittering things which is so remarkable in magpies, jackdaws, and others of the crow family. Mr Wood mentions in his *Natural History* that a common R. did its best to get a ring off his finger by hitching one of its crooked claws into the ring, and pulling with all its strength; and a gentleman once resident in Guiana informed the writer of this article that a crab-eating R., which he caught young, and completely tamed, shewed such a propensity to steal silver spoons, that he was obliged to send it away into the woods.

RACE. 'A *race* is a class of individuals concerning which there are doubts as to whether they constitute a separate species, or a variety of a recognised one. Hence the term is *subjective;* i. e., it applies to the *opinion of the investigator* rather than to the *object of the investigation;* so that its power is that of the symbol for an unknown quantity in algebra. The present writer having as yet found no tribe or family for which a sufficient reason for raising it to a new species has been adduced, has either not used the word *race* at all, or used it inadvertently. Its proper place is in *investigation*, not in exposition.' —Latham, *Natural History of the Varieties of Man.*

RACE, the portion of a loom from which the shuttle is projected through the shed, or separated threads of the warp.

RACEHORSE, a breed of horses distinguished for extreme fleetness. It owes its origin in great

Racehorse.

measure to Arabian, Barbary, and Turkish horses introduced into England. The great interest taken in Horse-racing (q. v.) since the time of James I., has led to the greatest care of the animals employed in it, and the utmost improvement of the breed. The racehorse is generally longer-bodied than the hunter, and the same power of leaping is not required. See HORSE-RACING.

RACE'ME (Lat. *racemus*, a bunch of grapes), in Botany, a form of Inflorescence (q. v.) which is *centripetal* (see CENTRIFUGAL AND CENTRIPETAL), and in which the flower-stalk throws off branchlets (*pedicels*) of nearly equal length, and each bearing a single flower. Familiar and very perfect examples of the R. may be seen in the Red or White Currant and in the Barberry. Notwithstanding the origin of the name, a bunch of grapes is not a true R., but a Panicle (q. v.).

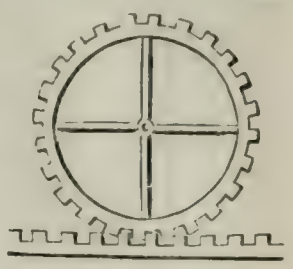
RACE'MIC ACID. See TARTARIC ACID.

RACHEL, ELISA (properly ELISA RACHEL FELIX), a celebrated French *tragedienne*, was born at Munf, in Switzerland, of poor Jewish parents, on the 28th February 1820. The family removed to Lyon, in France; and in order to aid in its support, the child R. and her sister Sarah were in the habit of singing for chance gratuities in the streets and cafés of the place. In 1831, the household was transferred to Paris, and for R., lessons were procured in singing from an eminent teacher of the day. In music, she gave no promise of special excellence; and in 1833, she made her first appearance on the stage as an actress. Though her talent had previously been discerned by certain of the more judicious (among others, Jules Janin and the celebrated Mademoiselle Mars), it was only in 1838 that in the character of Camille, in Corneille's tragedy

of *Les Horaces*, she first strongly attracted the attention of the public. The admiration excited by her performance rapidly grew into enthusiasm; and from this time forward, in the great parts supplied by the classic masterpieces of Corneille, Racine, and Voltaire, she shone without a rival. In 1843, her fame may be said to have culminated in her appearance as *Phèdre* in the tragedy of that name by Racine. In *Adrienne Lecouvreur*, a piece expressly written for her by MM. Legouvé and Scribe, she had also immense success, though in other more modern parts, her popularity was somewhat less. The *furor* excited in Paris in 1848 by her public recitation of the *Marseillaise Hymn*, in the interest of the revolutionary government, will continue to connect her name with the public history of the period. In 1849, she made the tour of the French provinces, and subsequently visited England and Russia, everywhere meeting with success and enthusiastic recognition. Her health, however, had begun to fail: in 1855, in the course of a professional visit to America, it altogether gave way, and she returned utterly prostrated. A residence at Cairo failed to restore her to strength; and on the 3d January 1858, she died at Cannet, near Toulon. As an artist, within the limits prescribed by her genius, she has probably never been quite equalled. Of the burning intensity which characterised her rendering of passion in its fiercer concentrations, no words can give an adequate image. 'She does not act—she suffers,' some one very well said of her. Her *Phèdre*—by common consent her masterpiece—was an apocalypse of human agony, not to be forgotten by any one who ever witnessed it. In character, R. was neither exemplary nor amiable. Of the details of her private life, it is as well that nothing should be said. In her professional relations, she was notoriously grasping and avaricious. Her immense popularity enabled her, during much of her career, pretty much to dictate her own terms to managers, and of this power, she is said to have availed herself without scruple or generosity. In this way she very rapidly amassed a large fortune. If little else of good is on record of her, she was constant in her home affections, and throughout she frankly made her whole family sharers of her prosperity.

RA'CHIS (Gr. the back-bone), in Botany, the *primary floral axis*, an elongation of the stem or of a branch, from which arise the flower-stalks (peduncles), or to which the flowers are immediately affixed.

RACINE, Jean, the most admired of all the French dramatists, was born at Ferté-Milon, 21st December 1639, of a respectable family belonging to the *bourgeoisie*. At the age of four he lost both his parents, and then went to live with his maternal grandfather, by whom he was sent to the college of Beauvais. Here he remained till he was 16, at which time his grandfather died. He was then taken to Port-Royal (q. v.), where his grandmother and his aunt Agnes were leading a recluse life, and placed at the school which had been opened in that celebrated retreat by the pious scholars assembled there. R. astonished his teachers by the rapidity of his progress in all his studies, especially in Greek; but he won their regards still more by the affectionate seriousness of his character, which gave a delicacy to his ardent sensibilities and vivid imagination. They loved him, yet they trembled for him. When they saw him wander—Sophocles or Euripides in his hand—among the shadows of the abbey, anxiety took possession of their hearts; and when they learned that he secretly indulged in the sinful pastime of making verses, they even thought it necessary to punish their favourite. Their pious mind was indeed an odd one, for they obliged him to turn the hymns of the Roman breviary into French verse! Novels were placed under the same ban as poetry. One day the sacristan [illegible] found him reading the Byzantine romance of Bishop Heliodorus (q. v.), entitled *The Loves of Theagenes and Chariclea*, and threw the book in the fire; but R. says that it was already fixed in his memory, and that he smiled at this futile attempt to rob him of it. We can easily see that R. was not at all unwilling disposed as yet. After a residence of three years at Port Royal, during which time he had, among other things, read and annotated the best Greek and Latin classics, he went to the College d'Harcourt to finish his curriculum with the study of logic. Then he went out to 'see life,' got into bad company, became irregular himself, and even grew so reckless as to burlesque, in his correspondence, the pious phraseology in vogue at Port Royal. Deep was the grief and incessant were the remonstrances of his old friends, but they were long without avail. He had made some little name as a poet by an Ode on the marriage of the king, and had had the good fortune to get a pension for it, but still his income was small and precarious, and when a maternal uncle, who was a canon regular of the church of St Geneviève at Uzès, in Languedoc, held out to him the hope of a benefice, R. went to live with him in 1661, and tried to study systematic theology. But the effort was a hopeless one. While he gazed vacantly into the *Summa* of St Thomas, his thoughts were with Ariosto and Sophocles. In the summer of 1662, he returned to Paris in disgust, and commenced life as a dramatic writer, having meanwhile made the acquaintance of Molière and Boileau. His first piece was the *Frères ennemis*, played in 1664; but it was not till 1667, when his *Andromaque* appeared, that the power and peculiar character of his genius excited marked attention. For the next ten years, his career as a dramatist was unsurpassably brilliant, yet, strange to say, we know almost nothing of his private or social life during that time. We have to content ourselves with little more than a few meagre facts relative to his literary performances, the chief of which are *Britannicus*, *Bérénice*, *Bajazet*, *Mithridate*, *Iphigénie*, and *Phèdre*. Suddenly, at the early age of 38, in the full sunshine of his fame and vigour of his power, he resolved to abandon both the stage and the world, and become a Carthusian monk. The effect of his Port-Royal training was now seen. In the midst of all his literary ambitions and strifes, his little excesses, irregularities, and amours, R. had carried with him a keen and faithful consciousness; and partly from disappointment, partly from remorse, he longed to forget all in acts of devotion. With difficulty, he was prevailed upon to modify the rigour of his purpose, and instead of seeking for religious felicity through the privations of solitude, and the severities of penance, to do so through marriage with some pious woman, and the cultivation of domestic virtues. A suitable lady, very devout, but not very intelligent, was found for the poet in the daughter of the city-treasurer of Amiens, and the marriage took place in 1677. Seven children, two sons and five daughters, were the fruit of this union. Shortly after it, R. was appointed historiographer to the king. Henceforth, his course of life was pursued with the utmost regularity, one-third of the day being given to God, another to his family and friends, and the remainder to the king. His *Esther* (1689) and *Athalie* (1691) are the only dramas which he produced after his conversion, and they are profoundly imbued with religious



feeling. *Athalie* is reckoned by some his finest effort, and certainly the only one which can at all be placed in comparison with it is the *Phèdre*. The poet died, after a brief illness, on the 21st of April 1699.

R.'s dramatic genius was essentially French, or pseudo-classical, and therefore it is not easy for Englishmen trained to appreciate the power, magnificence, and variety of the Shakspearian tragedy, to sympathise with it or to criticise it impartially. In the eyes of his countrymen, he is the most perfect, if not the most sublime, of all their dramatists. Corneille may at times exhibit a grander and more rugged energy, but in beauty, grace, and a certain tender majesty of style, R. is held to be without a rival; and it must be remembered that *style*, and not portraiture of human character, is the thing in which French dramatists aim to shine. The declamations in which the heroes and heroines of R. indulge, are marvellously fine pieces of rhetoric; but, compared with the Elizabethan drama, they are deficient in deep insight into human nature and in genuine passion, while humour is altogether excluded. See *Mémoires* of R., edited by his son Louis. The editions of his works are innumerable, and some are of great splendour; that of Girodet (Paris, 3 vols. 1801—1805) being reckoned one of the finest specimens of typography in the world.

RACI'NE, a city of Wisconsin, U.S., situated on Lake Michigan, at the mouth of Root River, which forms an excellent harbour, and on the line of the Chicago and Milwaukee Railway, 23 miles south of Milwaukee. It has 3 ship-yards, factories, and furnaces. Pop. (in 1870), 9880.

RACK (Sax. *wrocan*, Ger. *recken*, to stretch), an instrument of torture, used for extracting confessions from criminals and suspected persons. It consisted of a large oblong frame of wood, with four beams a little raised from the ground, on which the sufferer was stretched and bound. Cords were attached to his extremities, and gradually strained by means of a lever and pulleys, till the operation, if persisted in, caused dislocation of the limbs. The rack was known in the 1st and 2d centuries in the south of Europe, and applied to the early Christians. It was in use in England in the 15th and 16th centuries. According to Coke, it was first introduced into the Tower by the Duke of Exeter, Constable of the Tower, in 1447, whence it came to be called the 'Duke of Exeter's daughter.' It is mentioned by Holinshed in 1467; but its use first became common in the time of Henry VIII. as an implement of torture for prisoners confined in the Tower. The infliction of the punishment of the rack took place during the reign of the Tudor sovereigns by warrant of council, or under the sign-manual. In 1628, however, on the murder by Felton of the Duke of Buckingham, it being proposed in the Privy Council to put the assassin to the rack, in order that he might discover his accomplices, the judges resisted the proceeding, as contrary to the law of England. In various countries of Europe, the rack has been much used both by the civil authorities in cases of traitors and conspirators, and by members of the Inquisition to extort a recantation of heresy. It is no longer in use in any part of Europe.

RACK, or RACK-WORK, is a straight bar, with cogs or teeth placed along it, so as to correspond with similar cogs or teeth placed on a wheel, thus: If the bar is not movable, the wheel is attached to a traversing frame, and as it revolves, is moved along by the resistance of its teeth to those on the bar. It was in this way that the formation of a railway was first projected; the rail and the driving-wheel of the engine to be both furnished with corresponding teeth. In mechanics, rack-work has innumerable applications.

Rack-work.

RA'CKETS (Fr. *raquette*), a game frequently played in England; it is merely a modern variety of the old game of TENNIS (q. v.).

RACK RENT is the full yearly value of lands let upon lease, or to an occupier, or held by a tenant for life, as distinguished from the value fixed by the lease or agreement between the parties, and which is often less or greater than the real value.

RACOO'NDA, or NUTRIA, the fur of the Coypu (q. v.).

RACZ, or O BECZE, a town of Hungary, in the Servian Wojwodschaft, on the right bank of the Theiss, 26 miles north-east of Peterwardein. It carries on an extensive trade in corn. Pop. 11,000.

RADACK AND RALICK, two parallel chains of islands in the group called Marshall's Islands. See POLYNESIA.

RADCLIFFE, DR JOHN, a celebrated physician, and the founder of the Radcliffe Library at Oxford, was born at Wakefield in Yorkshire, in the year 1650. He was instructed in Greek and Latin at the grammar-school of his native town; and at the early age of 15, was sent to University College, Oxford. In 1672, he took his degree of M.A., applied himself to the study of medicine, and having taken his degree of M.B. in 1675, began to practise as a licentiate at Oxford. He immediately made himself conspicuous by the originality of some of his ideas, treating the cases in which he was engaged with a total disregard of the usually received rules of the profession, and even holding up these to censure and ridicule. At the very commencement of his practice he made some remarkable cures; and in less than two years, was on the high road to celebrity. In 1682, he took the degree of M.D., and remained still two years longer at Oxford in the practice of a lucrative profession.

In 1684, Dr R. removed to London. He established himself in Bow Street, Covent Garden, where, in less than a year, he became the most popular physician of his time. It is said that his conversational powers, ready wit, and pleasantry contributed to this result, quite as much as his professional skill. In 1686, the Princess Anne of Denmark made him her physician. After the Revolution, he was sent for by King William, who frequently had recourse to his advice, and the example of the sovereign was followed by most of the nobility and influential persons about the court. Dr R., however, was himself no courtier; he had no occasion to become one. Dr Mead, who knew him well, pronounced of him, that he was 'deservedly at the head of his profession, on account of his great medical penetration and experience.' Blunt and independent in his manners—some indeed say even *brutal*, people nevertheless recognised under his rough exterior that quick perception and keen observation of symptoms which are so important in a master of the healing art; and thus his advice was asked by persons of all ranks, in return for which he received fees of an unprecedented amount.

In 1694, he was called upon to attend Queen Mary, when attacked by the small-pox. It proved to be her last illness, as Dr R. predicted, even before seeing her—merely upon reading the prescriptions

of the other physicians in attendance before he was sent for. He did what he could, however, to save her, but in vain; and some attributed her death either to his want of skill or negligence. About this time he offended the Princess Anne, who, having sent for him on some occasion to St James's, had the mortification to hear that he swore all her Royal Highness's ailments were nothing else than 'the vapours.' This, combined with her knowledge of Dr R.'s too great fondness for the bottle, made her appoint Dr Gibbons as her physician in his place. Still, the king continued to employ him. On one occasion, he sent for him to the Netherlands to attend upon his favourite, the Earl of Albemarle, for which he received £1200 from the king, and £400 from the patient himself, besides a diamond ring. To the king himself, he frequently spoke with much honesty and plainness concerning his ailments; once, however, he took too great a liberty, for upon his Majesty shewing him his swollen ankles, and asking him what he thought of them, Dr R. replied: 'Why, truly, I would not have your Majesty's two legs for your three kingdoms.' This was towards the end of 1699. He was not again consulted by that sovereign, who soon afterwards died; nor was he ever again completely reinstated in the good graces of Queen Anne, although she occasionally consulted him, and rewarded him handsomely for his services.

In 1713, he was elected M.P. for Buckingham. He had a country-house at Carshalton, to which he used occasionally to retire; and here he was living in 1714, when Queen Anne was attacked with what proved to be her last illness. Dr R. was summoned to attend her; but he either would not or could not come. He had taken physic, he said, and it was impossible for him to attend. The queen died in August; and the populace were so enraged against Dr R., that he dared not again shew his face in London. This much chagrined him, as it kept him a prisoner in a country village. His own end, however, was fast approaching. He must have been really ill when sent for to the queen, as he himself survived her for only two or three months. Dr R. died of gout at Carshalton on the 1st November 1714, and was buried at Oxford in St Mary's Church with much ceremony. He died possessed of considerable property, the whole of which he bequeathed to public uses. Thus, to University College he left his estate in Yorkshire, in trust, for the endowment of two travelling fellowships, and the purchase of perpetual advowsons, together with £5000 for the enlargement of the college buildings. He left £40,000 for the erection of a public library in Oxford, since known as the Radcliffe Library (q.v.), which he endowed with £150 per annum for a librarian, and £100 per annum for the purchase of books. To St Bartholomew's Hospital, London, he bequeathed the yearly sum of £500 towards mending the diet, and £100 per annum for the purchase of linen. The rest of his property he gave to his executors in trust for such charitable purposes as they might best approve. The Radcliffe Infirmary and Radcliffe Observatory, at Oxford, were both erected out of this fund; and from the same source, in 1823, the Radcliffe Trustees contributed the sum of £2000 towards the erection of the College of Physicians in Pall Mall.

RADCLIFFE, Ann, the most popular English novelist at the close of the last century, was born in London, July 9, 1764. She was of respectable parents named Ward. In her 23d year, she married Mr William Radcliffe, a student of law, but who became proprietor and editor of a weekly newspaper, the *English Chronicle*. Mrs R. lived much in retirement, known only to a few friends by whom she was warmly esteemed. Her works are *The Castles of Athlin and Dunbayne* (1789), *A Sicilian Romance* (1790), *The Romance of the Forest* (1791), *The Mysteries of Udolpho* (1794), *A Journey through Holland*, &c (1794), and *The Italian* (1797). Mrs R.'s popularity was constantly increasing down to the date of her latest work, when, in her 41st year, 'like an actress in full possession of her applauded powers,' as Scott has remarked, 'she chose to retreat from the stage in the full blaze of her fame.' She lived 26 years afterwards, dying in 1823. For the copyright of her *Mysteries of Udolpho*, her best work, she received £500, and for that of *The Italian*, £800. These sums were at the time considered excessive, and were perhaps the largest ever given in this country for works of fiction until the great era of the Waverley Novels. A slight romance, entitled *Gaston de Blondeville*, and a collection of *Poems* by Mrs R., were published after her death.

As a novelist, Mrs R. is pre-eminent for vivid poetical imagination, and for great power of romantic narrative and description. Her paintings of external nature, and of scenes of feudal pomp, gloom, terror, or mystery, are quite unrivalled in modern romance. In the art of awakening curiosity and enchaining attention, she is no less skilful. She keeps her readers in a state of breathless awe and suspense; but in the end, when she resolves all the seemingly supernatural agencies and horrors of her tales into simple natural causes, she unpleasantly fails, for her explanations are inadequate to account for the effects produced. She has also little variety of character or striking individual portraits, and no wit or humour. Hence her works, with all their gorgeous pictures and potent spells, seldom interest beyond the period of youth.

RADCLIFFE LIBRARY, Oxford. This institution, founded by Dr John Radcliffe (q.v.), stands in the central area of Radcliffe Square. The building is in the form of a rotunda, standing upon arcades, from the centre of which rises a spacious and well-proportioned dome. This dome is 84 feet in height from the pavement, and is beautifully wrought in stucco. The architect was James Gibbs, who commenced the building in 1737, and completed it in 1747. The library is approached by a handsome stone staircase, and over the entrance-door hangs the portrait of the founder by Sir G. Kneller. The books composing the library are for the most part works on natural history, physical science, and medicine. Besides these, Gibbs, the architect, bequeathed to it a collection of works, chiefly architectural; Wise, the first librarian, a collection of coins; Kennicott, a theological collection; Frewen, a miscellaneous library; Viner, some law-books; while from the Frazer and Sale collections, the trustees purchased 355 Oriental MSS. in the years 1758 and 1760. In 1856, the number of volumes comprising the scientific and medical collection was estimated by Dr Acland, the librarian, as not less than 14,000, and not more than 15,000. From the year 1834 to the year 1840, the trustees expended £500 annually on the purchase of books. The grant, however, was reduced to £200 in 1841, and continued at that low figure until 1863, when it was again raised to the sum of £500. In 1861, by an agreement between the Radcliffe Trustees and the university, the scientific books of the Radcliffe Library were removed to the University Museum, then recently erected, for public use under prescribed regulations, and the spacious room in the Radcliffe Library was opened as a reading-room in connection with the Bodleian Library. This reading-room is now open daily until 10 o'clock at night, to the great comfort and convenience of numerous readers.

RADEGUNDA, St, daughter of Berthar, a prince of Thuringia, in the earlier part of the 6th century. Having been carried as a prisoner to France in the twelfth year of her age by Clotaire, at that time king of the district whose capital is now called Soissons, she was educated in the Christian religion, and when she reached a maturer age, was induced, very reluctantly, to become the wife of Clotaire. Her own wish having been to become a nun, her married life was in great measure given up to works of charity and religion, and Clotaire complained that he 'had married a nun rather than a queen.' Eventually, about the year 553, she obtained his leave to retire to a monastery at Noyon, where she was consecrated a deaconess by the bishop Medard. Soon afterwards, she founded a monastery at Poitiers, in which she lived as a simple sister, but which she endowed richly, not only with money and lands, but also with relics and other sacred objects obtained from the Holy Land and all the more eminent churches of the East and West. It was on the occasion of the translation to her church at Poitiers of a relic of the holy cross that the Christian poet Vexantius Fortunatus composed the celebrated and truly magnificent Latin hymn *Vexilla Regis Proderent*. R. outlived him by more than a quarter of a century, during which she was regarded as a model of Christian virtue; and her life has formed the subject of many beautiful legends, still popular in Germany and France. Her monastery, before her death, which took place in 587, numbered no fewer than 200 nuns. Her feast is held on August 13, the anniversary of her death.

RADETSKY, Johann Joseph Wenzel, Count of Radetz, and an Austrian field-marshal, was born at Tzrebnitz, in Bohemia, in November 1766; and in 1784, entered the Austrian military service as a cadet in a Hungarian cavalry regiment, making his first campaign against the Turks in 1788—1789. He took part in the Austrian wars with Napoleon, brilliantly distinguished himself, and rose to the rank of lieutenant field-marshal. After the conclusion of peace, he was stationed mostly in Hungary; but the threatening aspect of affairs in Italy caused him to be sent to take the command of the Austrian army in Lombardy; hostilities were, however, deferred, and R. seized this opportunity of putting Verona in a complete state of defence. The Emperor Ferdinand, on his accession in 1836, acknowledged R.'s numerous and valuable services by raising him to the rank of field-marshal. The rebellion at last broke out suddenly in 1848, and R. was forced to retire from Milan and continue his retreat to Verona (April 2). His departure was the signal for a general insurrection, only the renowned Quadrilateral (q. v.) and the citadel of Ferrara remaining in the hands of the Austrians; and the revolt of Venice cut off all R.'s communications except that to the Tyrol. The Piedmontese army had now effected the passage of the Mincio (May 7), and closely invested Peschiera, thus rendering R.'s position an extremely critical one. He had only 50,000 men to oppose to the Piedmontese army of 41,000 men around Peschiera, a corps of observation 6000 strong near Mantua, a body of 4000 guarding the passage of the Mincio, the Roman army of 14,000 men holding the south bank of the Po, and an army of Venetian insurgents, numbering 15,000, in his rear. Being thus unable to take the offensive, he waited anxiously for the reinforcements which he expected by the Illyrian frontier, and which, after defeating the Venetian and Roman armies which attempted to stop their progress, joined him at Verona on May 22. The Austrians now assumed the offensive, and marched on Mantua, defeating the Italians in two bloody conflicts at Montanara and Curtatone, but were in turn signally vanquished at Goito by Charles Albert, who gained by this victory the immediate surrender of Peschiera (May 29), and rendered R.'s position more critical than ever. But the gallant Sardinian was no match for R. in generalship, for he wasted his time before Mantua, till R. had raised an army of 82,000 men, with which he drove the king (July 22 and 23) back, defeated him at Custozza (July 25), pursued him closely, converted his retreat into a disorderly flight, and again defeated him under the walls of Milan (August 4). The king was now besieged in Milan, but (August 6) a six months' armistice was agreed to, and war was not resumed by the Piedmontese till March 1849. R. was this time better prepared, and at once invaded Piedmont; after a successful brush with the enemy at Vigevano (March 21), he totally routed them at Novara (March 23), after an obstinate conflict of six hours' duration. Peace was now concluded with Piedmont, and R. next besieged Venice, which surrendered after a long siege (August 23). He was then appointed governor-general of Lombardy and Venice, and ruled with absolute authority till his retirement on February 28, 1857, suppressing all insurrections and disturbances with the utmost rigour. He died at Milan, January 5, 1858, at the age of 91 years. He bore the character of a brave soldier and consummate tactician, and, strange to say, acquired all his European reputation after he had passed his 80th year.

RADIA'TA, the lowest of Cuvier's four great divisions of the animal kingdom, derive their name from the organs of sense and motion being disposed as rays round a centre; the other three, in ascending order, being the *Articulata*, the *Mollusca*, and the *Vertebrata*. Before Cuvier's time, all invertebrate animals were divided into *Worms* and *Insects*. In 1795, he presented a Memoir to the Natural History Society of Paris, in which, to use his own words, he 'marked the characters and limits of the molluscs, crustaceans, insects, worms, echinoderms, and zoophytes;' and in a Memoir read before the Institute in July 1812, he 'distributed these various classes under three grand divisions, each of which is comparable to that of the vertebrate animals.' The necessity for the dismemberment and re-arrangement of this heterogeneous assemblage which Cuvier grouped together in his Radiata, has long been felt; and at the present day, 'the radiate mob' (as Professor Huxley terms it) may be regarded as effectually demolished. To shew how these animals have been re-arranged, it is necessary first to mention that Cuvier himself divided them into five classes —namely, (1) the *Echinodermata*, (2) the *Entozoa* (or Intestinal Worms), (3) the *Acalephæ* (or Sea-nettles), (4) the *Polypi*, and (5) the *Infusoria*. The *Echinodermata* are now included by Huxley (*Elements of Comparative Anatomy*, 1864) in the *Annuloida* (one of the eight primary groups into which he divides the whole animal kingdom); while J. Victor Carus (*Handbuch der Zoologie*, 1863) makes them an independent group. The Entozoa are placed by Huxley under the *Annuloida*, and by Carus under the *Vermes*. The Acalephæ are by unanimous consent placed in the *Cœlenterata*, a primary group established by Frey and Leuckart. Of the Polypi, those with ciliated arms (the Bryozoa or Polyzoa, of which the Sea-mat or Flustra is a well-known example) are now placed among the lower molluscs, which, under the term *Molluscoida*, are considered by Huxley as one of the eight primary groups; while the remainder are placed amongst the *Cœlenterata*. The Infusoria are now regarded by most zoologists as a class of the

Protozoa (q. v.), a primary group established by Siebold.

RADIA'TION OF HEAT. See HEAT.

RA'DICAL (Lat. *radicalis*, fundamental, from *radix*, root), originally *radical reformer*, a name applied to one of the political party which advocates extreme changes of a democratic character in the state.

RADIOLITÉS, a genus of lamellibranchiate mollusca, found only in Cretaceous rocks, and remarkable for the great diversity of its valves. The upper valve is flat or conical, with a central umbo; and the lower is an elongated cone, and has on its inner surface two large dental sockets, and lateral muscular impressions. The upper valve is not perforated with canals, as in the nearly related genus Hippurites. More than forty species have been described.

RADISH (*Raphănus*), a genus of plants, of the natural order *Cruciferæ*, having a spongy Silique (q. v.), which does not split open when ripe, ends in a conical or awl-shaped beak, and is more or less divided into transverse cells, in some species adhering together even in decay, and in some falling asunder. The flowers are yellow, red, or purple. —The COMMON R. (*R. sativus*) has thick, round, tapering, and pointed pods, little longer than their stalks, very slightly contracted, and not falling to pieces. It is an annual, with branching stem from two to four feet high, rough lyre-shaped leaves, and pale violet-coloured flowers with dark veins. It is a native of Asia, from the coasts of the Mediterranean to Japan, and has been cultivated in China, India, and Europe from the most ancient times, for the sake of its fleshy roots, which have a sharp biting taste, and are much used when young as a salad, and also to some extent as a boiled vegetable. In this latter way, the young and tender leaves were also formerly used. The varieties of R. in cultivation are extremely numerous; but they are generally classed under the two heads of *Long-rooted* and *Turnip-rooted* Radishes, the roots of the former resembling the carrot in shape, and the latter the turnip. The varieties differ very much, not only in form of root, but in colour and size, a red colour generally prevailing. Some of the darker-coloured turnip-rooted radishes attain the size of a man's head. Radishes are sown at different seasons, and are generally used when young and small; but some kinds are occasionally stored for winter. The root of the R. possesses demulcent, stimulant, and diuretic properties, and is sometimes used in cases of atony, or of excessive secretion of mucus by the organs of digestion or the urinary organs. R. juice, mixed with sugar-candy, is a popular and useful German remedy for hoarseness and cough.—Distinct from both the varieties above-named is the OIL R., which has a slender—scarcely fleshy—root, a short much-branched stem, and many-seeded pods. It is cultivated in China for the oil of its seeds.—Another species of R. (*R. caudatus*), a native of Japan, is there cultivated as an esculent.—To this genus belongs the JOINTED CHARLOCK of our corn fields (*R. raphanistrum*), which has found its way from Europe to North America, and is a troublesome weed there also. The seeds, however, may be advantageously crushed for oil.—The SEA R. (*R. maritimus*) is a more rare British species, the roots of which are of fine quality and great pungency.

RA'DIUS, in Geometry, is a straight line drawn from the centre to the circumference of a circle. See CIRCLE and QUADRATURE. In Trigonometry, the radius is taken as unity, and the sines, cosines, &c. are expressed in terms of it. In Astronomy, the same term is employed in a slightly different sense; and to prevent confusion, it is changed into *radius-vector*. The radius vector is a straight line drawn from the centre of force to the position of a body which describes its orbit round that centre; if the orbit is a circle, the radius vector is invariable in its length, but constantly changes if the orbit is any of the other conic sections. From astronomy the term has been transferred to what are called *polar equations* in the higher mathematics. To express a curve by this method a point is taken for the *pole*; through this point a line, the *axis*, is drawn, indefinite in length and arbitrary in direction; then as one end of the radius vector is at the pole, its inclination to the axis, and its length at this inclination, will give a point in the curve. Equations to curves, when thus expressed in terms of the radius vector, and its inclination to the axis, are called *polar co-ordinates*, and are generally much simpler in form than when expressed by rectangular *Coordinates* (q. v.).

RA'DNOR, NEW, a municipal and parliamentary borough in Radnorshire, of which it was formerly the capital, stands in the midst of exceedingly wild and hilly scenery, on the south border of Radnor Forest, and eight miles west-south-west of Presteign. In the immediate vicinity is the cascade of *Water-break-its-neck*, which descends from a height of 70 feet, and is one of the most celebrated in Wales. New R., once comparatively important, has dwindled into a small country town, remarkable only for the beauty of the surrounding scenery. In 1864, a statue in memory of Sir George Cornewall Lewis was erected at New Radnor. Pop. (of parliamentary borough) 2262. The business of the county is transacted at Presteign, the county town, which contains 1743 inhabitants.

RADNORSHIRE, an inland county of South Wales, bounded on the N. by Montgomeryshire and Shropshire, and on the S. and S. E. by Brecknockshire and Herefordshire. Area, 272,128 acres; pop. (1871), 25,428. Groups of mountains, seldom forming themselves into continuous chains, cover the greater part of the surface of the county. Radnor Forest, which attains the height of 2163 feet, runs east and west, and is the loftiest and most connected of the ranges. The south-eastern district is flat, with a gradual slope towards the east. Of the rivers, the chief of which flow southward, the principal is the Wye (which forms the greater part of the southern boundary of the county), and its tributaries the Ithon, the Elan, and the Lugg. The county formerly comprised large tracts of bog and moorland, which are in course of being gradually reclaimed and cultivated. Its valleys, especially that watered by the Lugg, are famed for the richness of their pastures, which feed splendid herds of 'Herefords.' In the east and south-east districts of R. excellent wheat, barley, oats, and potatoes are grown. Sheep-farming, however, is the most profitable; on the pastures and common or waste lands, large flocks are supported, and in the more sheltered quarters, cattle are reared. The county returns one member to the House of Commons.

RA'DOM, a government of the kingdom of Poland (q. v.), extends immediately south-east of the government of Warsaw. Area, 4729 sq. m.; pop., 471,658. The surface, partly traversed by the Sandomir Mountains, which rise in the Katherinenberge to the height of upwards of 2000 feet, is the most elevated of the kingdom. The principal rivers are the Pilica and the Vistula, both of which flow north. The soil is diversified.

RADOM, capital of the government of the same

name, stands on the Radomka, 60 miles south of Warsaw. It has considerably improved in size within late years, and is the seat of an active trade and commerce. Pop. 6477.

RADOWITZ, Joseph von, Prussian general and statesman, born February 6, 1797, at Blankenburg, was the son of a nobleman of Hungarian descent, received his professional education at Paris, and in the Military School of the kingdom of Westphalia, which he left in 1813, in order to enter the Westphalian army as an officer. After the peace in 1815, he received an appointment as Master of Mathematical and Military Sciences in the Military School of Cassel; but in 1823, he entered the Prussian service, and in 1830, became chief of the general staff of artillery. By his marriage with the Countess Maria v. Voss (1828), he became connected with the Prussian aristocracy, and soon became the leader of the anti-revolutionary party. In 1836, R. was sent as Prussian military commissioner plenipotentiary to the German Diet at Frankfurt. In 1842, he was named ambassador extraordinary and minister plenipotentiary at the courts of Carlsruhe, Darmstadt, and Nassau; and in 1845, he was raised to the rank of major-general. Meanwhile his influence on public affairs in Germany became more and more conspicuous; above all, he was the confidant and adviser of King Frederick-William IV. in his endeavours to bring about a reform of the German Diet, as his pamphlet, Germany and Frederick-William IV. (*Deutschland und Friedrich Wilhelm IV.*, Hamb. 1848), proves. His Conversations about State and Church, suggested by the present state of affairs (*Gespräche aus der Gegenwart über Staat und Kirche*, Stuttg. 1846) may be taken as a manifestation of the intentions which tried to find a practical issue in the constitution of February 3, 1847. When the revolution of 1848 broke out, a new field opened itself for Radowitz. The endeavours of Prussia to give a constitution to Germany, by means of the alliance of the three kings, was principally his work. He now obtained the leadership of the affairs of the union in the Prussian chambers as well as in the parliament, which assembled (March 1850) at Erfurt, but was unable to prevent the failure of the union scheme. On September 27, 1850, he became formally Secretary for Foreign Affairs, but in 1851 retired to Erfurt, where he wrote his *Neue Gespräche aus der Gegenwart* (2 vols., Erf. and Leip. 1851). He died December 25, 1853.—Consult Frensdorff, *Joseph v. R. A.* (Leip. 1850).

RAEBURN, Sir Henry, R. A., a distinguished portrait-painter, was born on March 4, 1756, at Stockbridge, then a village near Edinburgh, where his father was a manufacturer. His parents died when he was little more than six years old, and he was educated in that well-known institution, George Heriot's Hospital. He was apprenticed to a goldsmith and jeweller when about fifteen years of age; but having a very decided taste for art, he practised miniature-painting during his leisure hours with such success, that he was soon enabled to buy up his indenture, and devote himself first to miniature, and not long after to portrait-painting in oil. He married when he was twenty-two, and acquired some fortune by his wife. Proceeding to London, with introductions to Sir Joshua Reynolds, he was kindly received by him, and practised in his studio for about two months. Sir Joshua very soon perceived the high talent evinced by the young artist; advised him to visit Rome, and offered him funds for the purpose. Acting on this advice—he had funds sufficient—R. set out, furnished with letters from Reynolds to Pompeo, Battone, and other artists of note in Rome at the time. After remaining two years in Italy, he returned, and settled in Edinburgh in 1787, where he soon received full employment as a portrait-painter. In 1812, R. was elected President of the Society of Artists in Edinburgh; in 1814, Associate of the Royal Academy of London, and in the following year, Academician. He was knighted in 1822, when George IV. visited Scotland, and shortly after was appointed King's Limner for Scotland. He died at Edinburgh on 8th July 1823. R.'s style was modelled in a great degree on that of Reynolds—he aimed, like him, in his pictures to produce breadth—which is the effect obtained by massing together and keeping as far as possible the lights distinct from the shadows, and making them respectively effective, in place of dividing and mixing them up all over the picture; but he carried out this principle in a manner and with a feeling peculiarly his own. He never attempted, by thick impasto and semi-transparent painting, to produce texture and luminous effect, but adopted the opposite mode of painting in a low tone with a sharp touch, working his colours with little admixture of any unctuous medium. In his portraits of men, in particular, he gives the characteristic expression in a simple but decided and effective manner. His style has been thought by connoisseurs to resemble in many respects that of Velasquez. R.'s reputation was very high in his lifetime, and it is still rising, his pictures being now much sought after. Among the notable personages who sat to R. for their portraits were Sir David Baird, Sir Walter Scott, Henry Mackenzie, Neil Gow, Harry Erskine, Dugald Stewart, Professor Playfair, Dr George Hill, Francis Jeffrey, Henry Cockburn, and many of the Scottish nobility.

RAFFLES, Sir Thomas Stamford, a distinguished traveller and naturalist, was the son of a captain in the West India trade, and was born at sea, off Port Morant in Jamaica, on the 5th of July 1781. His first appointment was to a clerkship in the East India House. Having attracted the notice of his superiors by his talents and industry, he received a permanent appointment in the office. In 1805, the Court of Directors determined on sending out an establishment to Penang or Prince of Wales' Island, and young R. was appointed assistant-secretary. He arrived at Penang in September of the same year; and having studied the Malay language with great diligence during the voyage, he was enabled to enter upon his duties with efficiency on his arrival. He continued his study of the Malay and other eastern languages, in which he made considerable progress. Eventually, R. was made principal secretary. In 1808, he made a voyage to Malacca, where he had the opportunity of mixing with Javanese, Amboynians, Borneans, Papuans, Cochin-Chinese, and Chinese Proper. With respect to Malacca itself, he collected much interesting information. In 1811, when it was resolved by the English government to take possession of Java, then belonging to the Dutch, it was arranged that Mr R. should accompany the expedition as secretary to the governor-general, Lord Minto, who was himself to take the chief command. After some hard fighting, the troops took possession of the island. Mr R. received the appointment of lieutenant-governor of Java and its dependencies; and upon the departure of Lord Minto, took upon himself the entire administration of the newly-acquired territory. Much had still to be done in the way of conciliating the native princes and chiefs to the British rule. He had to appoint British residents at several of the native courts, and to frame rules

and regulations for their conduct. He ordered a general survey to be made of the whole island, the reading of which, as well as of all the reports connected with that and other things, occupied a considerable part of his time. By frequent personal interviews with the natives also, he sought to become acquainted with their manners and character, and to make such regulations as would be for their best interests both morally and materially. While engaged in this career of usefulness, his health gave way; and in 1816 he returned to England, stopping by the way at St Helena, where he had an interview with Napoleon. On his arrival in England, he wrote his well known *History of Java*, published in two volumes 4to in 1817, in which year he received the honour of knighthood. Java having by this time been restored to the Dutch, Sir Stamford R. was appointed lieutenant-governor of Bencoolen, a settlement upon the coast of Sumatra, where he landed in March 1818. In the latter part of that year he was called to Calcutta, on a visit of business, and instead of returning directly to Bencoolen, was sent to form a new settlement at Singapore. Here he remained for some months, and then again returned to Bencoolen, where he continued to discharge the duties of lieutenant-governor until February 1824, when he was compelled by ill-health to return to England. The vessel in which he set sail took fire, the crew and passengers escaping with difficulty in the boats. By this accident, Sir Stamford R. lost the greatest part of his effects, including a fine collection of natural history, and other things, valued at about £20,000. After his arrival in England, he lived to carry out what had been one of his favourite projects—namely, the formation of the Zoological Society of London, of which he was named President, and to the interests of which he devoted himself to the time of his death. This took place on the 5th of July 1826.

RAFFLE'SIA, a remarkable genus of plants belonging to the small natural order *Rafflesiaceæ*, an order composed entirely of parasitic plants,

Rafflesia Arnoldi.

which consist merely of a flower, and form part of the *Rhizogens* (q. v.) of Lindley. The *Rafflesiaceæ* are natives partly of the Indian islands and partly of South America. The plants of the genus *Rafflesia* have neither stalk nor leaves, but are mere flowers seated upon the roots of species of *Cissus*, making their appearance at first as a hemispherical swelling of the bark of the root, and, after the bark has broken, rising up in the form of a head of cabbage, whilst the perianth is covered with imbricated bracteæ, which are more or less recurved after it has opened. The perianth is thick, fleshy, and 5-parted. The germen is inferior, and contains many ovules; and the anthers, which are numerous, are seated under the reflexed margin of the top of the style column. After the flower has expanded, it diffuses a carrion-like smell that even attracts flies, and induces them to deposit their eggs. The largest and first discovered species, *R. Arnoldi*, was discovered in 1818 in Sumatra by Dr Arnold, and was sent to the eminent botanist, Robert Brown, by Sir Thomas Stamford Raffles, the British governor in Sumatra. Its flower measures fully three feet in diameter, is capable of containing almost two gallons of fluid, sometimes weighs ten pounds, and is the largest of all known flowers. A smaller species, *R. patma*, whose flowers are 16 inches or 2 feet in diameter, is highly prized by the Javanese as a medicine, for its strong styptic powers. *R. Hasseltii*, another Javanese species, is still smaller, its flowers being only three inches broad.

RAFN, KARL CHRISTIAN, a celebrated Danish critic and archæologist, was born at Langeland in the island of Funen, January 16, 1795, and educated at the university of Copenhagen, of which he was appointed sub-librarian in 1821. Even while a boy at the gymnasium of Odense, he was distinguished by his fondness for the old Norse literature and language, and when he became officially connected with the university, he undertook a general revision of all the Icelandic and Old Norse MSS. preserved there. It is to R.'s unwearied exertions that Denmark owes the foundation (1825) of the 'Society for Northern Antiquities,' whose principal object is the publication and criticism of all documents that can throw light on the subject of Old Norse literature. To this single end, Rafn devoted his whole life. As Secretary of the 'Society,' he edited and published a great many ancient Scandinavian MSS., occupying about seventy volumes. Among his numerous important works, we may mention a Danish translation of Norse Mythic and Romantic Sagas (3 vols., 2d ed. 1829—1830), an edition (from a manuscript), with philological critical remarks, of Ragnar Lodbrog's death-song, under the title of *Krákumál, seu Expeditum Regnerii Lodbrogi, Regis Daniæ* (Copenh. 1826); a complete collection of the Norse sagas (many of these MSS. being hitherto unedited) entitled *Fornaldar Sögur Nordlanda* (Copenh. 3 vols., 1829—1830); and the *Færeyinga-Saga* (1832) in Icelandic, with translations in Danish and Faroese, and a critical apparatus. But his most widely-known and perhaps his most interesting work, is his *Antiquitates Americanæ, seu Scriptores Septentrionales Rerum Ante-Columbianarum in America* (Copenh. 1837), in which, from a critical examination of numerous geographical, nautical, and astronomical data in certain Old Norse MSS., he came to the conclusion that America was discovered by Norsemen in the 10th c., 400 years before Columbus was born; and that, from the 11th to the 14th century, a large tract of the North American coast had been visited and even partially colonised as far south as Rhode Island and Massachusetts—a conclusion, it may be added, the probability of which has been by some assumed to be strengthened by recent topographico-antiquarian researches in these states. The subject was followed up by him and Finn Magnussen in their *Historical Monuments of Greenland* (3 vols., Copenh. 1838—1845). Another very important work to which Rafn furnished a great part of the text, carefully worked up from MSS., and a Danish translation of the first three and the 11th books in parallel columns, is the great collection of historical sagas representing events that took place out of Iceland, and entitled *Fornmanna Sögur* (12 vols.,

Copen. 1828, et seq.). He also had a great share in drawing up and editing the Icelandic MSS. relating to the history of Russia and other eastern countries, which appeared at Copenhagen in 1850—1852, under the title of *Antiquités Russes*. He died in 1865.

RAGGED SCHOOLS. The Ragged School is a voluntary agency providing education for destitute children, and so preventing them from falling into vagrancy and crime. Vagrant children, and those guilty of slight offences, are provided for in the English Certified Industrial School; but the two institutions are in Great Britain frequently combined. See article INDUSTRIAL SCHOOLS. The movement which established ragged schools was almost simultaneous with that which instituted reformatories. John Borgia, an unlettered labouring mason, established a 'ragged school' towards the close of the last century, composed of thievish and vagrant children, gathered from the streets and by-ways of Rome. A few years later, John Pounds, an uneducated cobbler, for 20 years, till his death in 1839, gathered into his shop the most destitute and degraded children of Portsmouth, and thus instituted the first ragged school in England. Both wrought miracles among the juvenile *gamins* of the street. The mental, industrial, moral, and religious training which they imparted to the juvenile generation of their time was a work most appropriately honoured as 'the beginning of the greatest of all social problems.' It saved thousands of children from beggary and vice, and raised multitudes from the verge of infamy to the rank of a useful and honoured life. The first school in which education was accompanied by offer of food was opened by Sheriff Watson in Aberdeen in 1841, and from thence ragged feeding schools spread over all the country. London had a ragged Sunday-school in 1838, which eventually became a free day-school. Field Lane followed in 1843. The Ragged School Union of London, in 1864, numbered 201 day-schools, with 17,983 scholars (of these, 2849 were industrial); 180 Sunday-schools, with 23,360 scholars; and 205 night-schools, with 8325 scholars. The number of schools throughout the country cannot be ascertained, as they are not officially known. A Privy-council Minute of 1856 allowed a capitation grant of £2, 10*s*. to every child fed in the schools. This was withdrawn in 1859, as was also the grant of one-third the cost of material used in industrial training. Many of the existing schools certified under the Act of 1857, as in Scotland under Mr Dunlop's Act of 1854, but these acts operated very slightly in changing the character of the schools, though introducing the principle of compulsory detention, more fully worked out under recent acts. In the present code of government education, ragged schools are left out. They can obtain grants on the same conditions as other schools—conditions to them often difficult and unnecessary. For industrial teaching, they receive nothing. The ragged school joined to the certified industrial is precluded from aid from any quarter. There are still, it is estimated, 25,000 ragged children in the streets of London. Schools for the instruction of poor coloured children were established by the Friends of Philadelphia as early as 1770, and their benevolent care has not relaxed, in this respect, for an entire century.

RAGGEE (*Eleusine corocana*), an Indian grain (see ELEUSINE), very prolific, but perhaps the least nutritious of the cereals, although it is the chief food of the poorer classes in Mysore and on the Neilgherries. It is made into dark-brown cakes and porridge, which are described as very poor fare.

RAGHU is, in the legendary history of ancient India, the name of a celebrated king of Ayodhyâ. See OUDE. He belonged to the royal dynasty which derived its origin from the sun; and amongst his descendants is Râma (q. v.). See also the next article.

RAGHUVANS'A (from *Raghu* [q. v.] and *vans'a*, race or family, hence 'the family of Raghu') is the title of one of the most celebrated poems of Sanscrit literature, attributed to the authorship of Kâlidâsa (q. v.). It consists of 19 sargas—i. e., sections or cantos—and its subject-matter is the legendary history of the kings of the solar race, beginning with that of Dilîpa, the father of Raghu, and ending with that of Agnivarn'a. The text of the poem, with an excellent Latin translation of it, was published by Professor A. F. Stenzler (London, 1832); the text, with a prose interpretation in Sanscrit, by Pandits of the Sanscrit College of Calcutta (1831); and the text, with the complete and important commentary of Mallinâtha, by Giris'achandra Vidyâratna, one of the professors of the government Sanscrit College (Calcutta, 1852). Single cantos with the same commentary have also been published at Bombay and Madras.

RAGLAN, LORD, FITZROY JAMES HENRY SOMERSET, Field-marshal, G.C.B., eighth son of the fifth Duke of Beaufort, was born September 30, 1788. He entered the army in his 16th year, and in 1807, served on the staff of the Duke of Wellington in the expedition to Copenhagen. He went to the Peninsula as aide-de-camp to the Duke, and in 1812 became his military secretary. As Lord Fitzroy Somerset, his name became a household word. He was present at all the great actions of the Peninsular campaign which illustrate the career of the great commander. He was among the first to mount the breach at the storming of Badajoz, and it was to him that the governor gave up his sword. On the return of Napoleon from Elba, he served under the Duke in Flanders, and lost his sword-arm in the crowning victory of Waterloo. The very next day, he was seen practising writing with his left hand! For his brilliant military services, he was made K.C.B., and received orders from several foreign potentates. He was minister-plenipotentiary at Paris in 1815, and secretary to the French embassy from 1816 to 1819. The Duke was appointed in 1819 Master of the Ordnance, and R. again became his secretary. In 1822, he went to the Congress of Verona in attendance on the Duke, who was the English plenipotentiary. In 1827, the Duke was appointed commander-in-chief of the British army, and called R. to the Horse Guards as his military secretary. This office he held until the death of his chief in September 1852. He was then made Master-general of the Ordnance, and in October was called to the House of Peers as Baron Raglan of Raglan, in the county of Monmouth. He had previously sat in the Lower House during the parliaments of 1818 and 1826 for the borough of Truro. While Master-general of the Ordnance, he was appointed, with the rank of general while so employed, commander of the English forces which were despatched to Turkey in February 1854. The allied armies of Britain and France, under R. and Marshal St Arnaud respectively, made good their landing in the Crimea. The victory of the Alma, the flank-march to Balaklava (q. v.), the cavalry charge which has made that place immortal, the sanguinary and desperate infantry-battle of Inkermann (q. v.) (which obtained for R. the baton of Field-marshal), and the siege of Sebastopol, are too well-known to need description. Unfavourable comments began to be made, as the campaign proceeded, upon R.'s conduct of the war. During the winter, 1854—1855, his soldiers suffered unspeakable privations, and hundreds perished in camp and on board transports for want of the food, clothing, and medicines

which were in store, but could not be found in the confusion and mismanagement that prevailed. Supplies arrived; but the siege continued without much apparent success until June 18, when a general assault was ordered, and when R.'s troops, as well as the French, received a terrible repulse. R. had been suffering from a slight attack of cholera, and the disaster of June 18 weighing upon his mind, he suddenly became worse, and died of exhaustion, June 28, 1855. His remains were brought to England, and buried in the family cemetery at Badminton. R. was an indefatigable and experienced administrator. He proved himself to be a skilful tactician, although it may be doubted whether he had the qualities of a great general. He was undeniably gifted with many qualities that shone with great lustre in the field as well as in council. His demeanour in action was so calm that it excited the admiration of the French, and Marshal St Arnaud declared that his bravery rivalled that of antiquity. His courteous and noble bearing, his gentleness of temper and firmness of mind, and his constant worship of 'duty,' invest his character with something of the chivalrous. See Kinglake's *Invasion of the Crimea*.

RAGMAN ROLL (*ragman*, a word of uncertain origin, used in ancient diplomatic language for an indenture or legal deed), the name given to the collection of instruments which record the acts of fealty and homage performed by the Scottish nobility and gentry to Edward I. of England during his military progress through Scotland in 1296, and afterwards at the parliament held at Berwick. The original instruments of homage under the seals of the parties were deposited in the Royal Treasury of England, and have almost entirely perished; but the roll in existence in the Tower preserves a record of them. Its contents were given in an abridged form in Prynne's *Records*, and afterwards printed *in extenso* by the Bannatyne Club in 1834. An especial value attaches to the Ragman Roll as containing the largest and most authentic enumeration extant of the nobility, barons, landholders, and burgesses, as well as of the clergy of Scotland, prior to the 14th c., and the only genuine statistical notices of Scotland of the period.

RAGOÛT (Fr. *ragoûter*, to revive the appetite; appears to be from Lat. *re-ad-gustare*), a name much less in use now than formerly, for a dish of stewed meat and vegetables, usually flavoured with herbs and other condiments. It differs but little from the olla of the Spaniards and the pilau of the Turks.

RAGS. Fragments of nearly all textile materials have now a commercial value; those of cotton, linen, and hempen cloths are used in the manufacture of Paper (q. v.); and woollen and worsted rags are made available for respinning either alone or mixed with fresh wool, whilst the refuse is ground into powder, dyed various colours, and forms the material called flock, used by the paper-stainers to produce their ornamental flock-papers. The trade in rags is enormous. Linen and cotton rags to the extent of 41,221 tons, valued at $3,139,000, were, in 1870, imported by American paper-makers, and perhaps quite as large a quantity is collected at home. The imports of rags into Great Britain, in 1869, were 17,021 tons, valued at £293,304, and of Esparto, &c., 89,081 tons, valued at £537,392; and in 1870 the imports of rags, Esparto, &c. amounted to 132,546 tons. See SHODDY.

Raguly.

RAGU'LY, in Heraldry, a term applied to an ordinary whose bounding lines are furnished with serrated projections.

RAGUSA (Serv. *Dubrovnik*; Ital. *Ragusa*), formerly an independent republic, now a decayed episcopal town and seaport of Austria, in the crown land of Dalmatia, lies at the base and on the steep slopes of Mount Sergio, 40 miles west-north-west of Cattaro. Its higher streets communicate with its Lower by means of flights of steps. It is surrounded on the land side by double walls, surmounted by old towers. Immediately south of the town is a harbour, which admits only small vessels; but two miles west is Gravosa, the proper harbour of R., and which offers secure and spacious accommodation to the largest vessels. The trade of R., which was once extensive and profitable, has sunk, and its inhabitants, 9000 in number (about a third of the former population), support themselves by shipbuilding, and by the manufacture and export of soap, liqueurs, maraschino wine, silk, leather, and tobacco. R. also carries on a considerable transit trade with Turkey by means of the Turkish caravans, about 200 of which—in all about 7000 horses—visit the town annually.

R. is supposed to have been founded in 656 by refugees from Old Ragusa (the ancient *Epidaurus*, situated 10 miles south-east), which was at that time destroyed by a tribe of Slavonians. It formed itself, after the model of Venice, into an aristocratic republic, governed by a rector. In 1358, it placed itself under the protection of Hungary, and later it became tributary to the Porte. Napoleon, in 1808, abolished the republican government of R., and incorporated the town with the province of Dalmatia. After 1814, the town, together with the province, came into the possession of Austria.

RAGUSA, an old town in the south of Sicily, in the province of Noto, and 30 miles west-south-west of the city of Syracuse, stands on a narrow and steep ridge between two ravines, on the right bank of the Ragusa, and about 15 miles from the sea. In the cliffs below the walls and around the town, ancient tombs of various shapes have been hollowed out. R. is supposed to occupy the site of the ancient *Hybla Minor*. Pop. 22,000, who manufacture woollen and silk goods.

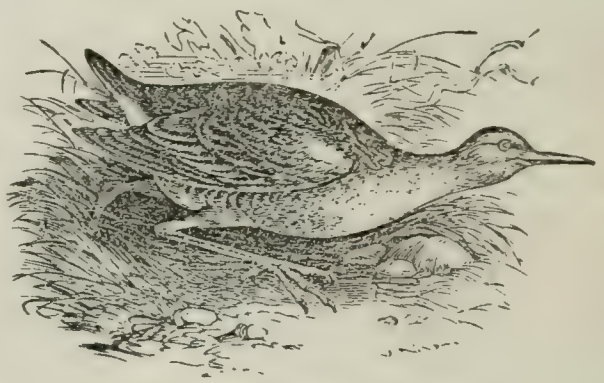
RAGWORT, the common English name of those species of *Senecio* (q. v.) in which the heads of

Common Ragwort (*Senecio Jacobæa*).

flowers have a spreading ray, the involucre has small scales at the base, and the leaves are pinnatifid. The British species are large coarse weeds,

with erect stem, and yellow flowers; one species, the COMMON R. (*S. Jacobæa*), a perennial, is too plentiful in many pastures. It is refused or disliked by horses, oxen, and sheep. It generally disappears from thoroughly drained land, at least after a little labour has been expended in grubbing up its roots. The fresh herbage has been used to dye wool green, but the colour is not permanent.

RAG-STONE, an impure limestone, consisting chiefly of lime and silica, much used in Kent. It breaks up into pieces about the size of a brick, and is hard and flat bedded. The name is also applied to the hard irregular rock which frequently overlies better building materials. Besides being used for building purposes, hones or sharpening stones for scythes and other large blades are made of it.



RAHDUNPU'R, a large fortified town of Hindustan, in a protected state of the same name, in the north-west of Guzerat, about 150 miles north-west of Baroda. The majority of the inhabitants, who are chiefly Rajputs and Coolies, are engaged in agriculture; trade and manufactures, however, are carried on to some extent. Coarse cotton cloths—the staple manufacture—and grain, leather, and hides are exported. Pop. 15,000. The state of R., which is under British protection, has an area of 850 square miles, and a pop. of 45,000. The climate, very hot during October and November, is delightful from December to April.

RÂHU is, in Indian Mythology, the demon who is imagined to be the cause of the eclipses of sun and moon. When, in consequence of the churning of the milk-sea, the gods had obtained the Amr'ita, or beverage of immortality, they endeavoured to appropriate it to their exclusive use; and in this attempt they had also succeeded, after a long struggle with their rivals, the Daityas, or demons, when R., one of the latter, insinuating himself amongst the gods, obtained a portion of the Amr'ita. Being detected by the sun and moon, his head was cut off by Vishn'u; but the Amr'ita having reached his throat, his head had already become immortal; and out of revenge against sun and moon, it now pursues them with implacable hatred, seizing them at intervals, and thus causing their eclipses. Such is the substance of the legend as told in the *Mahâbhârata* (q. v.). In the *Purân'as* (q. v.), it is amplified by allowing both head and tail of the demon to ascend heaven, and produce the eclipses of sun and moon, when the head of the demon is called *Râhu*, and his tail *Ketu*, both, moreover, being represented in some *Purân'as* as the sons of the demon *Viprachitti* and his wife *Sinhikâ*. In the *Vishn'u-Puran'a*, R. is also spoken of as the king of the meteors.—In Hindu Astronomy, R. is personified as the moon's ascending, and Ketu as the moon's descending, node.

RA'HWAY, a city of New Jersey, U. S., on the Rahway River, 5 miles from its mouth, and the New Jersey Railway, 19 miles west of New York. It contains numerous manufacturing establishments, a large proportion of which are for carriages. Pop. (1870), 6258.

RAIKES, ROBERT. See SUNDAY SCHOOLS.

RAIL (*Rallus*), a genus of birds of the order *Grallæ*, and family *Rallidæ*, having a slender bill, longer than the head, the body of a very compressed form, wings of very moderate length, a very short tail, long and strong legs, and long toes. The only European species is the COMMON R. or WATER R. (*R. aquaticus*), sometimes called *Bilcock*, a bird which occurs in almost all parts of Britain, and is not unfrequent in marshy situations and the reedy margins of lakes and rivers, although it often eludes observation, threading its way among reeds—for which its compressed form seems specially adapted—and diving when compelled to betake itself to open water. It does not rise, except in extreme necessity; and when flushed, flies heavily. It is more plentiful in most parts of the continent than in Britain; and is there generally a bird of passage, breeding in the north, and migrating southwards on the approach of winter. It makes its nest of coarse grass and sedges among thick aquatic plants. The whole length of the bird is about eleven inches and a half. The sexes are very similar in plumage, olive-brown, marked with black above; bluish-ash colour beneath, with white transverse markings on the belly. The water R. feeds on worms, molluscs, and soft vegetable substances. It is in the highest esteem for the table.—America produces a number of species of R., as the VIRGINIAN R. (*R. Virginianus*), a species rather smaller than the Water R. of Europe, and much resembling it in its habits; a bird of passage, and in many parts of North America very abundant; the GREAT RED-BREASTED R., or FRESH-WATER MARSH HEN (*R. elegans*), a much larger bird, fully 20 inches in length, inhabiting the extensive marshes of the southern states of North America; the CLAPPER R., or SALT-WATER MARSH HEN (*R. crepitans*), extremely abundant in the salt-marshes of the same regions, its whole length about 15 inches; all of which are much esteemed for the table, the eggs of the Clapper R. being also collected in great numbers as a delicacy. The name Clapper R. is from the cackling cry which the bird seems to delight in emitting.—The MANGROVE HEN (*R. longirostris*) abounds on the muddy shores of the West Indies, and its flesh is held in the highest esteem.—In general form, and in the character of

Water Rail (*Rallus aquaticus*).

their plumage, all these and other species are very similar.

RAILS, in Architecture, are the horizontal bars in panelled stone or wood work, such as doors, shutters, &c., which enclose the panels, the upright pieces being termed styles.—The word is also applied to the level piece over balusters or between posts.

RAI'LWAYS. The origin of these now vast undertakings is traced to a contrivance for simplifying the transit of coal from the mines in Northumberland and Durham to the places of shipment on the Tyne and Wear. The invention consisted of a double parallel line of wooden beams or trams fixed to the ground, and furnished with flanges to prevent the wheels of vehicles from slipping aside. Along these flanged beams wagons were drawn by horses with such comparative ease, that instead of a load of 17 cwt. by a common road, a load of 42 cwt. could now be drawn by a

single horse. These new thoroughfares, called tramways, were made across fields, the proprietors of which received a certain rent for the way-leave or use made of them—which term, way-leave, is still employed in arrangements of this kind. To the coal districts of the north of England, therefore, is indisputably due the simple yet meritorious contrivance which, from less to more, led to the modern railway, with all its wonderful machinery; nor is it useless to note, that the invention, in its early stages, owed nothing to men of education or high scientific attainments, but was mainly the work of obscure mechanics and illiterate enthusiasts.

The date of the invention of tramways is uncertain, but by good authorities it is referred to the period between 1602 and 1649. From the northern coal districts it gradually came into use in other mining districts in England, as also in the south of Scotland. The 17th c. was not favourable to mechanical improvement. Not till about 1700 was there any marked advance on the original tramway. The first step was the clothing of the wooden beams with long slips of iron, to prevent excessive tear and wear. This also being found defective, a second and more complete improvement, about 1740, was the substitution of cast-iron rails fixed in parallel lines on cross wooden sleepers. This species of railway became pretty general in mining districts between 1745 and 1775. In the former of these years, one was in operation in Scotland—namely, a short coal-line from Tranent to Cockenzie, which General Cope selected as a position at the battle of Prestonpans. Though now considerably improved, railways did not attract attention as being suitable for general traffic. The success of canals not only turned the public mind in that direction, but raised up a powerful canal interest, which viewed the progress of railways with extreme jealousy and ill-will.

The use of cast-iron rails led to an improved method of traction. Instead of employing a single large wagon, the plan of linking together a series of smaller wagons was adopted—the germ of the modern train. The next improvement consisted in putting flanges on the wheels instead of the rails, by which great facility of transit was afforded. The draught still continued to be executed by horses; but as the railway system seemed to possess immense capabilities of expansion, many minds laboured in devising schemes to substitute steam-apparatus. The invention of the locomotive, like that of railways, was the work of successive geniuses. Watt had shewn the practicability of fixed steam-engines; what was now wanted was an engine that would travel by its own internal impulse. The merit of inventing a self-acting steam-carriage is allowed to be due to Richard Trevethick, a clever but eccentric engineer. In 1802, he took out a patent for a steam-carriage, and this novel machine he exhibited to large crowds of admiring spectators on a piece of ground near London. Immediately afterwards, he adapted his carriage for the drawing of wagons on railways, a duty which it successfully executed on the Merthyr-Tydvil Railway in 1804. This was the first locomotive; but it was far from perfect. It drew only 10 tons of bar-iron at the rate of five miles an hour. Trevethick did not remain in England to improve on his invention, nor did the moderate achievements of his machine immediately induce others to make any distinct advance on his ingenious contrivance. For this lethargy there were various causes; but the principal consisted in a universal belief among engineers, that the locomotive could not be expected to gain great speed, to ascend a moderate incline, or to draw a heavy load, unless the wheels were provided with a cogged rim to work on a corresponding rack along the rails. Similar schemes were made the subject of patents to overcome this imaginary difficulty—a circumstance which gives one a poor opinion of the state of engineering knowledge at the beginning of the 19th century. That locomotives running with smooth wheels on smooth rails, by mere weight and friction, as employed by Trevethick, could draw heavy loads up a moderate incline, was at length, in 1811, established as a fact by Mr Blenkinsop, a coal-proprietor on the Middleton Railway. The means for imparting speed were remained to be given.

Locomotive power was employed by George Stephenson (*q.v.*) on the Killingworth Railway in 1814, and with such success that it was afterwards applied on the Stockton and Darlington Railway, for which the first act of parliament was passed in 1821. In this last undertaking, Stephenson, encouraged by the generous and enlightened zeal of Edward Pease, a member of the Society of Friends, whose name will always be associated with the history of railway enterprise. The Stockton and Darlington was the first railway on which carriages travelled with passengers; yet, even with the pleasure of success so secured, the locomotive was still an imperfect machine, for its rate of progress continued to be little faster than the walk of a horse. Acceleration was now the grand desideratum, and it was attained by using a very simple contrivance—that of sending the waste steam up the chimney, so as to cause a powerful draught in the fire, a rapid generation of steam was the consequence, and by this appliance, along with the multitubular boiler, the machine shot forward with an energy hitherto unknown (see STEAM ENGINE). Certain improvements in details only remained to be effected, and these were carried out at Stephenson's engine works at Newcastle; the greatest improvement of all consisted in that nice adjustment of parts, which is now observable in the mechanism of the locomotive.

It certainly seems very strange, that notwithstanding the proved feasibility of railways, the public at large could not be stimulated to give any heed to the subject. It was shewn in this, as in the analogous case of steam-boats, that the world may remain sceptical of an invention long after it has been practically established beyond cavil. The idea of extending railways over the kingdom for general traffic, was perhaps first conceived by Thomas Gray of Nottingham, who, full of enthusiasm, besieged the public, and memorialised the government on this his favourite project, between 1820 and 1824. A work, embodying his views, *Observations on a General Iron Railway, &c.*, was published in 1820. Gray's ardent notions met with little favour. Unfortunately, he was no mechanic, and, seemingly unacquainted with the advances which had been made, laboured under the old exploded belief, that locomotives must have cogged wheels. After Gray, there appeared another projector, William James of London, who, in 1822, endeavoured, without success, to establish a railway between Liverpool and Manchester. Opposition caused his plans to be laid aside. The next and more fortunate projector was Joseph Sanders of Liverpool. He issued the prospectus of a railway from Liverpool to Manchester, 29th October 1824; and this line, surveyed by Stephenson, was, after much unworthy opposition, and some changes of route, sanctioned by the legislature. It was formally opened for traffic, September 15, 1830. Provided with some of George Stephenson's improved locomotives, the success of the line was immediate and complete—in fact, the great railway system was inaugurated.

Now, properly speaking, began that course of commercial enterprise, unregulated, and often wasteful, which has since assumed such importance. Refraining from all control over railway operations, the government left speculators to carry lines anywhere or anyhow that parliament could be persuaded to sanction. The result, as is well known, has been in many places a complication of competing lines on no principle of economy or enlightened foresight. Abandoned, as it were, to the audacity of promoters, and the mere brute force of capital, schemes, good, bad, and indifferent, had to fight their way at a cost almost exceeding belief; while at the same time there has been much waste of money in allowing circuitous lines to places which are afterwards, in a great measure, superseded by others more direct.

Legislation and Management.—In the United Kingdom, railways are the property of independent companies, who construct and work them under the provisions of acts of parliament. The first step consists in organising a company. Generally, a solicitor and a few active projectors draw up a prospectus, call meetings, suggest the names of directors, and appoint an engineer to make a survey. In no case does government or any public body take any part in the initiatory proceedings, or find any part of the capital. In some instances, the land proprietors in the district to be traversed and benefited, are among the principal promoters, but for the greater part, the scheme is got up by individuals who can plead no such inducements. By the engineer and solicitor, there is much to be done at the outset. Having procured a copy of the survey, the solicitor has to discover the name of every proprietor whose land is interfered with, as well as every tenant or occupant; all which names, with the extent and nature of the land to be taken, are entered in a roll, called the *Book of Reference;* and with every person so concerned, a schedule must be lodged, stating all particulars. The recipients of the schedules are requested to state in reply, whether they design to assent, to oppose, or to remain neuter; by which means, the mind of every one territorially interested becomes known to the promoters. Land to be taken for, or damaged by, railways is valued under different categories: 1. The quantity and quality at so much per acre; 2. The injury caused by cutting off one part of a field from another, called intersectional or severance damages; and 3. The damage done to the amenity or beauty of the place. Besides claiming compensation on these different grounds, the proprietor demands, for the sake of convenient communication, that bridges or level crossings shall be made across the line, or that passages be left beneath it; also that all ordinary means of drainage be maintained by culverts. Sometimes, he stipulates for a siding or station. Should the lands be let to a farmer, as is very generally the case, he is treated with separately for the loss he is likely to sustain during his lease, including any loss by unexhausted manure in the lands appropriated. Being thus compensated for his claims, the farmer continues to pay his rent as usual, without deduction, according to the obligations of his lease, and any question is saved between landlord and tenant. Such is an outline of the usual method of settling 'land-claims,' though much depends on the feeling on both sides. At one time, enormous sums were asked, and paid for alleged damage to land; now, the claims are more moderate, and in few instances is damage to amenity an element of consideration.

Until a statutory enactment is procured, the shares of a company are in that embryo state called *scrip.* Allotted to applicants by the provisional directors, the shares are 'taken up' by paying a small instalment, of from 5*s.* to 20*s.* per share. These preliminary sums are paid in to a specified bank, the receipt of which is the scrip or certificate that so frequently becomes the subject of eager transfer among jobbers. The bank deposits of the allotters constitute the fund from which are paid—1. Expense of survey; 2. Expense of advertisements, prospectuses, &c.; 3. Parliamentary expenses; and 4. The amount to be lodged with an officer of government as a guarantee that parliament shall not be troubled with a merely pretended scheme. Should the bill not pass, the sum last mentioned is returned, and is, along with any residue, divided *pro rata* among the holders of scrip. Should the bill become law, scrip-holders are required to present their names with the amount of their respective shares for register at the office of the secretary of the company. 'Calls' are next made on the shareholders. If the shares be £10, a call of £2, 10*s.* per share, at intervals of three months till the whole is paid, is customary. Any failure to pay calls by a prescribed day incurs the risk of forfeiture. In authorising a company, parliament gives power to raise so much money by shares, and so much by borrowing. The amount that may be borrowed is equal to a third of the stock, but it cannot be legally borrowed until all the shares have been issued, and at least one-half of all the shares have been paid up. The lender has a mortgage over the whole property of the company, called a Debenture (q. v.). The entire amount paid for shares and borrowed on mortgage forms the 'capital account' of the company. See Capital Account, in which an explanation is offered of the manner of disbursing from capital and also from revenue; it being from revenue alone that dividends can be legally paid.

The act which authorises the undertaking constitutes the company a corporation, the members of which are responsible only to the extent of their respective shares. In the act, the names of the first directors are given; it is also stated who are first to retire, and how elections are to be conducted. A director must possess a prescribed amount of stock. The directors are empowered to appoint from their number a chairman and deputy-chairman. They likewise have the appointment of secretary, traffic-managers, and other paid officials. The directors themselves profess to give their services without any species of remuneration; but the shareholders usually vote a small sum to be put at their disposal, adequate to meet absolutely necessary expenses. Where the duties are very onerous, a special allowance per annum is voted to the chairman. It is likewise customary for the directors to have free passes over the line, which privilege is also enjoyed by the secretary and some other officials. In some instances, a free pass for a day is given to the shareholders to enable them to attend the stated half-yearly or special meetings. The principal business at the half-yearly meetings is the reading and approval of the 'report' of the directors. As the report is always printed and circulated previously, all are prepared to discuss its merits. Shareholders seldom oppose the approval of the report, and still more rarely are they successful when they do so—the integrity and discretion of directors for the most part justifying confidence in their management.

The organisation of the present railway system has not depended on the private acts authorising the several undertakings. There is now a body of general railway law, springing from a number of public acts, which have from time to time received the grave consideration of the legislature. These

statutes date from 1838 till 1864; some of the more important were passed in 1845; among these were several comprehensive statutes, including 'The Companies Clauses Consolidation Act,' and 'The Companies Clauses Consolidation (Scotland) Act;' also 'Railway and Lands Clauses Consolidation Acts;' to which supplementary acts were added in 1863. (See *Hand-book of Railway Law*, by A. Moore.) Among the diversity of matters treated of are as follows—obligations as to carrying mails, and conveyance of troops and police; regulations as to gates at level crossings, signals, and junctions; penalties for obstructing engines or railway officers, and trespassing on lines; limitations of gradients and curves; gauge; time within which railway must be made; notices to be given to Board of Trade before line can be opened, and not to be opened without authority, after due examination of works; returns to Board of Trade as to accidents; maintaining of fences; making of sidings for farming and other purposes; one cheap train to be run each way daily; rules for registering and transferring shares; voting according to ratio of shares held; payment of poor-rates and public assessments; leasing of lines; agreements to work lines; surrender of shares; authority to buy, hire, and use steam-vessels; &c.

Besides these public acts, there is a code of regulations as regards the mode of commencing and carrying railway bills through the Houses of Parliament. This code, embodied in a work issued annually, is styled *Standing Orders of the Lords and Commons relative to Private Bills* (1 vol. 12mo, issued by Waterlow and Sons, Westminster). With this, all parties engaged in procuring railway acts require to be well acquainted, for neglect of any of the prescribed forms is almost certain to be fatal. We give the following as specimens of 'Standing Orders:' Notices of applications for acts to be advertised in October or November; plans, sections, and books of reference to be lodged with clerk of the peace or sheriff-clerk of county for public inspection, on or before 30th November [often an immense struggle up till last moment to get this done]; petitions for act stating particulars to be lodged at the Private Bill Office of the House of Commons on or before 23d December; on or before same date, copy of proposed bill to be lodged with Board of Trade; on or before 31st December, declarations, lists of owners, lessees, and occupiers, also estimate of expense, to be deposited in Private Bill Office; a sum not less than eight per cent. of the estimated expense to be deposited with the Court of Chancery, England, an officer of the Court of Exchequer, Scotland, or Court of Chancery, Ireland, previous to 15th January; examination of petitions to commence on 18th January; if promoters do not appear after a notice of seven clear days, examiners may throw out petition; certification by examiners whether standing orders have been complied with; bill submitted to select committee; proceedings in opposed bills; report of Board of Trade on bill; report of Board of Admiralty on bill, should any tidal or navigable river be proposed to be interfered with; preamble of bill proved or otherwise; bill to give power for future revision by parliament, &c. There are equally explicit standing orders as regards the House of Lords, whose chairman of committees subjects all private bills to a sifting examination. Whatever, therefore, may have been the negligence of the government at the outset, railway legislation has latterly received a painful degree of attention. As marking a desire for simplifying procedure and lessening expenses, parliament passed an act, 1864, giving the Board of Trade power to authorise bills for a smaller class of railways, provided they were unopposed—a concession which may promote a minor but useful kind of branch lines.

In [illegible] the prospectus of a railway, an estimate is given of the probable amount of traffic of all kinds, but in every case, sometimes to a surprising degree, the traffic exceeds expectation. Railways have not improperly been compared to navigable rivers. To inland and not easily reached towns, they impart the character of a seaport, placed in ready communication with all the world. The exciting of a desire to travel, and the developing of local trade and resources, accordingly bears on railway undertakings, and the consequence is a universal activity and prosperity. So fully is this known, that landed opposition to railways has disappeared among the landed gentry, and the impression now is, that the greater number of existing common roads are destined to be superseded by these iron highways.

Railways were at first detached undertakings, between one large town and another; but now many of the companies have for mutual advantage amalgamated in groups, and in a number of cases, for economy in working, lesser lines have been leased to companies of larger means. In this, as in most other commercial concerns in Great Britain, the tendency is to concentrate business in the hands of monopolists possessing large capital, or at least those having a great capacity and disposition to borrow. One of the advantageous results of a union of railway interests is, that passengers are able to procure 'through tickets' to carry them forward for hundreds of miles without delay or change of carriage; but it is not less conspicuous that the 'railway interest' has become a formidable power in the state, and is able to carry lines almost anywhere, in disregard of land-proprietors or town-authorities, as if the destruction of rural amenity and the wholesale ruin of dwellings were matters of perfect indifference. Making every allowance, therefore, for the high social value of the railway system, it has certainly reached a point of dispotic overbearance that requires some species of control more effectual than that which is embraced in the irregular action of parliamentary committees or of the Board of Trade.

Construction.—Railways in the United Kingdom are of two kinds—double and single. The double consists of two lines of rails—an *up*-line, conducting towards, and a *down*-line, leading from the metropolis or principal centre of traffic. By far the larger number of lines are of this double variety. Single lines, with places where trains may pass each other, are mostly of recent construction, and have received their chief development in Scotland. Whether double or single, all the lines are enclosed by fences—stone-walls, palings, hedges, or stretches of wire. At the chief terminus, there is a group of buildings for offices, workshops, sheds for locomotives, &c. Along the lines, there are stations at distances of two to ten miles. At the termini and stations, there are raised platforms for the accommodation of passengers. The principal stations are under cover, and are provided with waiting-rooms. When lines pass through a town, they are carefully secluded. Recently, there have been great improvements as regards fixed signal-posts, and the processes for shunting trains.

The construction of a railway is the business of contractors, who execute the works by estimate, according to the plans and specifications of the engineers. A railway contractor is a specialist with a practical knowledge of earth-digging, blasting rocks, pumping, embanking, boring and building tunnels, erecting bridges, and other [illegible] operations. He possesses a stock of wheelbarrows, carts,

and shovels, carts, earth-wagons, horses, light rails and sleepers for temporary purposes, and other professional machinery, including one or more locomotives for dragging materials. Acting himself as commander-in-chief, he has subordinates called time-keepers, foremen, gangers, and under-gangers, placed over detachments of operatives. These operatives are a remarkable class of men. Originally from Lincolnshire and Lancashire, they are popularly known as *navvies*, from having been engaged in excavating navigable canals. The genuine navvy is an interesting specimen of a strong-built, hearty, industrious, and illiterate English rural labourer; his dress, a round felt-hat, coloured plush waistcoat, loose flannel jacket, corduroy breeches, and laced quarter-boots—appetite for beef, fried ham, and ale immense. With muscular strength corresponding to his appetite, the navvy is a proficient at using the pick, shovelling earth, and handling a wheelbarrow, which, with a load of one to two hundredweight, he trundles along a plank, and tips over with uncommon dexterity. Navvies sometimes labour in bands, called *Butty gangs*, by piece-work, and are known to draw large sums, but more generally they are employed at days' wages—their time being kept by a clerk to ensure steadiness of work. At a distance from towns, they and their families live in rudely-constructed huts, near which is placed a store, for the sale of articles they may require. Their pay-day is usually every fortnight, on which occasion much of their earnings is heedlessly dissipated, and sometimes serious brawls, calling for the interference of the police, occur on these occasions. It has been stated on good authority, that a sum equal to £1000 per mile on all the railways in Great Britain, has thus been wastefully squandered by navvies.

Curves and Gradients.—Engineers endeavour to render their lines as level and straight as possible, but circumstances often necessitate the use of considerable curves and gradients. As a general rule, there are few curves of less than three-eighths of a mile or 30 chains' radius; when they are employed, the exterior rail is super-elevated, to counteract the centrifugal force, otherwise a quickly moving train might leave the rails. Gradients being expensive to work according to their degree of inclination, few are more steep than 1 in 60, though 1 in 30 is not unknown. When the gradient is steeper than this, stationary engines are usually employed.

Gauge and Earth-works.—In the early stage of railway operations, the gauge or width between the rails excited considerable discussion. When way-leaves, or tramways, were introduced in the coal districts, their gauge was adapted to the common road-wagons that were to be put upon them, and it happened that the gauge between the wheels of these wagons was 4 feet 8½ inches. Accustomed to this width, George Stephenson believed that it 'was most economical in construction, not only as regarded the engines and carriages, but more particularly of the railway itself.' This gauge was accordingly adopted on most of the earlier-made railways, and, notwithstanding the keen contests of engineers, who were generally favourable to a 5 feet or 5 feet 3 inches gauge—Brunel contending for 7 feet—this original 4 feet 8½ inches gauge—measured from the inside of one rail to the inside of the other—was irrevocably fixed by a public act, 1846, as applicable to all the railways in England and Scotland, the Great Western and certain branches excepted, on which the gauge was regulated at 7 feet. By the same act, the gauge in Ireland was fixed at 5 feet 3 inches—a width now understood to be greatly preferable to the narrower gauge, as admitting of better passenger accommodation, with a lower and more safe centre of gravity. The government of India has fixed the gauge of all the railways in that country at 5 feet 6 inches. A space of 6 feet is ordinarily allowed between the up and down lines of rails, making the entire breadth of way, including the thickness of the rails, 16 feet. From both sides, there is a slope of 18 inches deep, to drain off the water that may fall on the line; and at the foot of this slope, a narrow level strip is allowed for a pathway, to accommodate 'plate-layers.' The average breadth of 'formation' is 18 feet for a single, and 28 feet for a double line. If upon an embankment, there is a slope from the pathway to its base. As the sides of embankments and cuttings are neatly dressed off, and if practicable, sown with grass seeds, English railways have a carefully executed and trim appearance.

Ballast.—This is the name given to the mass of broken stones or dry gravel on which the sleepers are placed, and which serves to keep them steady. Material for ballast is generally got in the cuttings or near the line, but is often brought a considerable distance. The term *ballast* originated in the practice of using the gravel-ballast emptied from the ships in the Tyne, for the tram and railways in the neighbourhood of Newcastle.

Rails.—All the rails are of malleable iron—cast-iron not being now tolerated—but steel-rails are coming into use, where there is a continuous heavy traffic. The rails differ in shape and weight. The most common form is that of which we present a section, fig. 1; for bridges and the wide gauge, where longitudinal sleepers are employed, the form, of which there is a section (fig. 2), is preferred. Cross-sleepers are laid at usually 3 feet or 3 feet 6 inches apart. On these sleepers the *chairs* of cast-iron are fixed, and the rails set in their place on the chairs, are held firmly down by iron spikes. The ends of the rails are now almost always joined together by a massive plate of malleable iron placed on each side called a fish-plate; two of them are used at each joint, and are bolted together by four strong bolts passing through the rails. In the joining of the rails end to end, to make a smooth surface, great care is bestowed; perfect steadiness in the required line of direction is secured by means of wooden wedges acting on the rails and the chairs. In the adjoining cut, fig. 2, are represented two rails, A,

Fig. 1.

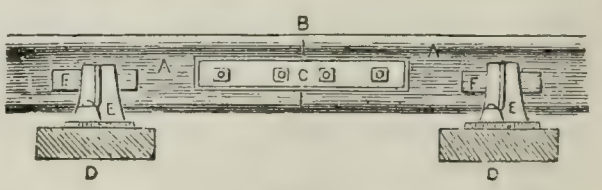


Fig. 2.

joined end to end at B, held fast together by the fish-plate C. The sections of the wooden sleepers are shewn in D, D, on which are the chairs E, E. The wooden wedges are marked F, F.

Hitherto, the sleepers have been of seasoned native larch, as the most durable, but latterly, from the growing scarcity and cost of this article, sleepers have been made of imported timber from ports in the Baltic. Such imported timber requires to be *creosoted*. Many patents have been taken for rails which, from the peculiar size of the lower flange, dispense with sleepers entirely, but none have found much favour; of late a cast-iron sleeper, very much

the shape of a pot lid, having the chair cast on the top, has been much used by English engineers on railways abroad, and even at home where timber is scarce, and the ballast of a sandy nature, and has given much satisfaction in India and elsewhere.

Tunnels and Viaducts.—Tunnels are avoided as far as possible, for, besides their costliness, they, if long, necessitate the constant use of lamps in the carriages. They are made only when the excavations would be more than 60 feet in depth, or when land proprietors force their adoption, in order to spare the amenity of grounds near a mansion. For this latter reason, some short tunnels are known to have cost railway companies as much as £50,000. Latterly, the execution of underground railways in the metropolis has offered examples of tunnelling more extensive than were previously known in England, and at the same time popularised a method of subterranean transit almost as marvellous as anything in the way of viaducts across wide and profound chasms. As regards viaducts, they consist of stone bridges of handsome architecture, or as commonly of malleable-iron girders of various forms set in stone piers. In the construction of these stone and iron viaducts, there is a growing boldness of conception, arising not only from the success of the famed railway viaducts across the Menai Straits, the river Tamar, and the St Lawrence, but from the greater experience and skill of engineers.

Cost of Permanent Way.—Owing to the obstructions offered by landowners, and their excessive claims for amenity damages, also the opposition of rival companies, the cost of railways was at one time very much greater than it is at present. The expenditure incurred in securing legislative authority to construct railways, was likewise enormous. The parliamentary costs of the Brighton Railway averaged £4806 per mile; of the Manchester and Birmingham, £5190 per mile; and of the Blackwall, £14,414 per mile! The cost of carrying the Liverpool and Manchester line was £27,000. It has been shewn that the solicitor's bill for the South-eastern Railway contained 10,000 folios, and amounted to £240,000. These few facts, however, afford but a feeble idea of the reckless wastefulness of capital on railway undertakings; it is universally allowed that, under a better policy, not only a much better railway-system might have been provided, but a saving effected of at least fifty millions.

In ordinary cases, railways with a double line are constructed in England at a cost of £12,000 per mile, station-houses, signals, and all other fixed plant included. Single lines are made at perhaps a fourth less, but nowhere in the United Kingdom have they been executed so economically as in Scotland. There, some single lines have cost for land and everything not more than about £5000 per mile—such economy, however, being greatly due to the fact that the undertakings were promoted and watched over by bodies of land-proprietors deeply interested in restraining expenditure. Of these cheap Scotch lines a good example is offered by the Peebles railway (practically a branch of the North British), extending to 18¾ miles, the entire cost of which, land and station-houses included, was about £95,000. The cost of rolling stock was additional. This economically-constructed line, managed with a scrupulous attention to details, under the care of directors (mostly land-proprietors) who have ever given their services gratuitously, has latterly been paying a dividend of 6 per cent. per annum on its ordinary, and 5 per cent. per annum on its preference, shares.

Maintenance of Way.—Every railway, great or small, is at a considerable expense in keeping the line in proper working order, for which purpose a staff of officials is required. Besides a general superintendent there is an efficient staff of 'plate-layers,' whose duty it is to watch over the permanent way, to make small repairs, and to report to the superintendent if anything is seriously deranged. The number of plate-layers on a given piece of road should not exceed three men to each two miles. To stimulate their vigilance, a reward of 5s. is, on some lines, given for every broken rail that is properly discovered. Plate-layers' cottages are erected at convenient distances along the railway. In some instances, the cottage adjoins a level crossing, at which gates have to be kept shut across the line to admit the passage of carts, horses, &c., and opened only when trains give the signal of approach; in such cases (mostly on small lines, where economy is studied) the plate-layer's wife is constituted 'gate keeper.' Latterly, parliament has been reluctant to allow level crossings; and these are now chiefly confined to by-ways or parish roads with little general traffic.

Rolling Stock.—Under this head are comprehended locomotives, carriages, and trucks for goods and minerals, the whole forming an important part of railway undertakings.

Locomotives.—These are of various kinds—four-wheeled and six-wheeled, according as small or large machines are desirable for the traffic. In some varieties, the tender for fuel and water forms an extension of the locomotive, such being called 'tank engines,' but for the most part the tender is detached, and only connected by couplings. The cost of a six-wheeled locomotive of the best class is about £2500.

Carriages.—There are three distinct kinds of carriages to suit the several classes of passengers, the only variation being when a carriage comprehends first and second class compartments. A first-class carriage consists of three distinct compartments, like three coaches united. The compartments are in some cases fitted for six passengers, three on each side, sitting face to face; in other cases, eight are accommodated; but in any case one half the passengers sit with their back, and the others with their face, to the locomotive. The cost of a first-class carriage with three compartments, as shewn in fig. 3, is about £600. The carriage here represented

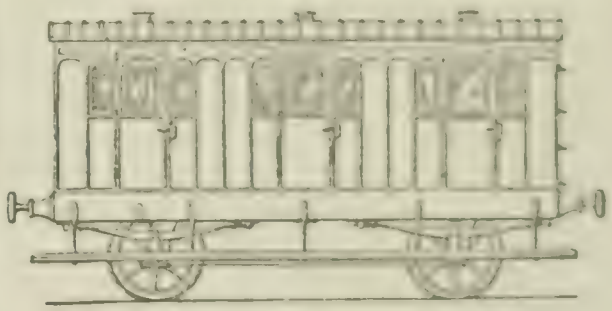

Fig. 3.

is of the newest style of construction and embellishment. Exteriorly, the body of the carriage is of light-coloured wood varnished. The windows are of plate-glass, and each compartment is lighted with a lamp at night, or when tunnels are to be passed through. The tops of the three lamp-covers are seen surmounting the roof. A foot-plank for the guard extends on each side, level with the axles of the wheels. On some railways there are 'saloon carriages,' which are of a spacious and splendid character, for the accommodation of royalty.

Wagons and Luggage Vans.—To accommodate its traffic, every railway must be provided with a

large stock of trucks or wagons for carrying goods, minerals, cattle, timber, and other articles. The

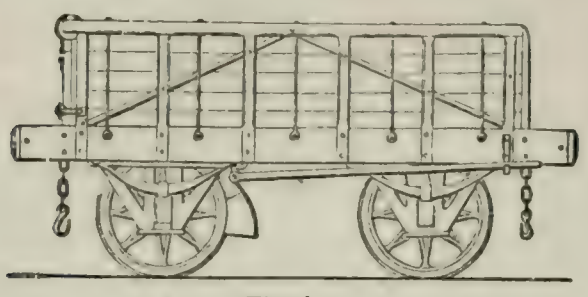

Fig. 4.

ordinary English coal-wagon is pictured in fig. 4, and the closed luggage-van, with a seat for the guard, in fig. 5. Trucks for carrying timber are

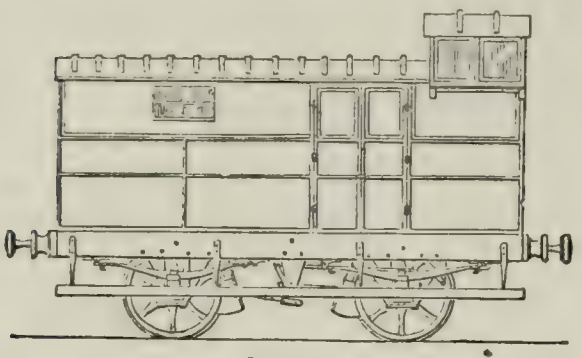

Fig. 5.

usually shallow in the ledges, and furnished with swivel bars, on which the timber rests.

Traffic.—The traffic on railways is of two distinct kinds—passengers and goods; with the goods we include minerals, also timber and other bulky articles. The passenger and goods traffic are placed under separate managements. Usually, there are passenger-trains and goods-trains. As minerals are carried on trucks without spring-buffers, it is inconvenient and damaging to unite them to passenger-carriages.

In every part of the United Kingdom, railway passengers are of three classes—first, second, and third. For the first and second, there are distinct carriages or compartments of carriages; for the third, the carriages are always distinct. The first-class compartments are handsomely fitted up with stuffed cloth seats and backs, are provided with straps for sustaining hats, a netting for umbrellas and small packages, and in winter they are furnished with long-shaped tin vessels of hot water for the feet, which vessels are renewed at certain points in the journey. Though from the fares charged, first-class carriages possess an air of exclusiveness, no more objection is popularly taken to them than to the use of boxes in theatres; and, indeed, they are universally recognised as an advantage, for the reason that by the comparatively high fares exacted for them, the companies are enabled to lower the charges for second and third-class passengers. On some lines, first-class compartments are set aside for ladies, if they please to use them. In none of the ordinary carriages is smoking allowed; but on a few lines, as in Germany, there are compartments for smokers. The first-class passengers have distinct waiting-rooms at the termini and stations, with generally a waiting-room in addition for ladies; for the second and third class, there is a waiting-room in common. The several waiting-rooms are neatly fitted up, and provided with suitable conveniences, including basins and water for washing the hands—accommodations which contrast favourably with what were furnished to travellers in the old coaching establishments. The waiting-rooms are open all day to the public, and there is seldom any restriction as to going on the platforms. Tickets are sold at a wicket not earlier than a quarter of an hour before the starting of the train. At the larger termini, there is a wicket for the first, and a wicket for the second and third, class. The tickets, marked in consecutive numbers, are stamped with the date on delivery, and excepting 'return tickets,' will not answer for any other day. Return tickets at a fare and a half are issued on most lines for the date of issue, or from Friday till Monday. On most lines, monthly, three-monthly, and season tickets are issued for first-class, not transferable, at a considerable reduction on ordinary fares. To encourage the building of villas at a distance of ten to twenty miles from termini, by which means a traffic may be developed, some companies give a personal ticket free for a number of years corresponding to the valued rental of the villa. For example, the builder or first occupant of a villa valued at £45 per annum, will receive a ticket for three years (taking him, if he pleases, daily, by all the trains during that period); if valued at £60, a ticket for five years. Much permanent traffic has in this manner been created in the neighbourhood of London.

The number of trains run daily depends on the pleasure of the directors. There are ordinary, mail, and express, trains; of this last kind, two usually go each way daily, the fares on which are higher than by the others. Ordinary fares are about $2\frac{1}{2}d.$ per mile first class, $1\frac{3}{4}d.$ second class, and $1d.$ to $1\frac{1}{2}d.$ third class; but on some lines the fares are considerably lower. According to one of the provisions of a general act, all companies must run one train daily each way, stopping at all stations, and at a rate of speed not less than 12 miles per hour, at a fare of a penny a mile. Children under three years of age going with passengers are free, and those from 3 to 12 years pay only half-fare. With few exceptions, the companies run two passenger-trains each way on Sundays, as far as possible avoiding the hours of divine service. By an act, 5 and 6 Vict. cap. 79, there is payable to government 'a duty at and after the rate of £5 per £100 upon all sums received or charged for the Hire, Fare, or Conveyance of all Passengers.' By 7 and 8 Vict. cap. 85, it is enacted that no tax shall be levied on the receipts for passengers conveyed at fares not exceeding one penny per mile; but by the 26 and 27 Vict. cap. 33, it is enacted that this exemption shall only extend to trains running six days in the week, or on market-days for the conveyance of passengers at one penny per mile. From this passenger-tax, Ireland is exempted.

All passenger-trains are accompanied by a 'guard' or conductor—the official who is charged with the responsible duty of conducting the train according to certain printed regulations, of which he possesses a copy. For the most part guards are intelligent and obliging persons, who do all in their power to render service to the passengers, within the prescribed rules. Nor must it be omitted, that although fees to any of the railway servants are strictly forbidden, the porters on duty are remarkable for the trouble they take to carry luggage, find cabs at the termini, and to answer civilly such inquiries as may be put to them by strangers. It may be said with perfect justice, that in no department of affairs in Great Britain is there seen such readiness to oblige as in that connected with railways. Considering, also, the vast number of

servants on some lines—the number on one line and its affiliated branches being 20,000—the general good conduct that is shewn, and the few accidents that occur, constitute a gratifying social phenomenon. The guard, porters, and some other officials wear a neat and distinctive uniform.

According to English routine, passengers are allowed to find their way promiscuously to the proper carriages, the only check being a call by the guard to 'shew tickets' previous to starting. At the termini, on closing the journey, tickets are collected by the guard; at the intermediate stations, tickets are given up to a porter at the exit wicket. All passengers are expected to see their luggage labelled for the place of destination, and to point out what belongs to them on arrival. This is a loose practice, often remonstrated against, but it suits the temperament and self-relying habits of the people. Amidst the crush of traffic and with little time to spare, the formalities of the continental system would be unendurable. Should labelled packages, consigned to the porters and guard, be lost, recourse lies against the company. Passengers may place small portions of luggage below their seats, but for these the company is not accountable. At the termini of the principal lines, and at important stations, there are refreshment rooms or stalls, for the most part well provided with materials for breakfast, lunch, and dinner. On the London and North-western line, and perhaps on others, there is a practice convenient to travellers. The guard asks who intends to dine at a particular place, and telegraphs the fact to the keeper of the dining-room, who has everything ready accordingly at the proper moment. At all the chief stations there are stalls for the sale of time-tables, newspapers, and small books of an amusing kind. See BOOK-TRADE. The sale of morning newspapers is so very considerable, that some of the first-class carriages assume for a time the appearance of a reading-room.

One of the good features of British railway transit is accuracy in starting and arriving at the prescribed time, a circumstance proximately owing to the vigilance of the guard and his strict attention to the rules of the company. Another peculiarity consists in the privacy secured to passengers while on their journey. Instead of being intruded on as in the American, Swiss, and some other railways, by the constant perambulation of the guard through the train, they are left unmolested to read, talk, or sleep, according as fancy may direct. This very seclusion, however, is thought to be attended with a disadvantage—namely, that passengers are unable to call for the assistance of the guard in cases of threatened outrage by one of their number. Latterly, there has been much newspaper discussion on this point, and various projects have been suggested for summoning the guard, and, if need be, arresting the progress of the train. To all devices of this kind there is unfortunately the grave objection, that if passengers were enabled to call the guard at pleasure, they would frequently do so for no sufficient reason, as whim or imaginary fear prompted; also, that the unexpected stoppage of trains would seriously derange the keeping of time, and in many lines jeopardise the safety of the whole of the passengers. Seemingly, it would be difficult to fall upon any plan free of this species of objection, unless recourse be had to the American construction of carriages, and the free perambulation of the guard through the trains—a remedy which involves a revolution in English railway transit, as well as in English feelings and manners.

To enable companies to reckon easily with each other as regards intercommunication of traffic in passengers, goods, use of carriages, &c., an institution called the Clearing House has been established in London to which tickets are transmitted for cross-checking and settlement. There is a similar establishment in Dublin. See CLEARING HOUSE.

Cost of Working.—The cost of working railways, including general expenditure, in Great Britain amounts to from 48 to 50 per cent. of the returns from traffic. The remainder forms the divisible profit to pay—1st, the interest on debentures, and 2d, the dividend to shareholders. Of these shareholders, some, as defined by statute, have a preference claim of 5 per cent. per annum, what is left over being divisible among the ordinary or original shareholders. In the general expenditure of railway companies is included the outlay for passenger tax, also police, poor, and parish rates. Considering that railways protect the property in every district which they traverse, it certainly seems a kind of hardship that they should be rated for local purposes like any ordinary property in a parish. Based supporting the poor, the railways in Scotland are rated like Heritors (q. v.) for building new parish-churches.

According to a return made by railway companies to the Board of Trade in 1862, the cost of running trains was on an average 2s 7¼d. per mile, or about £13 for 100 miles. At this rate, 1000 passengers of mixed classes can be conveyed 100 miles in 25 carriages, as follows: Every first-class passenger for the 100 miles, 6*d*., second class 4*d*., and third class 2½*d*. From this it appears that lowness of fares can be secured only by a large and well-sustained traffic; and that the main reason why fares are much higher than they seemingly might be, is the frequent inefficiency of the number of passengers compared with the accommodation provided for them. A striking exemplification of the possibility of conveying large numbers at very low fares is afforded in the case of 'excursion trains,' in which sometimes 1000 individuals are taken 50 or more miles, and brought back the same day for one or two shillings each.

STATISTICS.—Every year a return is rendered by the Board of Trade to the House of Commons embracing a large variety of particulars concerning railways. The return dated February 8 1864, gives the following statistics for the United Kingdom for the year ending December 31, 1863: Number of miles open, double lines, 7270; single lines, 5052—total, 12,322. Number of passengers (exclusive of holders of season and periodical tickets), first class, 26,086,008; second class, 57,476,669; third class, 121,072,398—total, 204,635,075. Minerals carried, 68,043,154 tons. General merchandise, 22,517,347 tons. Miles travelled by passenger-trains, 61,[illegible]2,146; by goods-trains, 55,760,018—total, 116,502,164. Receipts from passengers—first class, £3,368,670; second class, £4,201,105; third class, £4,[illegible]13,673; holders of season and periodical tickets, £[illegible]4,276—total from passengers, £12,887,110. Receipts for parcels, horses, dogs, &c., by passenger-trains, £1,186,250; receipts for carrying mails, £548,154. Total receipts from passenger-trains, £14,521,528. Receipts for live stock, £636,773; for minerals, £3,419,667; for general merchandise, £10,578,429—total of goods traffic, £16,634,869. Total receipts from all sources, £31,076,165. Total working expenditure, £15,027,234; net balance of receipts over expenditure, £16,048,931. Authorised capital, by shares, £[illegible]795; by loans, £119,298,750—total, £474,[illegible]45. Total paid up on shares and debenture loans, £404,215,802. No summary is given of the average rate per cent. of dividend per annum, which from the tables seems for the most part to be 4½ per cent. in some

instances it is as low as 1, in others it is as high as 6, and rarely higher. The general average is, by computation, 4·16 per cent.—an insufficient return on outlay, due in a great degree to the waste of capital on parliamentary contests, and the construction of rival lines.

On the 1st of January, 1868, the number of miles opened in Great Britain and Ireland was 14,247, constructed at an expense of £502,262,887. The number of passengers carried in 1867 was 287,807,904, and the net receipts £19,631,047. The returns for the year ending Dec. 31, 1869, give the following statistics: number of miles constructed, 15,145½; number of passengers (exclusive of holders of season and periodical tickets), 1st class, 26,818,367; 2d class, 65,655,668; 3d class, 176,300,245; total, 305,668,071. The traffic thereon amounted to 27,571,209 tons, of which 16,720,135 tons were minerals, and 10,851,074 tons were general merchandise. The number of miles travelled during the year was 157,532,255, of which 81,073,231 were passenger-trains, and 76,291,296 goods- and mineral-trains. The gross receipts for passenger traffic, 1st class, were £3,867,976; 2d class, £4,877,765; 3d class, £6,837,203; holders of season and periodical tickets, £630,980; from luggage, parcels, horses, &c., mails, &c., £2,131,448; total from passengers, &c., £18,811,504; receipts from merchandise, £12,969,002; live stock, £886,416; minerals, £8,388,421; total receipts from goods traffic, £22,263,817; a total of receipts from all sources of £42,695,927. The working expenditure amounted to £20,780,078, leaving a remainder of net receipts of £21,915,849. Authorised capital by shares, £449,087,573; by loans, £160,180,080; total, £609,267,653. Total paid up on shares and debenture loans, £518,779,761.

Anticipatory of the chaotic condition into which the railway system might possibly subside, an act of parliament was passed in 1844, for the purpose of enabling government to purchase all lines in the United Kingdom, after they had respectively been 21 years in existence, dating from the passing of the act. This statute came into operation in 1865, and five-sixths of the existing railways will eventually be subject to its provisions. The terms on which the purchase can be effected are these—a sum is to be paid equal to twenty-five years of the divisible profits, taken at an average of the preceding three years, or at a valuation if the company should prefer it. The enormous sum required to buy up existing lines—perhaps £500,000,000—and the generally imperfect character of government management, to say nothing of objections on political grounds, will probably prevent any formidable action under the statute just specified.

Accidents.—During the year ending December 31, 1863, the number of railway accidents (collisions, running off lines, breaking of axles, &c.) in connection with passenger-trains in the United Kingdom was 52—passengers killed, 13; passengers injured, 400; number of servants of companies killed, 7; injured, 35—total killed, 20; injured, 435. Number of accidents to goods and mineral-trains, 60; servants of companies killed, 13; injured, 43; other persons injured, 2. Grand total killed, 24; injured, 445. That out of about 205,000,000 passengers, only 13 were killed by accidents, is a fact most significant of the general good management of railways in the United Kingdom.

Foreign Railways.—The first foreign country that availed itself of railway locomotion was the small kingdom of Belgium, where a number of lines in connection with each other were constructed between 1834 and 1836, and in about ten years afterwards the group was nearly completed in a well-devised and comprehensive scheme. At the beginning of 1864, the number of miles in operation in Belgium was 1073, about eight-tenths of which were the work of government; and we are told, on good authority, that the cost has been on an average £18,000 per mile, but this seems to include expenses on rolling stock. From Belgium railways spread to France, where they were laid down on a plan prescribed by the government, which offered special encouragement to capitalists. The method adopted was to give the land and make the bridges, but besides these heavy items of expenditure, the government was in a number of instances at the cost of the entire permanent way. So far favoured, the promoters, who formed a company, had only to find capital to work and maintain the line. The government, however, relinquished the property only on the footing of a lease for such a number of years as a company was disposed to be satisfied with. Tenders were ordinarily taken from competing bodies of promoters; in this manner the 'concession,' or right of tenancy, has been adjusted at from 50 to 99 years; at the end of the prescribed periods the lines will fall into the hands of the government. Latterly, the French system has outgrown this kind of tutelage; and there is a disposition in companies to act on an independent footing; the state, however, has secured a very general right of property in the existing lines, whether by the method of assistance originally fallen upon, or by giving large subventions of money, on the plan of receiving a share of profits after a certain dividend has been reached. By means of these subventions, as well as a species of guaranteed monopoly of traffic, the profits to shareholders in some French lines, reach from 10 to 12 per cent. Within 99 years from 1852, a large proportion of the French railways will lapse into possession of the state. On one or other of the various plans of government helping companies, and preventing ruinous competition, nearly the whole railway system of continental Europe, Asia, and Africa is established; and in a large number of the foreign railway undertakings everywhere much British capital is invested. The principal continental railways, particularly in France and Belgium, are double lines, and under good management; but the rate of transit is generally slower than in England, and the formalities as to taking tickets and being allowed to enter the trains are exceedingly troublesome.

In Canada, Nova Scotia, and Australia, railways have been successfully established; but in no British dependency has the railway system been latterly pushed forward with such activity or promise of advantage as in India, where, at the end of 1869, lines had been sanctioned which have cost £82,000,000, and about 4000 miles were open for traffic. The undertakings have been materially assisted by government, by giving the land to the companies, by subventions in proportion to the actual outlay, and in some instances by guarantees of a minimum dividend of 5 per cent. to shareholders. In the execution of railways in India, the mercantile community of Great Britain have taken a deep interest, for hitherto the difficulty and cost of transit of cotton and other bulky articles of export from that vast dependency have proved a serious detriment to commercial intercourse. W. C.

Railways, or railroads as they are termed, in the United States date from 1826—7, when a horse tram-road was constructed at the Quincy granite quarries, Massachusetts. In Jan. 1827, nine miles of railroad were completed from the coal-mines of Mauch Chunk, Penna., to the Lehigh River, with branches and turnouts, extending in all 13 miles. Other roads were also constructed by coal companies in 1828—9, and in 1829 a line, 6 miles in length, was commenced, intended to connect Charleston and Hamburg, S. C. On July 4, 1828, the Baltimore and Ohio R.R. was

commenced, and intended for horse-cars only. In 1830 the Hudson and Mohawk R.R. was commenced, on a charter granted in 1826. In 1831 short railroads had been opened in Virginia and Louisiana, and in 1832 67 were in operation in Pennsylvania, and the most important lines in Massachusetts, and the Camden and Amboy in New Jersey, were commenced. In a short time the United States exceeded Great Britain in the number and extent of her railroads, and has ever since exceeded those of other countries. For many years the conduct of American railroads was not equal to that of the first-class lines of the British and Continental railroads, but of late, on many of the leading roads, the comfort of passengers is regarded in the highest degree, and the management, as regards regularity, safety, and in some instances as respects speed, is not surpassed by that of any European road. The system of checking baggage is an American introduction, and is yet unknown in Europe. The introduction of sleeping-cars greatly relieves the fatigue of rapid travel over long routes, and the use of palace- or saloon-cars, with dining-rooms and kitchen, has brought to the American citizen the luxuries that royalty has heretofore alone enjoyed.

In 1869 a line of railway was in operation in North Wales, Great Britain, which is now (1871) attracting much attention. The Port Madoc and Festiniog Railway has a gauge of but two feet, and is used as a regular goods and passenger line, and though it runs through a difficult country, the expenses of constructing and working are so small that the traffic yields a revenue of 30 per cent.; the great advantages of diminished cost for construction and repairs arising from the reduced scale of works and lighter weight of rolling stock render it highly probable that similar roads will be introduced into the United States as feeders to the great lines, and thus include every city and village in the land within the iron network of railways.

Among the more important railroads in America may be named the Grand Trunk and branches in New England and in Canada; New York Central and extensions; Camden and Amboy, &c.; Erie; Reading; Pennsylvania and its extensions; Baltimore and Ohio; Ohio and Mississippi; Illinois Central; the Union and Central Pacific, Northern Pacific, and Southern Pacific, the last two not yet completed. The most successful railroad in the United States is the Pennsylvania, begun in 1847 and completed in 1852, originally connecting Philadelphia with Pittsburg ($354\frac{9}{10}$ miles), but now (1871) embracing an uninterrupted line from the Atlantic to the Pacific, with numerous tributaries in the North-western and South-western States, and forming the longest line of railroad in the world, its total track being about 4000 miles. The Union Pacific Railroad (Omaha to Ogden, 1032 miles), begun in 1868, was opened for traffic in 1870, and extends, in connection with the Central Pacific (Ogden to Sacramento, 743 miles) and Western Branch (138 miles), to San Francisco; total length 1914 miles, which is travelled by express in $2\frac{1}{4}$ days.

Railroads extend over almost every portion of the United States, the Eastern Atlantic States having 4506 miles; the Middle States, 10,510 miles; the Southern Atlantic, 6650 miles; the Gulf States, 3524 miles; the Northern Mississippi Valley States, 18,500 miles; the Southern Mississippi Valley States, 4823 miles; the States of the Plains, 2457 miles; the Rocky Mountain States, 1449 miles; Pacific States, 1155 miles; a total open, in 1870, of $54,435\frac{1}{2}$ miles, and 10,000 more projected, but not completed.

City passenger railroads to the extent of nearly 4000 miles have been constructed, Philadelphia alone having nearly 200 miles. On the Philadelphia roads upwards of 65,000,000 passengers were carried in 1870.

In 1827 there were but three miles of railway in the United States; in 1830 but 41; in 1835, 918; in 1840, 2797; in 1845, 4633; in 1850, 7479; in 1855, 17,928; in 1860, 28,771; in 1865, 34,662; in 1870, 45,000; and in 1871, 54,435 were open to traffic, which have cost, with equipment, $2,177,526,100. S., *Iron in Steam Engineering*, Paris Exh., 1867, Washington, 1869.

RAIMONDI, Marc Antonio, a celebrated engraver, was born at Bologna in 1487 or 1488. He studied for several years under the celebrated painter Francia, the head of the old Bolognese School. On quitting Francia's studio, he went to Venice, and having seen there, for the first time, prints from the woodcuts after Albert Dürer, he engraved on copper two sets of prints from that great master's designs, viz., those illustrating the 'Life of the Virgin,' and of the 'Life and Passion of Christ;' to that of the former he attached the cipher or monogram of Albert Dürer, and it is said that the artist complained of the deception to the senate, but only obtained an order that in future the monogram of Albert Dürer should not be copied; at all events, the latter set is without the monogram or mark. From Venice, R. proceeded to Rome, soon attracted the notice of Raphael, and engraved those works after that master that are so highly valued. R. greatly improved his style by imitating the remarkable delicacy and clearness exhibited in the engravings of Albert Dürer and Lucas Van Leyden; and though, perhaps, in these qualities he did not surpass, or perhaps equal, these masters, he went far beyond them in power and purity of drawing, which he carried further than any other engraver; indeed, it has been stated that Raphael himself assisted the engraver in drawing on several of the plates.

After Raphael's death, having engraved some plates after drawings of a licentious kind by Giulio Romano, he was thrown into prison by Clement VII., but was afterwards liberated, taken under the protection of the pope, and fully employed. This prosperous state of matters, however, soon terminated, for on the sack of Rome by the Spaniards under the Constable Bourbon, in 1527, he was plundered of all he had, and was obliged to flee and take refuge in Bologna, where he seems to have lived till the period of his death, the exact date of which is not known, but it must have been after 1539, for a print by him, after Giulio Romano, of the 'Battle of the Lapithæ,' bears that date.

Good impressions of this eminent engraver's works bear, perhaps, a higher value than any other engravings; but there are numerous impressions from his plates to be met with which are of little value, having been thrown off after they had been greatly worn, and repeatedly retouched. The best impressions are without the name of any publisher. After the plates were taken from the stock of Tommaso Barlacchi, they came into the possession of Antonio Salamanca; afterwards, they passed through the hands of Antonio Lafreri, from thence to Nicholas van Aelst, and lastly, became the property of Rossi or De Rubeis, and by that time they had been completely worn out.—See catalogue of R.'s engravings by Baron Heineken, and Bartsch, vol. 14. Very fine collections are to be seen in the British Museum and the Louvre.

RAIN. At a given temperature, air is capable of containing no more than a certain quantity of aqueous vapour invisibly dissolved through it, and when this amount is present, it is said to be saturated. Air may at any time be brought to a state of saturation by reducing its temperature; and if it be cooled below this point, the whole of the vapour can now no longer be held in suspension, but a part of it, passing from the gaseous to the liquid state, will be deposited in dew, or float about in the form of clouds. If the temperature continues to fall, the vesicles of vapour that compose the cloud will increase in number, and begin to descend by their own weight. The largest of these falling fastest, will unite with the smaller ones they encounter in their descent, and thus drops of rain will be formed whose size will depend on the thickness and density of the cloud. The point to which the temperature of the air must be reduced in order to cause a portion of its vapour to form cloud or dew, is called the dew-point.

Hence, the law of aqueous precipitation may be stated: Whatever lowers the temperature of the air at any place below the dew-point, is a cause of rain. Various causes may conspire to effect this object, but it is chiefly brought about by the ascent of the air into the higher regions of the atmosphere, by which, being subjected to less pressure, it expands, and in doing so, its temperature falls. Ascending currents are caused by the heating of the earth's surface, for then the superincumbent air is also heated and consequently ascends by its levity. Air-currents are forced up into the higher parts of the atmosphere by colder, drier, and therefore heavier wind-currents getting beneath them, and thus wedgeways thrusting them upwards; and the same result is accomplished by ranges of mountains opposing their masses to the onward horizontal course of the winds, so that the air, being forced up their slopes, is cooled, and its vapour liberated in showers of rain or snow. Again, the temperature of the air is lowered, and the amount of the rainfall increased, by those winds which convey the air to higher latitudes. This occurs chiefly in temperate regions, or in those tracts traversed by the *return trade-winds*, which in the north temperate blow from the south-west, and in the south temperate zone, from the north-west. The meeting and mixing of winds of different temperatures is also known to produce rain, but not nearly to the extent at one time believed. It is also increased or diminished according as the prevailing winds arrive immediately from the sea, and are therefore moist, or have previously passed over large tracts of land, and particularly mountain ranges, and are therefore dry. Since the rainfall is evidently much modified by the temperature of the earth's surface over which the rain-producing winds blow, it follows that sandy deserts, by allowing solar and nocturnal radiation to take immediate effect in raising or depressing the temperature, and forests, by delaying, if not, in many cases, counteracting these effects of radiation, have each a peculiar influence on the rainfall.

Rain is the most capricious of all the meteorological phenomena, both as regards its frequency and the amount which falls in a given time. It rarely or never falls in certain places, which are, on this account, designated the rainless regions of the globe—the coast of Peru, in South America; the great valley of the Lower Colorado, in Western Arizona, in North America; Sahara, in Africa; and the Desert of Cobi, in Asia, are examples; whilst, on the other hand, in such places as Patagonia, it rains almost every day. Again, the quantities which have been recorded at some places to have fallen at one time are truly enormous. In Great Britain, if an inch fall in a day, it is considered a very heavy rain. In many parts of the Highlands of Scotland, three inches not unfrequently fall in one day. On the 5th of December 1863, there fell at Portree, in Skye, 12½ inches in 13 hours; and on the same day, 5·2 inches fell at Drishaig, near Loch Awe, where also, two days afterwards, 7·12 inches fell in 30 hours. At Seathwaite, in Borrowdale, 6·62 inches fell on November 27, 1845. But it is in continental, and especially tropical countries, where the heaviest single showers have been recorded. The following are a few of the most remarkable: At Joyeuse, in France, 31·17 inches fell in 22 hours; at Geneva, 30 inches in 24 hours; at Gibraltar, 33 inches in 26 hours; on the hills above Bombay, 24 inches in one night; and on the Khasia Hills, 30 inches on each of five successive days.

In all places within the tropics where the trade-winds are blowing regularly and steadily, rain is of rare occurrence, the reason being, that as these winds come from higher latitudes, their temperature is increasing; and hence they are in the condition of taking up moisture rather than of parting with it; and the return trade-winds, which blow above them in an opposite direction, having discharged the greater part of their moisture in the region of the calms, are also dry and cloudless. Where, however, these winds are forced up mountain-ranges in their course, as on the east of Hindustan, they bring rain, which falls chiefly during night, when the earth's surface is coolest. The region of calms is a broad intertropical belt about 5° in breadth, where the northern and southern trades (see TRADE-WINDS) meeting and opposing, mutually destroy each other, and thus produce a calm. This is the region of constant rains. Here the sun almost invariably rises in a clear sky; but about mid-day, clouds begin to gather; and in a short time, the whole face of the sky is covered with dense black clouds, which pour down prodigious quantities of rain. Towards evening, the clouds disappear, the sun sets in a clear sky, and the nights are serene and fine. The reason of this daily succession of phenomena in the belt of calms is, that there the air, being heated to a high degree by the vertical rays of the sun, ascends, drawing with it the whole mass of vapour which the trade-winds have brought with them, and which has been largely added to by the rapid evaporation from the belt of calms; this vapour is condensed as soon as it is raised to the line of junction of the lower and upper trade-winds, and the discharge is in some cases so copious, that fresh water has been collected from the surface of the sea. As evening sets in, the surface of the earth and the superincumbent air are cooled, the ascending currents cease, the cooled air descends, and the dew-point is consequently lowered, clouds are dissipated, and the sky continues clear till the returning heat of the following day brings round a recurrence of the same phenomena. Since the belt of calms, which determines the rainy season within the tropics, moves northward or southward with the sun's declination, carrying the trade-winds with it on each side, it follows that there will be only one rainy and one dry season in the year at its extreme northern and southern limits; but at all intermediate places, there will be two rainy and two dry seasons, at the equator these will be equally distant from each other.

This state of things is only of strict application to the Pacific Ocean, whose vast expanse of water, presenting a uniformly radiating and absorbing surface, is sufficient to allow the law to take full effect. But over the greater part of the earth's

surface disturbing influences draw the trade winds more or less out of their normal course, and sometimes produce a total reversal, as in the case of the Monsoons (q. v.). These winds determine entirely the rainfall of India, and but for them, the eastern districts of Hindustan would be constantly deluged with rain, and the western parts constantly dry and arid. As it is, each part of South Asia has its dry and wet season, summer being the wet season of the western parts and interior as far as the Himalaya, and winter the wet season of the eastern, and especially south-eastern parts.

The heaviest annual rainfall on the globe is 600 inches on the Khasia Hills, about 500 inches of which falls in seven months during the south-west monsoons. This astonishing amount is due to the abruptness of the mountains which face the Bay of Bengal, from which they are separated by 200 miles of low swamps and marshes. The winds not only arrive among the hills heavily charged with the vapour they have absorbed from the wide expanse of the Indian Ocean, but being near the point of saturation, their temperature not being raised in passing over these swamps, they are, so to speak, ready to burst in torrents over the abrupt cliffs which divert them from their horizontal course into the higher regions of the atmosphere. At 20 miles inland, the annual fall is reduced to 200 inches; 30 miles further south, it is only 100 inches; north, at Gowadatty in Assam, it is only 80 inches. In the north-west of the Bay of Bengal, at Cuttack, it is only 50 inches; while in the north-east, in Arracan, owing to the south-west direction of the winds, it is 200 inches. At Madras, the annual fall is 45 inches; at Seringapatam, only 24 inches; at Bombay, 75 inches; at Uttra-Mullay, 263 inches, and at Mahabalishwar, 254 inches, both on the Western Ghauts; and at Poonah inland, 23 inches. The south-west monsoon discharges from 60 to 80 inches of rain over the parts of Hindustan not bounded by high mountains to the west, before reaching the Himalayas, after which it discharges the greater part of its moisture, 120 to 140 inches, on the outer Himalayan range, at elevations of 4000 to 8000 feet. Thus, four times more rain falls annually on the Khasia Hills than on the Himalaya, owing to the less abrupt face these latter mountains present to the south, to the sandy burning plain, which raise the winds considerably above the dew-point, and to the larger tract traversed by the winds, over which their moisture continues to be discharged as they pass.

The following are a few of the annual rainfalls in the tropics: Singapore, 97 inches; Canton, 78 inches; St Benoit (Isle of Bourbon), 163 inches; Sierra Leone, 87 inches; Caracas, 155 inches; Pernambuco, 106 inches; Rio Janeiro, 59 inches; Georgetown, 100 inches; Barbadoes, 72 inches; St Domingo, 107 inches; Bahamas, 52 inches; and Vera Cruz, 183 inches. In many places in the interior of continents within the tropics, the rainfall is small—not greater, in fact, than in temperate countries, such as the eastern part of England. At Poona, only 23 inches fall annually.

The periodicity of the rainfall disappears as we recede from the tropics, and the times of the year during which it occurs are different—the greater quantity falling in summer at places within the tropics, but in winter in temperate regions. In respect of the rainfall, Europe may be divided into two distinct regions: Western Europe—extending, though in a modified form, into the interior of the continent—and the countries bordering on the Mediterranean. A vast ocean on the one hand, a great continent on the other, and a predominance of west winds, are the determining circumstances in the distribution of the rainfall over Western Europe. As the south-west winds, which are the return trades, descend and touch the earth's surface south of Europe, and as the whole of this continent is therefore within their influence, it follows that the western parts, especially where mountain ranges stretch north and south, are rainy districts, for these mountains, diverting the south-west winds from their horizontal course, force them up into the higher regions of the atmosphere, where, chilled, they form into clouds, or deposit in rain the vapour they can no longer hold in suspension. Hence, the rainiest regions of Europe are Norway, Ireland, the west of Great Britain and of France, Spain, and Portugal. At the Styx, in the Lake District, 38·9 inches fell in January 1851; at Drishaig, 33·2 inches, and at Portree, 32·4 in December 1863; and in the same month, from 24 to 30 inches at many other places in the Scottish Highlands. In the west of Great Britain and Ireland, in the vicinity of high hills, the average rainfall is from 80 to 150 inches. At Bergen, in Norway, it is 89 inches; in the Peninsula, at Coimbra, it is 118 inches; at Oviedo, 74 inches; and at St Jago, 73 inches; and in France, it is 51 inches at Nantes, and 49 at Bayonne. At places at some distance from hills, and in more inland districts, the annual fall is much diminished. Thus, in the west of Great Britain, away from hills, it is from 30 to 45 inches; while in the east, it is from 20 to 28 inches. In France, it averages 30 inches; and in the plains of Germany and Russia, 20 inches, while in some parts of Sweden and Russia, it falls as low as 15 inches. In the interior of Europe, in mountainous districts, it rises much above these amounts; thus, at the Brocken, it is 59 inches. An important distinction between the mode of distribution of the rainfall in the west of Europe and that of more inland places is, that the greater part of the annual amount in the west falls in winter; whilst in the interior, this happens in summer. This difference is particularly striking on the different sides of Great Britain, and arises from this circumstance, that as the clouds are much lower in winter, they are arrested and drained of their moisture by the less elevated hills, leaving little to be deposited eastwards; but in summer, being high, they pass above, and discharge themselves in the interior. Thus, for every 10 inches of rain which fall at the following places in winter, there fall in summer respectively 8½ inches in the west of Great Britain, 11 inches in the east of Great Britain and west of France, 15 inches in the east of France, 20 inches in Germany, and 27 inches in the north and east of Russia.

The peculiarity of the rainfall of the basin of the Mediterranean depends on its proximity to the burning sands of Africa, a predominance of northerly winds, and the position of the Pyrenees and Spanish sierras to the west, on which the south-west winds discharge their rains before arriving on the north shores of the Mediterranean. In the valley of the Rhone, four times more rain falls in autumn than in summer; and south of the Alps, six times more rain falls with the north-east than with the south-west winds, being the reverse of what takes place in England. In Italy, the quantity diminishes as we approach the south. Along the Syrian and North African coasts, it rarely rains in summer, but frequently in winter. In the valley of the Rhone, the annual fall ranges from 20 inches at its mouth to 63 inches at St Rambert, the average being 30 inches. This is also the average of the valley of the Po; but on ascending to the Alps, it rises, as at Tolmezzo, to 96 inches.

The rainfall in the west of the American continent is distributed similarly to that of Europe—the amount being dependent on the physical

configuration of the surface over which the westerly winds blow. The yearly amount increases as we proceed northward; thus, at San Francisco it is 22 inches; at Fort Reading, 29 inches; at Fort Oxford, 72 inches; at Fort Vancouver, 47 inches; at Astoria, 86 inches; at Steilacoom (Wash. Ter.), 54 inches; and at Sitka, in Alaska, 90 inches.

But in the United States, the manner of the distribution of the rain is very different from that of Europe. The United States are dependent for their rain not on the Pacific Ocean, but on the Gulf of Mexico. There can be little doubt that, but for the high range of the Rocky Mountains in Central America, the greater part of the States would be an arid waste. These mountains are so high as to present an effectual barrier to the passage of the trade-winds, which blow over the Gulf of Mexico; they are, on this account, turned northward, and spread themselves over the States, especially over the low basin of the Mississippi. These winds being characterised by great heat, and loaded with much moisture from the warm waters of the Gulf of Mexico, tend to disturb the statical equilibrium of the atmosphere. When they have blown for some time, vast accumulations of heat and moisture take place, the equilibrium is destroyed, a great storm arises in consequence, sweeping eastward over the States, and in many cases crossing the Atlantic, and descending with violence on Western Europe. In the States, the southerly winds preceding the storm give place to the dry north-west winds, which rapidly clear the sky, and bring brilliant bracing weather in their train. It appears, in short, that the south winds from the Gulf of Mexico spread the moisture over the States, and the north-west wind disengages this moisture from them by getting below them, by their greater density, and thrusting them into the higher regions of the atmosphere. If this be the case, as the phenomena seem to warrant, then the heaviest rainfalls will be in the valleys, and the least on the higher grounds—a mode of distribution quite different from what prevails in Europe. And such is really the case, for the greatest amount of rain falls in Florida, the low flats of the Mississippi, then along its valley, and lastly in Iowa, or in that remarkable depression at the head of the river; and the least quantities on the Alleghanies, especially on their higher parts, and on the high grounds of the Missouri district. The following figures, giving the average annual amount in inches, shew this in a clear light: Pensacola, 57; Fort Brooke, 55; and Fort Pierce, 63—in Florida: Monroeville, 66; and Mobile, 64—in Alabama: Natchez, 58; Jackson, 53—in Mississippi: Rapides, 63; New Orleans, 52—in Louisiana: Savannah, 48—in Georgia: Nashville, 53—in Tennessee: Fort Madison, 50—in Iowa. At Athens, in Georgia, south of the Alleghanies, the amount is 36 inches; at Alexandria, in Virginia, also 36 inches; and at Jefferson, in Missouri, 38 inches. In the Northern States, the quantity diminishes at most places to between 27 and 45 inches, and the mode of its distribution becomes assimilated to that of Europe.

When raindrops fall through a stratum of air below 32°, they become frozen, and form *Hail* (q. v.). When the vesicles are formed in air under 32°, *Snow* (q. v.) is the result.

RAI'NBOW. The ordinary phenomena of the rainbow are usually visible on every occurrence of a 'sunny shower,' and we need not describe them particularly until we deduce them, one after another, from their cause. The most careless observation shews us that, for the production of a rainbow, we must have a luminous body of moderate angular diameter, and *drops* of water; for it is never seen except by direct sun or moon light, and never in a cloud unless rain be falling from it. Now, a falling drop of water takes, by its molecular forces, a *spherical* form. Also, as there is separation of the various colours of which white light is composed, the cause of the phenomenon must involve *Refraction* of Light (q. v.), because by Reflection (q. v.) these colours are not separated. But, again, the spectator who views the rainbow has his back to the sun, and rays of light merely refracted by a raindrop could not be thus sent back to the spectator. The phenomenon must therefore depend upon successive reflections and refractions, and we shall investigate in an elementary manner what appearances we ought to *expect* as the result of such processes according to the known laws of optics; merely premising that the fundamental points of the explanation were first given by Newton in the second book of his *Optics*.

First, then, let us consider what becomes of parallel rays of light, *of one colour* or refractive index (see REFRACTION), which are successively refracted and reflected in a single spherical raindrop.

For our immediate purpose, it is sufficient to suppose that the refractive index (see REFRACTION) of water is $\frac{4}{3}$; that is, the incident and refracted rays make with the perpendicular to the refracting surface of water, angles whose sines are in the ratio of 4 to 3.

Let the circle represent a section of the drop made by *any* plane passing through its centre O, and the line SO, which joins its centre with the

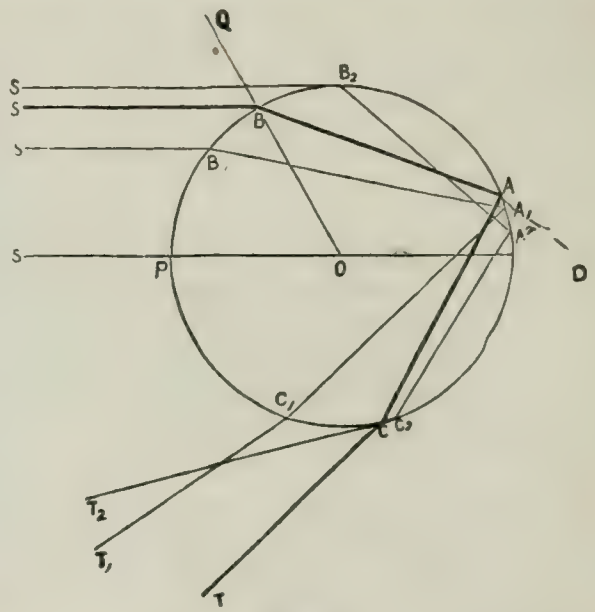

Fig 1.

sun; the sun being supposed, for the moment, to be a single luminous point, situated at so great a distance that lines drawn to it from different points of the drop are parallel. A ray of light, SB, falling on the drop in the plane of section will be, of course, partly reflected and partly refracted at B. The reflected part does not concern us, as in it all colours would travel together; and, in fact, the result of reflection from the external surfaces of the drops is simply to illuminate the background feebly. Join OB, and produce it to Q. Then the refracted ray (see REFRACTION) will have in the drop the direction BA, where the ratio of the sines of SBQ and OBA is the refractive index of water—i. e., 4 : 3 nearly. Arriving at A, the ray will be partly refracted in some such direction as AD, and the rest reflected in the direction AC. Now AD

obviously cannot fall on the eye of a spectator whose *back* is turned to the sun, and it has, therefore, nothing to do with the rainbow. The internally reflected ray, AC, on reaching the surface at C, is partly refracted in the direction CT (where BS and CT are symmetrically situated on opposite sides of OA), and partly reflected internally. The latter portion we must consider when we come to the cause of the *secondary*, or outer rainbow, the former is that which at present concerns us. Let SB_1, SB_2, be other incident rays. After a refraction, a reflection, and a second refraction, they emerge in the directions C_1T_1, C_2T_2, respectively. From the figure, which is drawn from calculation, it is obvious that both C_1T_1 and C_2T_2 are *less* inclined to OS than CT is. Hence for rays, parallel to SO, falling on the drop, and emerging after suffering two refractions and a reflection, the *final* direction is more and more inclined to SO, as the point of incidence, B_1, is further from P, at least up to some such point as B; after which (for points situated as B_2) it diminishes again. By proper mathematical methods, it is easy to find that the angle SOB is about 59° 24′, if the refractive index be $\frac{4}{3}$. Now, by a general property of maxima or minima in optics (see CAUSTIC), the rays falling on the drop near to B will emerge nearly parallel to CT; while those incident near any other point (as B_1) will be widely scattered at emergence. And we may evidently extend this reasoning to all other rays by supposing the above figure to rotate about the axis SO.

The conclusion is, therefore, that if homogeneous light fall in parallel lines on the spherical drop, those rays which have been *twice* refracted at the surface, and *once* internally reflected, will, on emergence, all lie within the cone formed by the revolution of CT about SO, and will be *condensed* towards the surface of that cone. Hence such an illuminated drop gives off by this particular process a solid cone of rays, much condensed towards its external boundaries.

So much for each drop. Next, let us inquire what the appearance will be to an eye in any given position. Referring to the next figure, in which

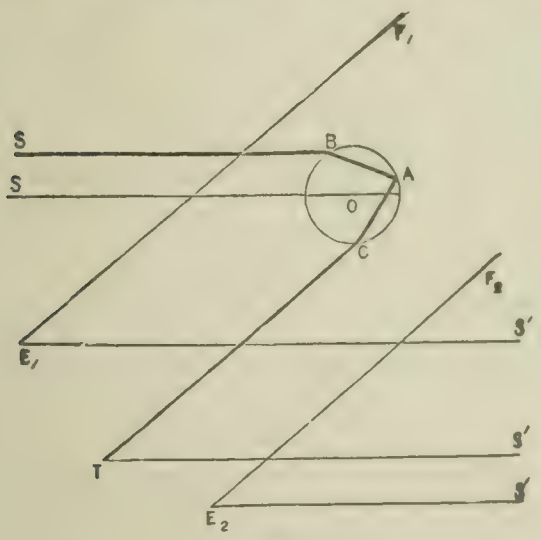

Fig 2.

the letters are the same as in the former, draw TS′ parallel to SO. Then TS′ is the direction of the line drawn to the point on the heavens diametrically opposite to the sun. So are E_1S_1' and E_2S_2', drawn from any assumed positions, E_1 and E_2, of the spectator's eye.

If the eye be placed in the surface of the cone just described, as at T, it will receive the condensed ray which emerges in the direction CT; if at E_1 (within the cone) it will receive diffused rays from the drop; if at E_2 (outside the cone), it will receive no light at all.

To put this in a popular form: Draw E_1F_1 and E_2F_2 parallel to TC; then we may evidently say that the eye receives a coloured light from any drop whose angular distance from the point opposite the sun is CTF, a diffused light if the angular distance be less than this, and none at all if it be greater. By methods already alluded to, it is found that CTS is nearly 42° 12′ for the least deviation[1].

Hence, if the sun were a luminous point, emitting homogeneous light whose index of refraction in water is $\frac{4}{3}$, a spectator looking through a shower of falling raindrops towards the point immediately opposite to the sun, would see a bright circle of angular diameter 84° 24′ surrounding that point, diffused light within that circle, and darkness without it.

The effect of the finite angular diameter of the sun is evidently to widen this circle into a circular luminous band, whose breadth is the sun's apparent diameter, and whose mean radius is 42° 12′.

Next, let us consider the different refrangibilities of the coloured constituents of white light. The investigation above hinted at shows that the radius of the luminous circular band is greater, the less the refractive index; the proof, though easy enough, would be out of place in this work. Hence the appearance actually observed with sunlight will be formed by the superposition of corresponding overlapping, circular bands, the result being best put into as we consider the primary colours in the order from red to violet (see SPECTRUM). That is, we shall have a circular illuminated space, brightest towards the edge, with a homogeneous red ring at its external boundary, and a gradual mixture of the prismatic colours as we look nearer to the centre. This agrees very well with observation, and so do the calculated diameters of the external red (42° 22′) and internal violet (40° 35′) rings.

But what becomes of the light once reflected inside the drop, and then refracted out? Let fig. 3 represent again a section of the drop, with sunlight falling on it in lines parallel to SO, and let us trace the course of one ray, as SB. The part reflected at B is to be disposed of as before, it goes

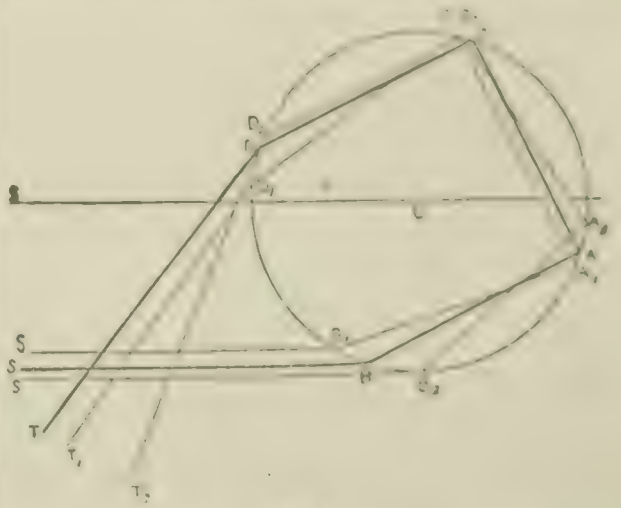

Fig 3.

merely to illuminate, feebly, the otherwise dark background of cloud and vapour. The refracted portion proceeds, as before, to A, where part is reflected internally along AC, and part refracted out. The latter portion, as we have already seen, cannot possibly reach the eye of a spectator whose

back is turned to the sun. Similarly, at C, there is internal reflection along CD, and refraction out of the drop. The refracted part has already been considered, as the cause of the *primary* rainbow. The reflected part will again at D be separated into two; one, reflected internally, which proceeds to form the tertiary and higher orders of bow; and the other, escaping from the drop in the line DT, which goes to form the *secondary* bow. This we will consider with some care, because the secondary bow, though necessarily fainter than the primary, is usually seen; the tertiary and higher bows, each much fainter than the preceding one, since the beam inside the drop is weakened at each succeeding reflection, require no notice, as even the tertiary has never been observed in nature.

As before, we have traced the courses of two other beams, SB_1 and SB_2, in their passage to form part of the secondary bow. They are respectively $SB_1A_1C_1D_1T_1$ and $SB_2A_2C_2D_2T_2$; and the figure shews us that the final rays D_1T_1 and D_2T_2 are each *more* inclined to SO than DT is. There is, therefore, a particular ray, SB, whose final direction, DT, is *less* inclined to SO than that of any other ray which has suffered two refractions and two internal reflections; and, as before, the emergent light is condensed towards this minimum. If, then, the figure be made to revolve about SO, we see that DT will describe a cone, that *inside* this cone there is no refracted light, that towards the surface of the cone, part of the light is condensed, and that the rest of it is diffused through *exterior* space.

So much for one drop; let us now, as before, consider what will be seen by an eye in any position with regard to this particular drop. In fig. 4, the

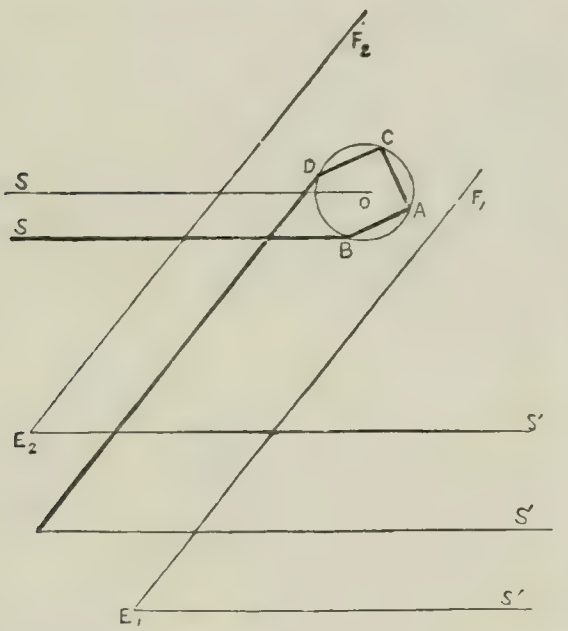

Fig. 4.

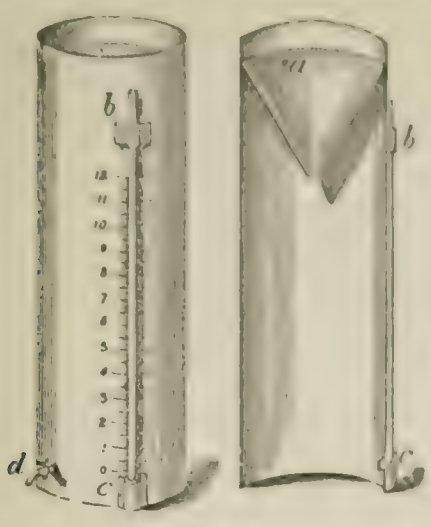
letters denote the same things as in fig. 3. Hence if the eye be placed at T, it will receive the maximum of light in a direction making an angle DTS′ with the point in the heavens opposite to the sun. If at E_1, it will receive some of the diffused light from a drop whose angular distance from the point opposite the sun is *greater* than DTS′; and if at E, it will receive no light at all, the drop's angular distance from the point opposite the sun being *less* than DTS′. Hence the appearance presented by a shower of drops is, for homogeneous light coming in parallel lines, a bright circle, whose angular radius is DTS′; diffused light outside that circle, and no light within it. When the light comes from a source of finite angular diameter, as the sun, the only effect is, as in the primary bow, to *widen* the bright circular band. When we consider the various components of white light, calculation shews us that DTS′ is least for red, and greatest for violet. Hence we have a series of concentric coloured bands superposed, their diameters increasing from the red to the violet. Hence the secondary rainbow has its inner edge red, and its outer violet; the intermediate space being an exceedingly mixed, or impure Spectrum (q. v.). The results of geometrical optics shew us that the angular diameter of the red is 100° 48′, and of the violet 106° 44′; so that the breadth of the bow is 3° 30′ nearly.



In nature, these rough results are pretty closely verified; but a more profound investigation into the circumstances of the problem shews us some modifications. In the first place, we find that for each kind of homogeneous light the actual maximum of brightness is in a circle of rather less angular diameter than that given by the more elementary investigation for the primary bow; and rather greater for the secondary. Secondly, and still with homogeneous light, there is a succession of feebler and feebler concentric circles of maximum brightness—inside the principal maximum in the primary bow, and outside it in the secondary. These give rise to what is always seen in a fine rainbow, the so-called *spurious* or *supernumerary* bows, lying close inside the violet of the primary bow, and outside that of the secondary. These are fainter and more impure as they proceed from the principal bow, and finally merge into the diffused white light inside the primary bow, and outside the secondary.

The angular dimensions of these bows, principal and spurious, were calculated from theory by Airy, and carefully measured by Miller in the artificial bow formed by passing light through a very fine column of water descending through a small aperture, and the accordance was perfect.

The lunar rainbow, which is a comparatively rare, but very beautiful phenomenon, differs from the solar simply in the source and intensity of the light by which it is produced; and, as in all cases of feeble light, the distinction of the colours is very difficult. In fact, except under the most favourable circumstances, the lunar rainbow rarely shews colours at all, giving a pale ghostly gleam of apparently white or yellow light.

RAIN-GAUGE. The use of rain-gauges is to ascertain the amount of rain which falls at any given place. They are of various constructions. The simplest is that which consists of a metallic cylinder, from the bottom of which, a glass tube (*bc*), divided into inches and parts of an inch, projects downwards. It is provided with a funnel, inserted within at the top, to prevent evaporation, and the rain-water is emptied out by means of a stop-cock (*d*) at the bottom, or, still simpler, by a hole (*a*) pierced in the funnel at the top. (See accompanying wood-cut.) As this form of gauge is objectionable on account of the frequent breakage of the glass-tube by frost, a float is used instead, which is raised by the water, and a scale is attached to it, to shew the quantity of rain received. As this gauge does not admit of very nice readings, another sort is frequently employed, viz., a receiving-vessel and a glass measure of much smaller diameter, which thus admits of as nice graduation as may be desired. As, practically, there is often great difficulty or trouble experienced in replacing the glass measure when it chances to get broken, the late G. V. Jagga Râo, a wealthy zemindar of Vizagapatam, proposed a gauge in the form of a funnel having a diameter of 4·697 inches, or an area of 17·33 square inches. Now, as a fluid

ounce contains 1·733 cubic inches, it follows that for every fluid ounce collected by this gauge, the depth of an inch of rain has fallen. The best form is that of

Rain-gauge.

the Smithsonian rain-gauge, and which consists of a tube of brass 10 inches deep, and three-fourths of an inch in internal diameter, having attached a funnel 3 or 4 inches deep, and 2 inches in diameter. The depth of rain is measured by means of a scale of thin whalebone, divided to indicate the 10th and 100th of an inch.

A most important point with regard to the rain-gauge is its height above the ground. Mr Phillips found the fall of rain at York for 12 months in 1833–1834, to be 14·96 inches at a height of 213 feet from the ground; 19·85 inches at 44 feet; and 25·71 inches on the ground. This remarkable fact—viz., that different quantities are collected at different heights, the amount being always greater at the lower level, has been confirmed wherever the experiment has been made. No perfectly satisfactory account has yet been given of this singular phenomenon. The condensing of the vapour of the atmosphere on the surface of raindrops as they fall—the rebound of the finer particles into which many of the drops break themselves as they strike with violence on the ground—and the eddies and currents which prevail most and strongest around isolated objects raised above the surface of the ground, to a large extent account for the phenomenon. Of these three, the greatest weight is to be given to the last two; and this is confirmed by the fact, that a gauge placed on the roof of a building that happens to be flat, of considerable area, and with few or no chimney-stalks to disturb the air-currents, collects an amount equal to that collected at the same place by a gauge on the ground. The proper size and shape of the rain-gauge, and its height above the ground, so as to measure with the greatest exactness possible the real quantity of rain that falls, about all of which much diversity of opinion exists, have recently undergone investigation in a series of extensive experiments conducted by Major Ward and Mr Symons, in Wilts; and by the Rev. J. Chadwick Bates, near Manchester.

RAIN-PRINTS, small pits observed on the surfaces of some argillaceous rocks, and believed to be the impressions of rain-drops. See ICHNOLOGY.

RAI'NY LAKE forms a portion of the boundary-line between British North America and the United States. It is situated 160 miles west of Lake Superior, is 1160 feet above sea-level, and is about 35 miles long, and 5 miles in average breadth. Its surplus waters are carried off to the Lake of the Woods, in a west south-west direction, by the Rainy River, which is about 100 miles in length, and the banks of which are covered with pine forests.

RAISED SEA BEACHES. See BEACHES, RAISED.

RAISINÉ, a rich or sweetened, much esteemed in France, made by boiling new wine, and skimming until only half the quantity of wine remains; after which it is strained, spiced, and one-fourth part of sugar added to it, and it is allowed to simmer gently, till the apples are thoroughly mixed with the wine, when it has a very pleasant appearance and taste. Cider may be used instead of wine.

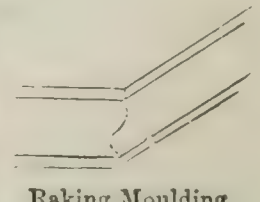
RAISINS are dried grapes prepared by two different methods. The first method consists in partially cutting through the stalk of the ripened bunches, and allowing them to shrink and dry upon the vine by the heat of the sun. These are by far the better sort, and are called *Raisins of the Sun*, or Muscatels. Malaga is much celebrated for its sun raisins, which are the finest in the world. The raisins prepared by the other method are called *Lexias*, and are gathered and hung on lines or laid on prepared floors to dry in the sun. When dried, they are dipped in a hot *lye*, made by dissolving the alkali out of wood-ashes or barilla with water, until the filtered fluid has a specific gravity of about 1·100; to this is added, for every ten gallons, a pint of olive oil and a quarter of a pound of salt. After dipping, the fruit is laid on hurdles of wicker-work to drain, and is continually exposed to the sun for about a fortnight. The raisins are then pulled from the stalks, and packed into boxes for transport to other countries. The qualities best known in the markets are Valencias and Denias from Spain, Malagas from Malaga, and Black Savarins and Sultanas from Asiatic Turkey. The Currant (q.v.), or Corinth, as it was originally called, is only a small variety of grape peculiar to the Greek Islands, cured in the same way, and in itself forming a large staple of those islands. The United States imported, in 1870, more than 11,000 tons of raisins proper, and 3800 tons of currants in addition.

RÂJAH, or more correctly RÂJÂ (from the Sanscrit *rājan*, king, cognate with the Latin *rex* of *rex*), is originally a title which belonged to those princes of Hindu race who, either as independent sovereigns or as feudatories, governed a territory; it then, however, became a title given by the native governments, and, in later times, by the British government to Hindus of rank, and it is now not uncommonly assumed by the zemindars or landholders; the title Mahárájah, or 'great Rájah,' being, in these days, generally reserved to the more or less independent native princes. According to the ancient social system of India, the rájah belonged to the kshattriya or military caste (see CASTE); now, however, the title is given to, and assumed by, members also of an inferior caste.

RAJAMAHENDRI, or RAJAMUNDRY, a town of Hindustan, capital of a collectorate of the same name in the presidency of Madras, stands on the left bank of the Godavari, about 60 miles from the mouth of that river, and in long. 81° 53' E. To the north of the town is the Fort, a square edifice, comprising the barracks, hospital, jail, and magazine. The nobler kind of game, as well as wild-fowl of all sort, abounds in the vicinity, and the situation and scenery are in the highest degree beautiful. The Godavari is here about two miles wide, and is crossed by a steam ferry. Napkins, table-cloths, and drills are manufactured. Pop. 15,000, about a fourth of whom are Brahmans. Of the collectorate of R., the area is

6050 square miles, and the population upwards of 1,000,000.

RÂJATARANGIN'Î (or 'the river of kings,' from the Sanscrit *râjan*, king, and *tarangin'î*, a river or stream) is the name of four chronicles of the history of Cashmir written in Sanscrit verse; the first by *Kalhan'a*, bringing the history of Cashmir till about 1148 after Christ; the second, a continuation of the former, by *Jonarâja*, to 1412; the third, a continuation of the second, by *S'rîvara*, a pupil of Jonarâja, to 1477; and the fourth, by *Prâjyabhat't'a*, from that date to the conquest of the valley by the Emperor Akber. Amongst these chronicles, however, it is especially the first which has earned a great reputation, inasmuch as it is the most important and the completest of all *known* Hindu chronicles, and, for this reason, may be considered as the only surviving work of Sanscrit literature which betrays an attempt at historiography. The author of the work, the Pandit Kalhan'a—of whom we merely know that he was the son of Champaka, and lived about 1150, under the reign of Sinhadeva of Cashmir—reports that before entering on his task, he had studied eleven historical works written previously to his time, and also a history of Cashmir by the sage Nîla, which seems to be the oldest of all; but that, not yet contented with these sources of information alone, he had also examined old documents, such as grants and proclamations made by kings, texts of laws, and sacred books. It may be presumed, therefore, that Kalhan'a had not merely the desire, but set honestly to work to elucidate the history of Cashmir up to his date. And so far as the last few centuries preceding him are concerned, it is possible that the facts narrated by him are reliable; but owing to the uncritical disposition of the Hindu mind in all matters that regard historical facts, those especially of a more or less religious or legendary character, and also to his bias to produce a consistent system of chronology, great doubts must attach to all that relates in his work to the ancient history of India. In spite of these shortcomings, however, which are more those of the nation to which the author belonged, than those of the individual himself, much that is reported by Kalhan'a is the only source of information we have of the history of Cashmir, and much very valuable as coming from an indigenous source. Kalhan'a begins his work, as may be expected, with the mythological history of the country; the first king named by him is Gonarda, who, according to his chronology, would have reigned in the year 2448 before Christ; and the last mentioned by him is Sinhadeva, about 1150 after Christ. The Sanscrit text of the complete work, together with that of the three other Râjatarangin'îs, which is of little extent, has been edited at Calcutta, 1835, under the auspices of the General Committee of Public Instruction and the Asiatic Society of Bengal. Six sections of it have been edited, with notes, and learned appendixes, in French, by A. Troyer, who likewise translated into French these sections, as well as the remaining two (*Râdjatarangînî, Histoire des Rois du Kachmir*, &c., vols. 1—3. Paris, 1840—1852).—See also H. H. Wilson, *An Essay on the Hindu History of Cashmir*, in the *Asiatic Researches*, vol. xv., and Lassen's *Indische Alterthumskunde*, vols. i. and ii.



RAJMAHA'L, a town of India, in the British district of Bhaugulpore, presidency of Bengal, and a station on the line of railway from Calcutta to the north-west frontier, stands on a steep eminence on the right bank of the Ganges, 200 miles by land north-north-west of Calcutta. Its position is advantageous, and it was long the chief town of the Bengal and Bahar provinces. Since the removal of the British courts of justice, however, its prosperity has declined. It now presents a deserted and ruinous appearance, but is still noteworthy for the remains of its once splendid palace, and for its important transit-trade. It contains twelve market-places, and has about 30,000 inhabitants, most of whom are employed in providing for the wants of the vast number of travellers who pass through the town by land and water.

RÂJPOOTS, or RÂJPUTS (from the Sanscrit *râjan*, king, and *putra*, son; hence literally, 'sons of kings'), is the name of various tribes in India which are of Aryan origin, and either descended from the old royal races of the Hindus, or from their Kshattriya or warrior caste (see CASTE). At all periods, they seem to have played a conspicuous part in the history of India; and all over Hindustan there are many families who, rightly or wrongly, claim the title of Râjputs. At present, they occupy chiefly the country known as Râjasthân or Râjputana, including, amongst other states, those of Mewar, Marwar, Jeypur, Bikanir, Jessulmir, Kotah, and Bundi. Before the invasion of Mahmud the Ghiznevide, four great kingdoms were under the dominion of Râjput families—viz., Delhi, Kanoj, Mewar, and Anhulvarra; and all the kings mentioned in the *Râjatarangin'î* (q.v.) of Kalhan'a were of Râjput origin.—For the history, &c., of the R., and the geography of Râjputana, see Colonel James Tod's *Annals and Antiquities of Râjasthân, or the Central and Western Râjpoot States in India* (2 vols., Lond. 1829); Ritter's *Erdkunde*, vol. vi. pp. 724, ff.; Lassen's *Indische Alterthumskunde*, vols. i. and ii. (*passim*); A. Troyer's *Râdjatarangin'î*, vol. iii. (*Eclaircissements historiques*, &c.).

RAKE, an agricultural and horticultural implement, in use from very ancient times. In its simplest form it consists merely of a bar of wood or iron, with wooden or iron teeth inserted into it, and attached at right angles across the end of a long handle. It is used for collecting straws, &c., from a field after it has been reaped or mown, or stones from newly-tilled ground, sometimes also in gardens, for covering seeds. A long rake, with a short triangular framework instead of a handle, and curved teeth, is much used in hayfields in England, and is known as the *ell-rake*. Rakes are also adapted for being drawn by horses; and there are many modifications both of the hand-rake and the horse-rake.

RAKE, in Naval Language, has more than one meaning. The rake of a ship's stern or bow is the length to which the keel would have to be prolonged to bring it under the most projecting point of the stern or bow. Raking masts are masts set aslope, so that the angle they make with the keel towards the stern is less than a right angle, as in a brigantine. To rake a ship is to bring guns to bear so as to fire them along her deck from end to end; this is the most disastrous thing that can happen to a vessel in action, and it is the object of all good seamanship to avoid it. When a ship is raked at short range, grape can be used with great and fatal effect.

RAKING MOULDING a moulding not horizontal or vertical, but sloping at an angle. When joined to a horizontal moulding, the raking moulding is run so as to mitre with the true vertical profile of the former, and is therefore different from it in section.

Raking Moulding.

RAKO'CZYMARSCH, a simple but grand military air by an unknown composer, said to have been the favourite march of Francis Rako'czy II. of Transylvania, and at all events much played in his army. The Magyar Hungarians adopted it as their national march, and in 1848 and 1849, it has been alleged to have had the same inspiriting effect on the revolutionary troops of Hungary as the *Marseillaise* on the French. Like the *Marseillaise* in France, it has been placed under the ban of the Austrian government at various periods of political excitement. In 1848, several attempts were made by Hungarian poets to set it to appropriate verses, but without much success. The air most generally known in Germany and elsewhere out of Hungary as the Rako'czymarsch, which is introduced by Hector Berlioz in his *Damnation de Faust*, is a weak paraphrase of the original by Ruziska.

RAKSHAS, or RÂKSHASA, is, in Hindu Mythology, the name of a class of evil spirits or demons, who are sometimes imagined as attendants on Kuvera, the god of riches, and guardians of his treasures, but more frequently as mischievous, cruel, and hideous monsters, haunting cemeteries, devouring human beings, and ever ready to oppose the gods and to disturb pious people. They have the power of assuming any shape at will, and their strength increases towards the evening twilight. Several of them are described as having many heads and arms (see, for instance, RÂVANA), large teeth, red hair, and, in general, as being of repulsive appearance; others, however, especially the females of this class, could also take beautiful forms in order to allure their victims. In the legends of the *Mahâbhârata*, *Râmâyana*, and the *Purân'as*, they play an important part, embodying, as it were, at the period of these compositions, the evil principle on earth, as opposed to all that is physically or morally good. In the *Purân'as*, they are sometimes mentioned as the offspring of the patriarch Pulastya, at other times as the sons of the patriarch Kas'yapa. Another account of their origin, given in the *Vishn'u-Purân'a*, where, treating of the creation of the world (book i. chap. v.), is the following: 'Next, from Brahmâ, in a form composed of the quality of foulness, was produced hunger, of whom anger was born; and the god put forth in darkness beings emaciate with hunger, of hideous aspects, and with long beards. Those beings hastened to the deity. Such of them as exclaimed: "Not so, oh! let him be saved," were named Râkshasa (from *raksh*, save); others who cried out: "Let us eat," were denominated, from that expression, Yaksha' (from *yaksh*, for *jaksh*, eat). This popular etymology of the name, however, would be at variance with the cruel nature of these beings, and it seems, therefore, to have been improved upon in the *Bhâgavata-Purân'a*, where it is related that Brahmâ transformed himself into night, invested with a body; this the Yakshas (q. v.) and Râkshasas seized upon, exclaiming: 'Do not spare it—devour it!' when Brahmâ cried out: 'Don't devour me (*mâ mâm jaksha'a*)—spare me! (*rakshata*).' (See F. E. Hall's note to Wilson's *Vishn'u-Purân'a*, vol. i. page 82.) The more probable origin of the word *Rakshas*—kindred with the German *Recke* or *Riese*—is that from a radical *r'ish* or *rish*, hurt or destroy, with an affix *sas;* hence, literally, the destructive being.

RALEIGH, SIR WALTER, the son of Walter Raleigh of Fardel in Devonshire, was born in 1552 at Hayes, on the coast of that county. In 1568, he was sent to Oxford as a commoner of Oriel College, and though his residence there was brief, gave token of remarkable ability. Only the year after, relinquishing study for adventure, he went to France as volunteer in an expedition in aid of the Huguenots; and some years subsequently we find him serving in the Low Countries in a force sent by Queen Elizabeth to assist the Dutch in their patriotic struggle against the Spaniards. Of this earlier part of his career, nothing specially remarkable is recorded. In 1579, he made his first venture in the field of activity which through life continued at intervals to attract him, sailing, in conjunction with his half-brother, Sir Humphrey Gilbert, with the purpose of founding a colony in North America. The expedition proved unsuccessful, being roughly handled by a Spanish force, and obliged to return in somewhat evil case. During the year following, R. held a captain's commission in Ireland, where, in operations against the rebels, he distinguished himself by his courage and conduct. Shortly after his return, he seems first to have attracted the notice of Queen Elizabeth, with whom he speedily rose high in favour. The story which attributes the commencement of his relations with her to his graceful gallantry in spreading before her his costly mantle as a carpet, is so well known, that it need only be glanced at in passing. For some years forward, he was constant in his attendance upon the queen, who distinguished him by employing him from time to time in various delicate offices of trust, and by substantial marks of her favour. The spirit of enterprise was, however, restless in the man; and in 1584, a patent having been granted him to take possession of lands to be discovered by him on the continent of North America, he fitted out two ships at his own expense, and shortly achieved the discovery and occupation of the territory known as Virginia, a name chosen as containing an allusion to the 'Virgin-queen' herself. Elizabeth also conferred on R. the honour of knighthood. If we except the questionable benefit—with which R.'s name remains connected—of the introduction of tobacco into Europe, no immediate good came of the colony; and after some years of struggle, during which he sent out several auxiliary expeditions, he was forced to relinquish his connection with it.

During the years 1587—1588, the country being menaced by a Spanish invasion, R. was actively and responsibly occupied in organising a resistance, and held command of the queen's forces in Cornwall. In the latter year, he shared with new access of honour in the series of actions which ended in the defeat and dispersion of the great Armada, and was thanked and rewarded for his services. Shortly after (1593), in consequence of an intrigue, resulting in his private marriage with Elizabeth Throckmorton, one of the queen's maids of honour, he incurred her majesty's severe, but only temporary, displeasure. In his banishment from court, he recurred to those schemes of conquest and adventure in the New World which formed one main dream of his life; and, in 1595, headed an expedition to Guiana, having for its object the discovery of the fabled El Dorado, a city of gold and gems, the existence of which in these regions was then generally believed in. Of this brilliant but fruitless adventure, on returning, he published an account. Having been reinstated in the royal favour, he held in 1596 the post of admiral in the expedition against Cadiz commanded by Howard and the Earl of Essex, and was admittedly the main instrument of its success. Also, in the year following, he took part in the attack on the Azores made by the same commanders. In the court intrigues which ended in the downfall of the Earl of Essex, he after this became deeply involved; and certain points of his conduct, as notably the sale of his good offices with the queen in behalf of such of the earl's

adherents as would buy them, though easily regarded by the current morality of the time, have fixed somewhat of a stain on a fame otherwise so splendid.

With the death of Elizabeth in 1603 ends the brilliant and successful portion of R.'s career. Her successor, James, from the first regarded him with a suspicion and dislike which he was at no pains to conceal. He had besides made powerful enemies—the principal of whom were Cecil and Howard. His ruin was resolved on, and means were soon found to compass it. He was accused of complicity in a plot against the king; and though no jot of evidence of his being any way concerned in it was produced at his trial, a verdict was readily procured, finding him guilty of high treason. The language of the prosecutor, Attorney-general Coke, was outrageously abusive. He called R. 'a damnable atheist,' 'a spider of hell,' a 'viperous traitor,' &c. Sentence of death was passed, but James did not venture to execute him; and he was sent to the Tower, where, for thirteen years, he remained a prisoner, his estates being confiscated, and made over to the king's favourite, Carr, subsequently Earl of Somerset. During his imprisonment, he devoted himself to literary and scientific pursuits, his chief monument in this kind being his *History of the World*, a noble fragment, still notable to the student as one of the finest models of our quaint and stately old English style. Certain of his poetical pieces, giving hint of a genius at once elegant and sententious, also continue to be remembered, and are more or less familiar to every one. In 1615, he procured his release, and once more sailed for Guiana. The expedition, from which great results were expected, failed miserably. R. himself, in consequence of severe illness, was unable to accompany it inland; and nothing but disaster ensued. To add to his grief and disappointment, his eldest and favourite son was killed in the storming of the Spanish town of St Thomas, and he returned to England, broken in spirit and in fortunes. He returned only to die. On the morning of the 29th October 1618, in the sixty-sixth year of his age, he was infamously executed, nominally on the sentence passed on him sixteen years before, but really, there is reason to suppose, in base compliance on James's part with the urgencies of the king of Spain, who resented his persistent hostility.

R. was a man of noble presence, of versatile and commanding genius, unquestionably one of the most splendid figures in a time unusually prolific of all splendid developments of humanity. In the art and finesse of the courtier, the politic wisdom of the statesman, and the skilful daring of the warrior, he was almost alike pre-eminent. The moral elevation of the man shone out eminently in the darkness which beset his later fortunes; and the calm and manly dignity with which he fronted adverse fate conciliated even those whom his haughtiness in prosperity had offended. R.'s 'Life' has been written by Oldys, Cayley (2 vols., Lond. 1806), and P. F. Tytler (Edin. 1833); his poems were collected and published by Sir E. Brydges (Lond. 1814); his *Miscellaneous Writings*, by Dr Birch (2 vols. 1751), and his *Complete Works*, at Oxford (8 vols. 1829).

RA'LEIGH, the capital of North Carolina, is six miles west of the Neuse River, near the centre of the state; lat. 35° 47′ N., long. 78° 48′ W. The town is regularly built on an elevated site, with a central park, containing a large domed state-house, and broad streets. It contains a court-house, jail, 2 banks, 9 newspapers, 5 churches, deaf and dumb and lunatic asylums, and extensive railway connections. Pop. (1870), 7790.

RALLENTA'NDO (Ital., becoming slower), a musical term, abbreviated *rallent.*, or *rall.*, indicating a gradual relaxing or diminution of time.

RA'LLIDÆ, a family of birds of the order *Grallæ*, characterised by a long bill, which is more or less curved at the tip and compressed at the sides, the nostrils in a membranous groove, the wings of moderate length, the tail short, the legs and toes long and slender, the hind-toe placed on a level with the others. To this family belong rails, crakes, gallinules, coots, &c. The toes of some, as coots, are margined with a lobed membrane; but these are by some ornithologists separated from this family (see COOT). Even those R. of which the toes have no marginal membrane, are fitted, by the length of their toes, for walking on mud or ooze. Many of them swim and dive well. Most of them are aquatic, or frequent either fresh-water or salt marshes; but some, as the crakes, are found in dry situations.

RÂMA is, in Hindu Mythology, the name common to three incarnations of Vishn'u, of Paras'urâma, Râmachandra, and Balarâma. See VISHN'U.

RA'MADAN, the ninth month in the Mohammedan year. In it Mohammed received his first revelation, and every believer is therefore enjoined to keep a strict fast throughout its entire course, from the dawn—when a white thread can be distinguished from a black thread—to sunset. Eating, drinking, smoking, bathing, smelling perfumes, and other bodily enjoyments, even swallowing one's spittle, are strictly prohibited during that period. Even when obliged to take medicine, the Moslem must make some kind of amends for it, such as spending a certain sum of money upon the poor. During the night, however, the most necessary wants may be satisfied—a permission which, practically, is interpreted by a profuse indulgence in all sorts of enjoyments. The fast of R., now much less observed than in former times, is sometimes a very severe affliction upon the orthodox, particularly when the month—the year being lunar—happens to fall in the long and hot days of midsummer. The sick, travellers, and soldiers in time of war, are temporarily released from this duty, but they have to fast an equal number of days at a subsequent period, when this impediment is removed. Nurses, pregnant women, and those to whom it might prove really injurious, are expressly exempt from fasting. We may add, that according to some traditions (Al-Beidâwi), not only Mohammed, but also Abraham, Moses, and Jesus received their respective revelations during this month. The principal passages treating of the fast of R. are found in the second Surah of the Koran, called 'The Cow.'

RÂMÂYAN'A is the name of one of the two great epic poems of ancient India (for the other, see the article MAHÂBHÂRATA). Its subject-matter is the history of Râma, one of the incarnations of Vishn'u (q. v., and see RÂMA), and its reputed author is *Valmîki*, who is said to have taught his poem to the two sons of Râma, the hero of the history; and, according to this legend, would have been a contemporary of Râma himself. But though this latter account is open to much doubt, it seems certain that Valmîki—unlike Vyâsa (q. v.), the supposed compiler of the *Mahâbhârata*—was a real personage; and, moreover, that the R. was the work of one single poet—not like the *Mahâbhârata*, the creation of various epochs and different minds. As a poetical composition, the R. is therefore far superior to the *Mahâbhârata*; and it may be called the best great poem of ancient India, fairly claiming a rank in the literature of the world equal to

that of the epic poetry of Homer. Whereas the character of the *Mahâbhârata* is cyclopean, its main subject-matter overgrown by episodes of the most diversified nature, its diction differing in merit, both from a poetical and grammatical point of view, according to the ages that worked at its completion—the R. has but one object in view, the history of Râma. Its episodes are rare, and restricted to the early portion of the work, and its poetical diction betrays throughout the same finish and the same poetical genius. Nor can there be any reasonable doubt as to the relative ages of both poems, provided that we look upon the *Mahâbhârata* in the form in which it is preserved, as a whole. Whether we apply as a test the aspect of the religious life, or the geographical and other knowledge displayed in the one and the other work, the R. appears as the older of the two. Since it is the chief source whence our information of the Râma incarnation of Vishn'u is derived, its contents may be gathered from that portion of the article VISHN'U which relates to *Râmachandra*. The R. contains (professedly) 24,000 epic verses, or *S'lokas*, in seven books, or *Kând'as*, called the *Bâla-*, *Ayodhyâ-*, *Arañ'ya-*, *Kishkindhâ-*, *Sundara-*, *Yuddha-* (or *Lankâ-*), and *Uttara-Kând'a*. The text which has come down to us exhibits, in different sets of manuscripts, such considerable discrepancies, that it becomes necessary to speak of two recensions in which it now exists. This remarkable fact was first made known by A. W. von Schlegel, who, in Europe, was the first who attempted a critical edition of this poem; it is now fully corroborated by a comparison that may be made between the printed editions of both texts. The one is more concise in its diction, and has less tendency than the other to that kind of descriptive enlargement of facts and sentiments which characterises the later poetry of India; it often also exhibits grammatical forms and peculiarities of an archaic stamp, where the other studiously avoids that which must have appeared to its editors in the light of a grammatical difficulty. In short, there can be little doubt that the former is the older and more genuine, and the latter the more recent, and, in some respect, more spurious text. A complete edition of the older text, with two commentaries, was published at Madras in 1856 (in the Telugu characters, vol. i.—iii.); another edition of the same text, with a short commentary, appeared at Calcutta in two vols. (1860), and a more careful and elegant one at Bombay (1861). Of the later edition, Signor Gaspare Gorresio has edited the first six books (vol. i.–v., Paris, 1843—1850) without a commentary, but with an Italian, somewhat free, translation in poetical prose (vol. vi.—x., Paris, 1847—1858). Former attempts at an edition and translation of the R. remained unfortunately incomplete. The earliest was that made by William Carey and Joshua Marshman, who edited the first two books, and added to the text a prose translation in English and explanatory notes (vol. i.—iii., Serampore, 1806—1810; and vol. i., containing the first book, Dunstable, 1808). Another edition, of an eclectic nature, is that by A. W. von Schlegel; it contains the first two books of the text, and an excellent Latin translation of the first book and twenty chapters of the second (vol. i., parts 1 and 2, and vol. ii. part 1, Bonn, 1846). Various episodes from the R., it may also be added, have at various times occupied sundry editors and translators.

RAMBLA, a small town of Spain, in the modern province of Cordova, and 23 miles south of the city of that name, stands on a hill in a district which produces abundantly grain, wine, and oil. Some manufactures of coarse pottery, especially of porous water-coolers, are carried on. Pop. 6500.

RAMBOUILLET, CATHERINE MAGDELEINE DE, one of the most accomplished and illustrious women of the 17th c., was born at Rome of Italian parents in 1588, and received a refined education under the superintendence of her mother, the Marchesa di Pisani. At the age of 12 she was betrothed to a French nobleman, Charles d'Angennes, son of the Marquis de Rambouillet, who succeeded to the family estates and title on the death of his father in 1611. When the youthful marquise first appeared in the assemblies at the Louvre, she was shocked by the gross corruption of manners and morals that prevailed among the nobility of each sex, and almost immediately conceived the idea of forming a select circle for herself, in a part of her own house—the famous Hôtel de Rambouillet. Madame de R. was admirably fitted for presiding at the reunions which have made her name famous in the literary history of France. Handsome and gracious, but free from coquetry and all personal pretensions, her affability, generosity, and steadfast attachment to her friends, made her an object almost of worship to those who enjoyed her society. The writers of that epoch are unanimous in the expression of their homage. The characteristic feature of the Rambouillet circle was the intercourse, on terms of equality, of the aristocracy of rank and the aristocracy of genius. *There*, for the first time, do we meet with a generous and adequate recognition of the dignity of letters. For fifty years the salons of the marquise were hospitably open to the wits, critics, scholars, and poets of Paris, beginning with Malherbe and Racan, followed by that distinguished circle of *beaux-esprits* who contributed so much to the formation of the French language and taste—Chapelain, Sarrasin, Conrart, Patru, Balzac, Segrais, Gombaud, Voiture, and Corneille; and closing with the generation who filled up the interregnum from Corneille to Molière, Scarron, Saint-Evremond, Benserade, the Duc de Larochefoucauld, &c. Many of the literary débuts of celebrated geniuses were made at the Hôtel de Rambouillet. Here Corneille read his first piece, *Mélite*, and Armand du Plessis, afterwards Cardinal Richelieu, recited a *Tragédie d'Amour*, and Bolcan preached one of his earliest sermons. But the Hôtel was almost as much renowned for the brilliant and accomplished women who frequented it, as for its crowd of professional litterateurs. The names of Mademoiselle de Scudéry, of Mademoiselle Cathos—afterwards Comtesse de la Suze—and of the Marquise de Sablé, who inspired the *Maximes* of Larochefoucauld, are among the most distinguished of their time and country; but above them all, as conspicuous by her splendid beauty as by her faultless grace of manner, the centre and idol of both sexes, shone the sister of the great Condé, and the heroine of the Fronde, the Duchesse de Longueville. The combined influence of so many different sorts of *esprit* exercised a profound and lasting influence on the literature and society of the 17th c., and is considered rightly, as we think, to have developed quite a new art—that of lively, pointed conversation, in which France has ever since taken the lead, and has thus placed itself entirely in the front of European civilisation. It has been customary to say that the *Précieuses Ridicules* of Molière was aimed at the females of the Rambouillet circle. But this notion has been shown to be entirely groundless. The *Précieuses Ridicules* was actually first performed at the Hôtel, and Molière, in the preface to his *Femmes Savantes*, protests against the supposition that he meant to reflect on a circle which he affirmed had every claim to respect. It appears from investigation, that grotesque imitations of the manners and style of the Hôtel had, in the course

of years, become prevalent both in Paris and the provinces, and that it was these, and not their charming prototype, which were exposed to the satire of Molière. Madame de R. died at Paris, 2nd December, 1665.—See Röderer's *Mémoire pour servir à l'Histoire de la Société polie en France pendant le dix-septième Siècle*; and Victor Cousin's *Jeunesse de Mde. de Longueville, Mde. de Sablé, &c.*

RAMEAU, JEAN PHILIPPE, an eminent French musician, born at Dijon, in 1683, and son of the organist of the Sainte Chapelle there. He shewed a genius for music almost from infancy, and with the view of devoting himself to it as a profession, set out for Italy at the age of 18, but proceeded no further than Milan. After travelling through France, and acquiring a considerable reputation as a performer on the organ, he was appointed organist of the cathedral of Clermont, in Auvergne, and wrote while there his *Traité de l'Harmonie*, a work of some note in musical literature, which was published in Paris in 1722. Removing to Paris, he became organist of Sainte Croix de la Bretonnerie, and published various other treatises connected with the theory of music. In 1733, at the mature age of 50, he produced his first opera, *Hippolyte et Aricie*, the drama of which was written by the Abbé Pellegrin. It created a great sensation, and R. was forthwith elevated to the position of a rival to Lulli as an opera composer, musicians being divided in their partisanship of the two artists. R.'s best opera was *Castor et Pollux*, produced at the Académie Royale de Musique, in 1737; it contains one chorus which has hardly been surpassed in the whole range of theatrical music. Between 1733 and 1760, he composed 21 operas and ballets, as well as numerous harpsichord pieces. His works on harmony acquired for him a deservedly high reputation as a musical theorist; he has been called the Newton of musical science. Louis XV. created for him the office of Cabinet Composer, granted him letters of nobility, and named him a Chevalier de St Michel. R. died in 1764.

RAMESSES, RAMESES, or RAMSES, the name of several Egyptian monarchs, some of whom were known to the Greek and Roman writers and the chronologists; the name signifies 'born of the sun' or the 'nascent sun.' The R. family is supposed to have been of Theban origin, and to have been descended from one of the later queens of the 18th dynasty. The exploits of R. are confounded by the Greek and Roman authors with those of Sesostris (see SESOSTRIS), and mingled in the legend of Armais, the Danaus of the Greeks. R. is said to have had a great army and navy, and at the head of a force of 700,000 men, to have conquered Ethiopia, Libya, Persia, and other eastern nations. Before leaving his kingdom for these distant expeditions, he is said to have appointed his brother Armais or Danaus regent of the kingdom, charging him neither to assume the diadem, nor interfere with the royal harem. R. then proceeded to conquer Cyprus, Phœnicia, the Assyrians and Medes. Armais contravened his orders; and R., informed of this by the high priest, suddenly returned to Pelusium, and resumed the kingdom, expelling his brother, who, fleeing with his daughters, the Danaids, to Argos, established himself in Greece. According to the Roman authors, however, Troy was taken in the reign of Rameses. The walls of the temples of Thebes were said to be covered with inscriptions and scenes recording his conquests and the tributes rendered to him, and these were interpreted to Germanicus by the priests on his visit to Egypt. Such is the account given of a monarch called R. by the classical authors. The following are the principal princes and monarchs of this name, found on the monuments of Egypt. 1. A prince or king represented with the royal families of the 18th dynasty in a sepulchre at Thebes.—2. R. I., chief of the 19th dynasty, who reigned but a short time, and whose name is found on the monuments of Thebes and the Wady Halfa.—3. R. II., or Great, who mounted the throne at a very early age, conquered the Khita or Hittites, and other confederate nations of Central Asia, in his 7th year, and concluded an extraditionary treaty with the Khita in his 21st year. Other nations, European and African, fell under his sway, and his empire extended far south in Nubia, the ancient Ethiopia, which he governed by viceroys. He erected fortresses and temples in foreign lands, and embellished all Egypt with his edifices. He had two wives, twenty-three sons, and seven daughters, and was finally buried in the Biban-El-Melook. He is the supposed Sesostris, according to most authors. He reigned 68 years.—4. R. III., chief of the 20th dynasty, the Rhampsinitus of Herodotus, called Meriamoun, or beloved of Ammon, who defeated the Philistines, the Mashuash, and the Libyans, carrying on important wars from the 5th to the 12th year of his reign; he also made conquests in the 16th, and seems to have reigned 55 more years. He founded the magnificent pile of edifices of Medinat Habu, embellished Luxor, Gurnah, and other parts of Egypt. Some attribute to him the exploits of the R. of the Greek and Roman writers—5. R. IV. reigned a short time, and performed no distinguished actions.—6. R. V., of whom inscriptions are found at Silsilis.—7. R. VI., whose tomb at the Biban-El-Meluk contains some astronomical records from which the date of his reign has been calculated at 1240 B. C.—8—12. R. VII., VIII., IX., X., and XI., undistinguished monarchs.—13. R. XII., who reigned above 33 years, in whose reign the statue of the god Chons was sent from Egypt to the land of the Bakhten, to cure a princess of the royal family of that court, with which R. had contracted an alliance.—14. R. XIII., an unimportant monarch.

RAMESES is also the name of one of the fortresses or treasure-cities built by the Hebrews during their residence in Egypt. The name of this fortress, all important for the date of the Exodus—placed 1491 B. C. by the old chronologers, and 1314 B. C. by Lepsius—is found in the papyri of the British Museum in documents of the age of Meneptah, while R. III. is represented at Medinat Habu in one of his campaigns marching out of the Magdol of Rameses. The situation of Rameses has much puzzled geographers and commentators, and it has been supposed to be Abaris, Baal-Zephon, Heroonpolis, Pelusium, and Abu-Kescheh. Notwithstanding the opposition to dating Fort Rameses in the period of the 19th dynasty, it is now generally admitted to have been constructed at that period. In fact, no fort was ever named by the appellation of a prince, it being the prerogative of the monarch to have the fortresses named after him. Nor is it possible to suppose the name Rameses changed for another older name in the Mosaic writing, without impugning the text; and the evident solution of the difficulty is, that the Exodus of the Hebrews took place under a king Rameses, at whatever chronological period his reign may have happened.—Exodus, i. 11; Lepsius, *Einleit*, 336, and foll.; Chabas, *Mélanges*, 2d series, p. 108; Brugsch, *Histoire d'Egypte*, p. 126; Champollion-Figeac, *L'Egypte*, p. 322.

RAMILLIES, an inconsiderable village of Brabant, Belgium, 13 miles north of Namur, and 28 miles south-east of Brussels, is memorable as the

place near which one of the most important battles of the War of the Spanish Succession was fought, May 23, 1706. In this conflict, the French forces were under the command of Marshal Villeroy and the Elector of Bavaria, while Marlborough led the troops of the Allies. Villeroy, after a battle of three hours and a half, was defeated, with the loss of almost all his cannon, the whole of his baggage, and 13,000 men in killed and wounded. The great result of this victory was that the French were compelled to give up the whole of the Spanish Netherlands.

RAMMELSBERG, one of the Harz Mountains, rather less than 2200 feet high, and celebrated for its mines, which yield gold, silver, lead, zinc, copper, sulphur, vitriol, and alum. They have been worked, according to tradition, from the year 968; and their possession was for ages a source of strife between the inhabitants of Goslar (q. v.) and the Dukes of Brunswick.

RAMMOHUN ROY, a celebrated Hindu rajah, was born at Bordwan, in the province of Bengal, between 1774 and 1780. In a sketch of his own life, written in 1832, he states that his ancestors were Brahmans of a high order. At home, he acquired the usual elements of native education, with some knowledge of the Persian language. At Patna, and afterwards at Benares, he studied Sanscrit, and the works written in it, which contain the spirit of Hindu law, literature, and religion. At a very early age, he began to compare the evidence for and against the various religious doctrines held by those around him; nor did he except from this investigation those doctrines in belief of which he himself had been brought up. Finding them all repugnant to his vigorous understanding, he boldly acknowledged this fact both to himself and to the world. The result was a quarrel with his father, his family, and his community. He appears, indeed, to have succeeded in converting the understanding of his mother; but it, in its turn, was overcome by her sentiment. 'You are right,' she said to him, when she was about to set out on a pilgrimage to Juggernaut; 'but I am a woman, and cannot give up observances which are a comfort to me.' R. R. spent two or three years of his youth in Tibet, where he excited general anger by denying that the Lama was the creator and preserver of the world. For a long time, he had a strong, and, perhaps, not unfounded dislike to the English; but becoming convinced that their sway was, on the whole, beneficial to India, his views changed, and he applied himself to the study of the English language. For five years, he held the office of Revenue Collector in the district of Rungpoor. In 1803, his father died, but left him no part of his estate. In 1811, however, by the death of his brother, he succeeded to affluence. 'After my father's death,' he says, 'I opposed the advocates of idolatry with still greater boldness.' He published various works in Persian, Arabic, and Sanscrit; the object of the whole being the uprooting of idolatry. His principal work, called the *Vedant*, is a digest of, and comment on, the Vedas, the ancient writings which embody the theology of the Hindus. Becoming more convinced, as he grew older, of the excellence of the moral theories of Christianity, in 1820 he published *The Precepts of Jesus, the Guide to Peace and Happiness*. It appears from this work, that while he believed in the morality preached by Christ, he did not believe in the divinity of the preacher. He rejected the miracles also, and other portions of the gospels held to be fundamental in the various churches of Christendom. The book, therefore as was to have been expected, met with severe ecclesiastical censure, the grounds of censure being various and unstinting. In April 1831, the rajah visited England. The great question of parliamentary reform was then agitating the country. Of the Reform Bill he wrote, that it 'would, in its consequences, promote the welfare of England and her dependencies, nay, of the whole world.' His society was universally courted in England. He was appointed with permission to attend social parties and political and commercial meetings. His activity to see everything and to please all, led him to overtask himself to such an extent that his health, long failing, at last quite broke down. He died at Bristol, September 27, 1833. The adverse circumstances of the time were such as might easily have enslaved even his powerful understanding, or still more easily, might have perverted it to selfish ends; but he won his high position by an indomitable honesty of purpose and energy of will. [illegible] by himself, in the *Athenæum*, No. 310, October 5, 1833; also *Chambers's Edinburgh Journal*, August 2, 1834.

RAMNEGHAR, or RAMNUGGUR (Town of Gnjr, formerly called Ramnuggur), a large town of the Punjab, beautifully situated on an extensive plain on the left bank of the Chenab, 63 miles south-north-west of Lahore. There is here a ferry across the river, which is 500 yards wide, and 9 feet deep; but two miles lower there is a ford, at which the depth is only 3 feet, when the water is at its lowest. The town is surrounded by walls and contains eight well-supplied bazaars. Pop. stated at 11,000.

RAMNEGHAR, or RAMNUGGUR, a town of British India, in the district of Benares, and four miles south of the city of that name, on the right bank of the Ganges. Its fort, the residence of the rajah, rises from the banks of the sacred stream by a number of fine ghâts or flights of stairs. Pop. 9490.

RAMP, a sudden upward curve in the hand-rail of a stair.

RAMP, in Fortification, is a gradual slope by which approach is had from the level of the town or interior area to the terreplein or general level of the fortifications behind the parapet.

RAMPANT (Fr. literally, 'raging'), in Heraldry, an epithet applied to a lion or other beast of prey when placed erect on the two hind legs, with only one of the fore-legs elevated, the head being seen in profile. When the face is turned towards the

Rampant.

spectator, the attitude is called *rampant gardant*; and when the head is turned backwards, *rampant regardant*. A lion *counter-rampant* is one rampant towards the sinister, instead of towards the dexter, the usual attitude. Two lions rampant contrary-ways in salter, are sometimes also said to be counter-rampant.

RAMPART, forms the substratum of every permanent fortification. See FORTIFICATION. It constitutes the enceinte, and is constructed immediately within the main ditch by throwing up the

soil excavated from it. On the front of the rampart, the parapet is raised, and width should be left behind it to allow of guns, wagons, and troops passing freely on the top of the rampart. The height of the rampart is dependent on the relief (height) of the buildings to be defended, and on the positions in the neighbourhood which an enemy might assume.

RAMPHAS'TIDÆ. See TOUCAN.

RAMPION (*Campanula rapunculus*; see CAMPANULA), a perennial plant, a native of Europe, rare in England, with a stem about two feet high, and a panicle of very pretty pale-blue bell-shaped flowers. The radical leaves are ovate-lanceolate and waved. The root is white and spindle-shaped, and was

Rampion.

formerly much used for the table, under the name of *Rampion* or *Ramps*. The plant is now little cultivated in Britain, but is still commonly cultivated in France for the sake of its roots, which are used either boiled or as a salad, and of its young leaves, which are also used as a salad.

RAMSAY, ALLAN, an eminent Scottish poet, was born in the parish of Crawford, Lanarkshire, October 15, 1686. His father was manager of Lord Hopetoun's mines at Leadhills, and his mother, Alice Bower, was the daughter of a Derbyshire miner. To this maternal descent, we may perhaps trace Allan's peculiar frankness and gaiety of temperament. In his 15th year (by which time he had lost both of his parents), he was put apprentice to a wigmaker in Edinburgh. He had received the ordinary education of a parish school, and could read Horace, as he says, 'faintly in the original.' Up to his 30th year, he continued to follow the occupation of a wigmaker; and by this time, he had become known as a poet, having issued several short humorous pieces, printed as broadsides, and sold for a penny each. He had also written (1716—1718) two additional cantos to the old Scots poem of *Christ's Kirk on the Green*, attributed to James I. These two cantos gave such genuine pictures of rustic life, and presented such felicitous scenes of broad humour, that it was obvious their author was destined to become the restorer of Scottish poetry. Patronised by the highest and worthiest of the land, R. now abandoned wigmaking, and commenced business as a bookseller. His shop was 'opposite Niddry's Wynd,' and he placed a sign of Mercury over his door. Subsequently, as his success increased, he removed to the Luckenbooths, and deposing Mercury, set up heads of Drummond and Ben Jonson. He also added to his business a circulating library, the first established in Scotland. From 1718, when he opened shop as a bookseller, down to 1755, when he retired to a villa of his own erection, R.'s career, worldly and literary, was eminently prosperous. He was careful and industrious, determined, he said, to shew the world that *poortith*, or poverty, was not 'the poet's lot;' and though he was always courting patronage, he never selected a fool for his patron, nor did his pride and vanity as a poet ever withdraw him from business. The following are his principal works: *Tartana, or the Plaid*, 1721; a collected edition of his *Poems*, published by subscription in 1721, by which it is said the poet realised 400 guineas; *Fables and Tales*, 1722; *Fair Assembly*, 1723; *Health, a Poem*, 1724; *The Tea-table Miscellany*, a collection of the most choice songs, Scottish and English, 1724, to which a second volume was published in 1725, a third in 1727, and a fourth in 1740; *The Evergreen*, 'being a collection of Scots Poems wrote by the Ingenious before 1600,' published in 1724; *The Gentle Shepherd, a Pastoral Comedy*, 1725, to which songs were added in 1728; a second collection of *Poems* published by subscription, 1728; *Thirty Fables*, 1730. Of most of these publications, numerous editions were called for, no less than nine of the *Tea-table Miscellany* being issued in nine years. One brief cloud overcast the poet's successful career. He entered into a speculation for the encouragement of the drama, and built a theatre in Edinburgh, which was almost immediately shut up by the magistrates, in virtue of the act passed in 1737 prohibiting all dramatic exhibitions without special licence. This affair was a serious loss to the poet, and subjected him to the annoyance of attacks from poetasters and morose religionists, such as 'A Looking-glass for Allan Ramsay,' 'The Dying Words of Allan Ramsay,' 'The Flight of Religious Piety from Scotland upon the account of Ramsay's Lewd Books and the hell-bred Playhouse Comedians,' &c. Allan bore all with Horatian philosophy and indifference; but he addressed a poetical epistle to his friend, Duncan Forbes of Culloden, then Lord Advocate, claiming compensation for his losses, or, at least, that he might be 'edged into some canny post.' This request does not seem to have been complied with, but Allan had amassed a decent competency. The last two or three years of his life were spent in cheerful retirement in the quaint but picturesque house he had built on the north side of the Castle Hill, and there he died on the 7th of January 1758. He had the gratification of seeing his only surviving son, ALLAN RAMSAY (born in 1713, died in 1784), fast rising into distinction as a portrait-painter, and esteemed by the most eminent men of his day as an accomplished scholar and gentleman. This second Allan Ramsay had been carefully educated by his father, and sent to Rome to study art. On his return, being introduced to the Prince of Wales, afterwards George III., he rapidly rose into favour; and in 1767 was appointed principal painter to the king.

The *Gentle Shepherd* of R. is his greatest work, and, indeed, is esteemed as the best pastoral in any language. Its characters are realities, not shadowy Corydons or Phyllises, maundering over crooks, or sleeping to the murmur of bees. It contains faithful transcripts of actual life and feeling, such as the poet had witnessed in his youth on the banks of the Clyde and Glengonar. The poetry, too, abounds in graphic expression and touches of homely nature and arch humour, that to Scotsmen are irresistible, while the plot is skilfully constructed, and brings out rustic character, customs, and superstitions. Some of R.'s tales and fables are amusing,

but coarse. His songs also are occasionally defective in respect of simplicity and delicacy, though he has made some exquisite additions to our lyrical poetry. In his Jacobite allegory, *The Vision*, he rises into the higher region of inspiration, apparently inspired, and certainly rivalling Dunbar. As an editor, he has been censured for tampering with the works of the old bards, retouching, adding, or retrenching at his pleasure. But he also rescued many choice productions of the elder muse from neglect, and awakened in Scotland a taste for its native literature. A complete edition of his poems with a biography was published by George Chalmers (2 vols., 1800). The latest edition—very correct—appeared at New York in 1854.

RAMSDEN, Jesse, a celebrated instrument-maker, was born at Salterhebble, near Halifax, Yorkshire, in 1735. He received a good education, and, after being engaged as a cloth-worker, and become (1762) a working engraver and divider in London, and having married Dollond's (q. v.) daughter, received, as her dowry, a share in his father-in-law's patent for achromatic telescopes. The sextants of his time were very imperfect, being untrustworthy within 5′ of a degree, and R. succeeded in reducing the possible error to within 30″. His skill thus shewn, and the cheapness of his instruments (two-thirds of the price charged by other makers), soon created such a demand as tasked his utmost energy to meet. To increase the amount and improve the quality of the work done by his men, he introduced the principle of the division of labour, besides inventing a dividing-machine, which could graduate instruments much more rapidly and accurately than could be done by hand. For this invention, he received from the Board of Longitude a premium of £615. He constructed the theodolite used by General Roy (q. v.), and also telescopes for the observatories of Blenheim, Mannheim, Dublin, Paris, and Gotha, and mural quadrants for those of Padua and Vilna, the accuracy of all of which was a matter of admiration and delight among astronomers. He was one of those who strongly recommended the introduction of the mural circle in place of the Quadrant (q. v.), and he constructed two of the former instruments for the observatories of Palermo and Dublin. The minor scientific instruments invented or improved by him are also numerous. He died at Brighton, 5th November 1800, leaving a moderate fortune, a large portion of which was, in accordance with the terms of his will, divided among his workmen. R. was a member of the Royal Society, a Fellow of the Imperial Academy of St Petersburg, and the possessor of a Copley medal (the gift of the Royal Society).

RA'MSEY, a town in the Isle of Man, lying 16 miles north of Douglas, and which, from the beauty of its situation and the salubrity of its climate, is rapidly becoming a favourite resort of tourists and pleasure seekers. It stands on the margin of a spacious bay, and has a background of lofty and well-wooded hills. The anchorage in the bay is good, and the waters abound in mackerel, herrings, salmon, and other fish. An extensive ship-building yard has recently been opened here, which gives occupation to about 300 men. A steam-packet plies between Liverpool and R. three times a week in the summer, and once a week in winter, and between Whitehaven and R. twice a week in summer and once a week in winter. Pop. (1861) 2839.

RA'MSGATE (*Rium's* Gate; *Rium* is the British name of Thanet), a seaport, market-town, and favourite watering-place in the county of Kent, in the south-east of the Isle of Thanet, 97 miles

RAMSHORNS, in Fortification, are semicircular works of low profile in the ditch, which they sweep, being themselves commanded by the main works. They were invented by M. Belidor, a great French engineer, and when used, take the place of Tenailles (q. v.).

RA'MSKIN, a species of cake, which consists of grated cheese of some dry kind, such as Parmesan or the white hard English varieties, incorporated with dough as prepared for fine puff pastry, then rolled out, and cut into shapes, glazed with white of egg, and baked for a quarter of an hour. It is usually eaten hot. This dish is said to have been invented at Croxteth Hall, the seat of Lord Sefton, whence it is sometimes called 'Sefton fancy.'

RAM-TIL (*Guizotia oleifera*), a plant of the natural order *Compositæ*, suborder *Corymbiferæ*, a native of the East Indies and Abyssinia, much esteemed for the bland oil which is obtained from the seeds, and which is employed for the same purposes as olive oil. The R. is extensively cultivated in India, chiefly in Mysore, and to some extent also in Abyssinia.

RAMUS (Latinised form of *La Ramée*), Peter, an illustrious French 'humanist,' was the son of a poor labourer, and was born at the village of Cuth, in Vermandois, in 1515. His thirst for knowledge was so great, that twice before he had reached his 12th year, he travelled on foot to Paris, with the hope of getting into some school there, but the misery of want twice drove the brave boy home again. In his 12th year, however, he got a situation as servant to a rich scholar at the College de Navarre; and by devoting the day to his master, obtained the night for study, and made rapid progress. The method of teaching philosophy then prevalent disgusted him, and he was gradually led to place a higher value on 'reason' than on 'authority,' contrary to the mental habit of his time. His contempt, indeed, for 'authority' blinded him, as is often the case with a young reformer, to the truth 'authority' might contain, and when [illegible] his degree of M.A., in his 21st year, he maintained

the extravagant thesis, that 'all that Aristotle had said was false' (*quæcunque ab Aristotele dicta essent, commentitia esse*). It says a great deal for the ability he shewed on this occasion, that his judges, although themselves Aristotelians, were compelled to applaud him. Immediately after, R. became a teacher in the Collége du Mans, and along with two learned friends opened a special class for reading the Greek and Latin authors, designed to combine the study of eloquence with that of philosophy. His audience was large, and his success as a teacher remarkable. He now turned his attention more particularly to the science of logic, which, in his usual adventurous spirit, he undertook to 'reform;' and no one acquainted with his system, will deny that many of his innovations were both rational and beneficial. His attempts excited much hostility among the Aristotelians, and when his treatise on the subject (*Dialecticæ Partitiones*) appeared in 1543, it was fiercely assailed by the doctors of the Sorbonne, who managed to get it suppressed by a royal edict, and even barbarously demanded that its author should be sent to the galleys. But R. had (at this time) two powerful friends, Cardinals Charles de Bourbon and Charles de Lorraine, who protected him from personal injury, and through whose influence he was, in 1545, appointed principal of the Collége de Presles, which he raised from a condition of decay to the most splendid prosperity. In 1551, Cardinal Lorraine succeeded in instituting for him a chair of Eloquence and Philosophy at the Collége Royal; and his inaugural address (*Pro Philosophica Disciplina*, Par. 1551) is reckoned a masterpiece of the kind. He devoted the first eight years of his teaching to the first three of the 'liberal arts' (Grammar, Rhetoric, and Logic), which he called elementary or exoteric, and published three grammars successively, Greek, Latin, and French. He also mingled largely in the literary and scholastic disputes of the time, and on account of his bustling activity, came under the satire of Rabelais. But though R. had innumerable adversaries, he might have defied them all, so great was his influence at court, had his love of 'reformation' not displayed itself in 'religion' as well as in logic. In an evil hour (for his own comfort), he embraced Protestantism. He had long been suspected of a leaning that way, and, as we have seen, his intellect was by nature scornfully rebellious towards the *ipse dixit* of 'authority;' but he had for years decently conformed to the practices of the Catholic cult, and it was only after Cardinal Lorraine, in reply to the Conference of Poissy (1561), frankly admitted the abuses of the church and the vices of the clergy, that he ventured formally to abjure the older faith. The outbreak of the religious wars in France plunged him into the dangers of the time, and he finally perished in the fatal massacre of St Bartholomew, August 1572. It is believed that he was assassinated at the instigation of one of his most violent and persistent enemies, Charpentier, Rector of the Collége de Presles.

R. holds a most honourable place in the list of intellectual reformers. His assault on scholasticism as a *method of thinking* is vigorous, and, on the whole, well directed; his exposure of its puerile and useless subtleties is thorough, and entirely in accordance with later criticism. In his contempt for the illiterate worship of Aristotle, in his admiration of Plato and of the ancient orators and historians, he ranks (though late) with the scholars of the Renaissance; but in his assertion of 'reason' as the supreme criterion of truth, he must be regarded as the forerunner of Descartes and the modern world. His system of logic, by which perhaps his name is best known, is marked by its lucid definitions, its natural divisions, and its simplification of the rules of the syllogism; but (like every pre-Baconian system) it fails to realise the supreme importance of the inductive method. What strikes one most, however, in R. is not so much his particular achievements, as his universal intellectual activity: He was the first mathematician of his age in France, and wrote treatises on arithmetic, geometry, and algebra, which were text-books for a hundred years; he was among the earliest adherents of the 'Copernican' system of astronomy, and in natural philosophy avowed himself an enemy to hypotheses and abstractions; rhetoric, morals, theology, all engaged his pen, and he seldom handled a subject which he did not to some degree elucidate. His followers were a widespread, and for long a powerful body of thinkers and teachers. France, England, the Low Countries, Germany, Switzerland, Denmark, and even Spain, had their *Ramists*, as they were called, and they have disappeared chiefly because their tendencies are embraced in the broader and more critical methods of modern scientific inquiry. A list of his writings is given in the *Nouvelle Biographie Universelle*, article 'Ramus.'—See Waddington's *Ramus, sa Vie, ses Ecrits, et ses Opinions* (Paris, 1855); E. Saisset's *Les Précurseurs de Descartes* (Paris, 1862); and C. Desmaze's *P. Ramus, Professor au Collége de France, sa Vie, ses Ecrits, sa Mort* (Paris, 1864).

RA'NA and RA'NIDAE. See FROG.

RANCÉ, ARMAND JEAN LE BOUTHELIER DE, the well-known founder of the reformed order of La Trappe (see TRAPPISTS), was born January 9, 1626, at Paris, where he was educated. Having taken his degree in the Sorbonne with great applause, and embraced the ecclesiastical profession, he soon became distinguished as a preacher, and through the favour of Cardinal Richelieu, obtained more than one valuable benefice. He succeeded, while yet a young man, to a large fortune, and for a time, notwithstanding his clerical character, was carried away by the gaiety and dissipation of Parisian life. After a time, however, having forfeited the favour of Cardinal Mazarin, and being deeply moved by the death of a lady, the Duchess de Montazon, to whom he was much attached, he withdrew from Paris, and after a time resolved to sell all his property, to distribute the proceeds among the poor, and to devote himself exclusively to the practice of piety and penitential works. Finally, he resigned all his preferments (of which, by the abusive practice of the period, he held several simultaneously), with the exception of the abbacy of La Trappe, to which convent he retired in 1662, with the intention of restoring the strict discipline of the order. The history of the reforms which he effected will be found under the head TRAPPIST. He lived in this seclusion for 33 years, during which he published a large number of works, chiefly ascetical. The only remarkable event of his literary life was his controversy with Mabillon, in reply to his *Etudes Monastiques*, on the subject of the studies proper for the monastic life. R.'s work is in 4to, 1692. In his youth, he had edited *Anacreon*, in one volume octavo (Paris, 1639), with a dedication to Cardinal Richelieu. He died October 27, 1700.

RANCHE'ROS (from the Spanish *rancho*, comradeship) is the name given in Mexico to a mixed breed of Spanish and Indian blood, who inhabit the country, and may almost be said to live in the saddle from their youth, are splendid riders and hunters, and form the bravest part of

the Mexican army—its irregular cavalry. The importance of their services was seen in the wars with the United States. The R. are lank in frame, with brown weather-stained faces and muscular limbs, hardy, temperate, and always ready for the boldest enterprises. They practise polygamy.

RANCIDITY. See Oils and Fats.

RANDERS, a town in Jutland, chief town of the *Amt* or bailiwick of the same name, is situated on the Guden, at its entrance into the Randers Fiord, 20 miles from the mouth of the latter in the Cattegat. Though still fortified, it has much declined from its early *prestige* and importance. Brewing, distilling, and the manufacture of gloves, which are in high repute, and of stockings and cloth, are carried on. Pop. 8844.

RANDOLPH, John, of Roanoke, an American statesman, was born at Cawsons in Chesterfield County, Virginia, June 2, 1773. He was descended from an ancient and wealthy family, and boasted that the Indian princess Pocahontas was one of his ancestors. Educated at Princeton and Columbia Colleges, he embraced the profession of the law, and in 1799 was elected to Congress, where he became distinguished for his eloquence, wit, sarcasm, invective, and eccentricity, and for thirty years was more talked and written of than any American politician. Tall and meagre, peculiar in dress and manners, he was described as a strange mixture of the aristocrat and the Jacobin. He was the Democratic leader of the House of Representatives, but quarrelled with Jefferson, and opposed the war of 1812, and the Missouri Compromise, and stigmatised the Northern members who voted for it as 'Doughfaces.' In 1822 and 1824, he visited England, where his eccentricities attracted much notice. In 1825, he was chosen United States' senator from Virginia, and in 1830 appointed Minister to Russia. By his will, he manumitted 318 slaves, and provided for their maintenance in a free state. He died in Philadelphia, June 24, 1833. See *Life of John Randolph*, by Garland (2 vols., New York, 1850); J. Parton, *Famous Americans of Recent Times*, 1869.

RANGE, in Gunnery, is the distance between a point on the ground vertically below the muzzle of the piece and the point on the same level at which the projectile touches in its descent. The point-blank range is when the piece is fired in a horizontal position; the range then increases with the elevation; and if the air opposed no resistance, the greatest range would be attained with the piece elevated at an angle of 45°; but in practice this angle is found to be, on an average, a little over 30°. As the resistance of the atmosphere increases as the square of the velocity of the shot, being also in the direct ratio of its front section, while the momentum is as the velocity multiplied by the weight; it follows that a heavy shot should have a greater range than a light one; and that of two shots of the same weight, an elongated cylinder of small diameter will have a longer range than a spherical ball of greater diameter. On the other hand, from the rapid increase in a duplicate ratio of the resistance, as compared with the initial velocity, the range only increases to a certain point, in consequence of a more rapid flight of the projectile. The longest range yet attained has been by Mr Whitworth with a 12-pounder rifled cannon, with which he sent a bolt 10,300 yards—only 260 yards short of 6 miles!

RANGOON, the principal seaport and chief town of Pegu (q. v.), is built on the left bank of the Rangoon River, the eastern branch of the Irrawaddi, at the distance of 26 miles from the sea in lat. 16° 47′ N., and long. 96° 10′ E.* It was founded or erected by the great Alompra in 1755. The British flag was first planted in the town, May, 1824, when the Anglo-Indian troops took possession of it at the commencement of the first Burmese war. The second Burmese war began with the bombardment of R. April 11, 1852, and it was captured, April 14, by the united forces of Bengal and Madras. At the close of the present Pegu was annexed to British India, and R. became a part of the same territory. According to an estimate made in 1855, the inhabitants of R. amount to 46,000 souls, irrespective of a large floating population. A great change has taken place in R. under the auspices of the British, and large sums have been expended on its improvement. Capital roads and streets now intersect every part of the town. The native town is of a very mean appearance, but many substantial buildings of brick or stone have been erected by the European inhabitants. It possesses a government navy yard, and is the chief port of foreign trade in British Burmah.

R. is a stronghold of Buddhism, and on every side are seen gigantic monuments that from age to age have been erected by the followers of Gaudama—pagodas, temples, images, wonderful in their vastness and grotesque splendour. Of these, the most notable is the famous Shoay Dagon, or Golden Dagon dagoba, or shrine, the foundations of which is said to have been laid 2000 years ago. It lies about two miles north of the town, on elevated ground, and the area on which it stands is 900 feet square. The dagoba itself is a stupendous mass of solid masonry, tapering gradually from an octagonal base of 1355 feet to a spire of small circumference, which is surmounted by the sacred tee, or umbrella of open iron-work. The whole building is one dazzling blaze of gold, and altogether forms a most magnificent object, its beautiful and imposing effectiveness being very remarkable. This celebrated monument derives its peculiar sanctity from being the depository, according to Burman tradition, of relics of the last four Buddhs—viz. the staff of Kau-tha-than, the water-dipper of Gau-na-gon, a garment of Ka-tha-pa, and eight hairs from the head of Gaudama. The shrine is surrounded by numerous temples, containing colossal images of Gaudama, richly gilt, and sitting in solemn cross-legged, like so many tailors at a Quakers' meeting.

R., possessing a continuous water communication with the upper provinces and the Burman kingdom, is very favourably situated for internal as well as for foreign commerce. Teak-timber, and rice are the principal exports by sea, but they also include copper, raw cotton, Cutch boles, ivory, lead, yellow orpiment, petroleum, precious stones, shell lac, and tobacco. The imports by sea consist of metal ware, cotton twist, cotton piece goods, silk and woollen piece goods, raw silk, spirituous liquors, and wines. For the official year 1866—7 the value of exports from R. was 32,171,191 rupees, and of imports, 23,888,166 rupees.—Winter's *Six Months in Burmah* (Lond., 1858); McCulloch, *Com. Dict.* (1859).

RANK.—*Army rank* is somewhat confusing, from its varieties, and from the fact that the same officer may hold at once three different ranks. The first and only rank up to the grade of captain is regimental or *substantive* rank. Above this, officers may advance in two ways: first, up to the rank of lieutenant-colonel by substantive or regimental rank; second, up to colonel by obtaining rank in the army, generally called *brevet rank*, and above that by army rank through the several grades of general officer. In his regiment, the officer holds only his regimental

* This is the situation of the great pagoda

rank, whatever his brevet rank may be; but among officers of the army generally he takes precedence according to his brevet rank. In describing an officer who has brevet rank, his regimental rank is placed first—as, Captain and Brevet-lieutenant-colonel Brown, which means that an officer named Brown, who holds rank in a regiment as captain, has for his services been promoted in the army to be lieutenant-colonel. Officers of the Foot-Guards have higher rank in the army. See FOOT-GUARDS. Another class of rank is relative rank, which attaches to certain offices. Thus, Captain Brown aforesaid, in addition to regimental rank as captain, and army rank as lieutenant-colonel, may possibly hold a staff appointment which confers on him the relative rank of colonel. *Local rank* is a common expedient for advancing comparatively junior officers to important duties, a higher rank than that properly held in the army being assigned to an individual within certain geographical limits, as in the East Indies, the Crimea, &c. *Temporary rank* is similarly limited by time, and is conferred usually for the period during which some appointment is held, as the officer acting as Director of Ordnance ranks as major-general while so employed. *Honorary rank* carries neither duty nor emoluments; it is commonly given to the amount of one step to an officer who has served the time necessary for retirement; thus, a captain, after thirty years' service, may retire (on the pay of captain) with the honorary rank of major. Officers who have quitted the army are also allowed to retain as honorary the last rank they held.

Navy rank has no irregularities: it is plainly what it professes to be. The marines rank with corresponding grades in the army; and their and the army rank, as compared with the navy, will be shewn under RELATIVE RANK (q. v.).

RANK AND FILE, the body of soldiers constituting the mass of the army, and including corporals, bombardiers, and privates. Rank and file means literally the lines of men from side to side, and from front to back—a rank being a row of men standing side by side, and a file of soldiers a line of men standing one behind another. The strength of a force is reckoned by its rank and file; the non-commissioned and commissioned officers forming the supernumerary ranks charged with the direction of the mass.

RANKÉ, LEOPOLD, one of the most distinguished modern historians of Germany, was born at Wiehe in Thuringia, 21st December 1795, and educated for a schoolmaster. In 1818, he was appointed Rector of the gymnasium at Frankfurt-on-the-Oder; and in 1824 published at Berlin his first work, *Geschichte der Roman. und German. Völkerschaften von* 1494—1535. It attracted considerable notice; and in the following year he was called to Berlin as Extraordinary Professor of History at the university, where his lectures soon began to be numerously attended. About this time, his attention was directed to the historical value of the reports sent home by the Venetian ambassadors at the different European courts during the 16th and 17th centuries, and the result of his studies and investigations among these was his *Fürsten und Völker von Südeuropa im* 16 *und* 17 *Jahrh.* (Berl. 1827), in which the affairs of Turkey and Spain are specially handled. Immediately after the publication of this work, he commenced a four years' tour through Europe, for the purpose of examining the archives of the different nations. The fruit of his varied researches partly appeared in his *Serbische Revolution* (Berl. 1829), *Verschwörung gegen Venedig im J.* 1688 (Berl. 1831), and *Vorlesungen zur Geschichte der Ital. Poesie* (Berl. 1837); but a much greater and more valuable performance than any of these was *Die Röm. Päpste, ihre Kirche und ihr Staat im* 16 *und* 17 *Jahrh.* (3 vols., Berl. 1834—1836; 3d ed. Berl. 1844—1845), a work which, on account of its important conclusions regarding the character and policy of the papacy, many of which it may be said to have almost placed beyond controversy, was not only received with unbounded applause in Germany, but was translated again and again in Holland, England, France, and America, and may be regarded as one of the most widely-circulated and influential histories of modern times. It was followed up by his *Deutsche Geschichte im Zeitalter der Reformation* (6 vols. Berl. 1839—1847), considered in Germany his most finished and thorough production, and in the composition of which he was enabled to avail himself of many documents never before published or made use of. In a still higher degree than in his earlier writings, we find displayed here his skill in grouping events together in a vivid and intelligent manner, placing them before the eye of the reader in their whole significance, with all their causes, relations, and consequences. R.'s next effort may be looked upon as a continuation of his history of Protestantism. It is entitled *Neun Bücher Preuss. Geschichten* (3 vols. Berl. 1847—1848), and was worked up from the Prussian historical archives, opened to literature for the first time. The stormy period of 1848 found him in the Frankfurt parliament; but he did not acquire any distinction in that arena of babbling and incompetent patriots, and soon betook himself again to more familiar and more valuable labours. His *Franz. Geschichte vornehmlich im* 16 *und* 17 *Jahrh.*, which appeared at Stuttgart (1852—1857), is an admirable work, full of new information and enlightened views; and his *exposé* of the reign of Louis XIV. is put, even by French critics, on a level with that of Voltaire. A still later production is his *Englische Geschichte vornehmlich im* 16 *und* 17 *Jahrh.* (Berl. 1859—1862). R. has been an ordinary professor of history since 1834, and in 1841 was appointed historiographer of the Prussian kingdom. He has trained a numerous body of historical students, who have followed the spirit and method of their master.—R. has three brothers, FRIEDRICH HEINRICH RANKE (born 1797), KARL FRIEDRICH RANKE (born 1802), and ERNEST RANKE (born 1814), who have also risen to eminence as churchmen and scholars.

RANKING AND SALE is, in Scotch Law, an action whereby the land or heritable property of an insolvent person is sold, and the proceeds divided among the creditors. The main object is to sell the property in spite of the debtor, and have the proceeds distributed among the creditors, for which purpose it is necessary to arrange or rank the creditors according to their respective legal priorities. The sale takes place in the Parliament House at Edinburgh, one of the macers acting as auctioneer. If no offerers appear, the sale is adjourned, and the upset price is lowered.

RANKNESS, an excessive luxuriance of growth in vegetables, a condition as unfavourable as its extreme opposite to their health and to the productiveness of crops. It is often caused by injudicious manuring, and is most frequent in moist seasons. The decay of mushrooms in pastures, as in Fairy Rings (q. v.), sometimes produces a rankness of grass which causes all animals to refuse it; such herbage abounding to an unusual degree in Chlorophyll (q. v.), but being very deficient in those qualities which render herbage most palatable and nutritious to cattle. Rankness in grain-crops is attended with a diminished production of grain, the flowers

often proving abortive, and with a much increased liability to the attacks of parasitic fungi. In fruit trees, it displays itself, even when the soil is only a little too rich, in a tendency to the production of shoots and foliage, instead of blossoms and fruit, and is to be counteracted by withholding manure, by root-pruning, or by cutting away portions of bark. In wall-trees, deep cuts may even be made into the wood, although in standards this would involve a danger of destruction by the next storm.

RA'NNOCH, Moor and Loch. The Moor, in the north-west extremity of Perthshire, with a mean elevation of about 1000 feet above sea level, is a wild waste, 28 miles long, and 16 miles broad, and is one of the largest and most desolate and dreary moors in Scotland. Its surface is for the most part a broad, silent, and featureless tract of bog, heath, and rock, girdled by distant and gloomy mountains. In its western part is Loch Ly-loch, which winds amid flat and dismal scenery. Stretching eastward from the Moor is Loch R., about 9 miles long by from 1 to 2 miles broad. It is surrounded by mountains, contains two islands, and is drained of its surplus waters by the Tummel, a tributary of the Tay.

RA'NSOM—corrupted from the Latin *redemptio* —is the price paid by a prisoner-of-war, or paid on his behalf, in consideration of his being granted liberty to return to his own country. In early times, when armies received little or no regular pay, the soldier looked for his reward in the booty he might capture, and this booty included the bodies as well as the chattels of the vanquished. The conqueror had the option of slaying his prisoner; but for his profit, he would make him his slave, or sell him into slavery. The transition would be natural to accepting compensation from the prisoner himself, and setting him at liberty. In feudal warfare, the ransoms formed a large portion of a soldier's gains; those for persons of low degree belonging to the individual captors; but those for princes or great nobles, to the king. Ransoms were sometimes of large amount, more than the immediate family of the captive could pay. His retainers were then required by feudal usage to contribute; as in the case of redeeming King Richard I. for £100,000, when twenty shillings was assessed on every knight's fee, and the clergy subscribed liberally. David Bruce of Scotland was ransomed for 100,000 marks, and King John of France for £500,000, payable in instalments.—In modern warfare, where the fighting is performed by professional soldiers, pecuniary ransoms are scarcely ever resorted to, freedom being granted to prisoners in exchange for others of corresponding rank captured on the opposite side.

RA'NULA is the term applied to an encysted tumour, containing a glairy fluid, and lying under the tongue. The ordinary method of treating such tumours is by free incision, or by cutting out a piece of the sac; and if this is not sufficient to effect a cure, the interior should be touched with nitrate of silver, or a small seton should be passed through it, with the view of destroying it by suppuration. The name of the tumour is due to the supposed frog-like form which the swelling assumes.

RANUNCULA'CEÆ, a natural order of exogenous plants, mostly herbaceous, rarely shrubs, and generally natives of cold damp climates. Some are found within the tropics, but almost exclusively in very elevated situations. The number of known species is about 1000. They occur in all quarters of the globe, but most abundantly in Europe. The leaves are generally much divided, and have dilated sheathing stalks. The calyx is of 3–6 deciduous hypogynous sepals, the corolla of 3–15 hypogynous petals, in one or more rows, sometimes assuming very remarkable forms, as in larkspur, aconite, and columbine, rarely absent, in which case the sepals are gaily coloured. The stamens are usually numerous; the carpels are numerous, one-celled, sometimes united into a single many-celled pistil, the ovary with one or more ovules. The fruit either consists of dry achenia, or is berry-like or follicular. Acridity is the prevailing character of the order, and the leaves of many species readily produce blisters, but this property disappears when they are dried or heated. Many are narcotic and poisonous; some are used in medicine as tonics and hellebore. The seeds of *Nigella sativa* were formerly used instead of pepper. The fruit of the May Apple or Wild Lemon (*Podophyllum peltatum*) of North America may be eaten, but is highly acid.—Many of the order produce flowers of great beauty, as some species of *Ranunculus* (q. v.), *Aconite* (q. v.), *Larkspur* (q. v.), *Peony* (q. v.), *Columbine* (q. v.), *Clematis* (q. v.), &c.

RANU'NCULUS, a genus of plants of the natural order *Ranunculaceæ*; having five sepals, five petals, with a nectariferous pore at the base of each petal, often covered with a scale, many stamens situated on a receptacle, and gemmes

Garden Ranunculus.
(From a coloured engraving.)

accumulated into a head. The species are numerous, herbaceous plants, mostly perennial. Some of them adorn meadows with their yellow flowers familiarly known as *Buttercups*; others, known by the name of *Crowfoot*, are troublesome weeds in gardens and pastures. Many, as the Spearworts, are found chiefly in moist places, and some are altogether aquatic, covering the surface of ditches, ponds, and rivers, where the water is shallow, with a carpet of verdure exquisitely studded with beautiful white flowers.—One species, the Asiatic R., or Garden R., exclusively the R. of florists, a native of the Levant, has been cultivated in Europe for almost 300 years. From clusters of small tubers it sends up several basal leaves, and an erect branched stem, with terminal flowers, which, in the cultivated varieties, are often double or semi-double, yellow, white, red of various shades, or of mixed colours, very brilliant, and from an inch and a half to two inches and a half in diameter. The cultivated varieties are extremely numerous. The R. is propagated by seed, by offset tubers, or by dividing the clusters of tubers. The roots are often taken

up in summer, after the leaves die, and kept in a dry place till the beginning of the ensuing winter or spring. Protection by frames and glasses, shading from strong sunshine, and other such means, are employed in order to increase the beauty of the flowers. The R. loves a free and rich soil.—Double-flowered varieties of some other species, with taller stems and smaller white or yellow flowers, are cultivated in flower-gardens, sometimes under the name of *Bachelors' Buttons*.—The acridity of many species of R. is such that the leaves, bruised and applied to the skin, produce blisters; and those of *R. sceleratus*, a pretty common British species, are said to be used by beggars to cause sores, in order to move compassion. *R. thora*, a Swiss species, is of extreme acridity, and hunters were accustomed, in former times, to poison darts and arrows with its juice. Water distilled from the leaves of *R. flammula*, a British species, with rather tall stem and ovato-lanceolate leaves, common by the sides of ditches, &c., is an active and powerful emetic, producing almost immediate vomiting, and capable of being used with great advantage in cases of poisoning.—Yet the leaves of *R. ficaria*—sometimes called *Pile-wort* and *Lesser Celandine*, a very common British species, adorning hedge-banks with bright yellow flowers in spring—are capable of being used as a pot-herb. Pastures in which *R. acris*, *R. repens*, &c., are very abundant, are injured by them, and they ought to be diligently grubbed out; they are particularly supposed to give an unpleasant taste to milk and butter; but it is thought not improbable that a moderate mixture of these plants with the other herbage, is even advantageous, and that they may act as a condiment. Their acridity is lost in drying, and they are not injurious to hay. There are numerous species of R. in the United States, some of which are of European origin. Those more common are—*R. abortivus*, *Pennsylvanicus*, *bulbosus*, *acris muricatus*, *parviflorus*, &c.

RANZ DES VACHES (in German, *Kuhreigen*), a name applied to certain simple native melodies of the Swiss Alps, which are usually sung by the herdsmen, and played by them when driving their herds to and from the pasture, on an instrument called the *Alphorn*, consisting of a wooden tube somewhat bent, about three feet long, widened out into a bell, and bound by a pitched cord. The associations of pastoral life recalled by these airs to the Swiss in foreign countries, have been said to produce that unaccountable longing for home, or *nostalgia*, which has been remarked among the Swiss soldiers abroad. The bands of the Swiss regiments in foreign service have, on this account, been prohibited from playing the Ranz des Vaches. The Emmenthal, Entlebuch, the Bernese Oberland, the Grisons, Appenzell, and other pastoral districts of Switzerland, have each their respective Ranz des Vaches. A collection of Ranz des Vaches, along with other Swiss melodies (*Sammlung von Schweizer Kuhreigen und Volksliedern*), was published at Bern in 1818; and these airs are also to be found in the *Allgemeine Schweizer Liederbuch*, 1851. The Ranz des Vaches of Switzerland are ruder in their character than the mountain melodies of the Tyrol, with which they are sometimes confounded.

RAPA'LLO, a maritime town of Northern Italy, province of Genoa, and 17 miles east of the city of that name, with 10,422 inhabitants. It was first called Tigulia. Its only object of interest is the Sanctuary of the Madonna, on the Monte Allegro, erected in 1557. R. is a thriving commercial town, and has manufactures of wax and of soap, and of laces in thread and in cotton; it has fisheries of coral and tunny.

RAPE, or COLESEED (*Brassica napus*; see BRASSICA), a biennial plant much cultivated both on account of its herbage and its oil-producing seeds. It is a native of Europe, and perhaps of England; but it is hard to say where it is truly indigenous and where naturalised. It is so nearly allied to *Brassica rapa* (Turnip), *B. campestris* (Swedish Turnip, Colza, &c.), *B. oleracea* (Kale, Cabbage, &c.), and *B. præcox* (Summer Rape), that botanical distinction is difficult, particularly as to some of the cultivated varieties. Dr Lindley gives the following synoptical view of the most characteristic differences of these species, in Morton's *Cyclopædia of Agriculture*:

Leaves bright green, . . .	*B. rapa.*
Leaves glaucous—	
Leaves hispid when young, .	*B. campestris.*
Leaves never hispid—	
Siliques spreading, . .	*B napus.*
Siliques erect—	
Calyx erect, . . .	*B. oleracea.*
Calyx spreading, . .	*B præcox.*

The root of R. is slender, or in cultivation sometimes becomes carrot-shaped (see NAVEW), but it never becomes turnip-shaped. The stem is taller than that of the turnip, or Swedish turnip, and the foliage more luxuriant. The cultivation of R. is very general in many parts of the continent of Europe, from which it seems to have been introduced into England at least as early as the 16th c.; and in the 17th c., if not sooner, large quantities of oil were made from its seeds, chiefly in the fenny and other alluvial districts of the east of England, where also it has long been most extensively employed for feeding sheep. On the continent, it is not unusual to sow R. in order to *green-manuring*, ploughing its herbage into the soil, a mode of enriching land much more common in some parts of Europe than it is in Britain. R. delights in a rich alluvial soil, and is particularly suitable for newly reclaimed bogs and fens, in which the turnip does not succeed well; but it is also extensively cultivated in the chalk and oolite districts of the south

Rape (*Brassica napus*).

of England. The mode of cultivation does not differ much from that of turnip, and similar manures are used. In rich soils, R. sometimes attains a height of three or even four feet, so that the sheep turned in are hidden beneath the leaves, and seem to eat their way into the field. They eat the stalks even more greedily than the leaves. A too exclusive feeding on R. is, however, apt to produce diseases, which a sprinkling of salt, a supply of hay, &c., are found useful in preventing. When R. is cultivated

for seed, it is sown in autumn. When the seed is ripe, R. is cut with the sickle; and after a short time allowed for drying, the seed is thrashed out, when the haulm is often burned, a wasteful practice, as its decay affords more abundant and useful manure, and indeed cattle are fond of it as food. *Rape-cake*, the mass of seeds from which oil has been obtained by crushing, is used for feeding oxen and sheep, but is very inferior to linseed cake, and some other kinds of oil-cake. Ground into dust, it is a very valuable manure. *Rape-oil* is extensively used for machinery and for lamps; but the oil and cake so called are not exclusively obtained from this plant, nor are the names *Colza-oil* and *Rape-oil* used to discriminate the produce of different plants, although in some parts of Europe the name Colza is given to varieties of *Brassica campestris* and *B. oleracea*, which are cultivated in the same way as rape. *B. præcox* is also cultivated in some places, being sown in spring, and reaped in autumn. The seeds of other cruciferous plants are also crushed indiscriminately with these, and the oil and cake sold by the same names. See OILS.—The name *Rape* is from the same root as Ger. *reps*, and Lat. *rapa* (a turnip); *Cole-seed* and *Colza* from the same as *kale*.

RAPE is the crime of having carnal knowledge of a woman against her consent and by force. The essence of the offence is that force be used, and it is immaterial what is the age of the woman, and whether she is married or single, chaste or unchaste. The only difference caused by the habitual unchastity of the woman is that in such a case it is less easy to satisfy the jury that the element of consent was wanting. The two elements of rape are the carnal knowledge and the force used. As to the element of resistance on the part of the woman, or force on the part of the man, several niceties often occur in the application of the law, from the great variety of circumstances attending this crime. With regard to an idiot woman, it has been held that it is not necessary to prove resistance on her part, and that the crime may be committed though she made no resistance. If consent be extorted by fear and threats, or where several men join together, and resistance is useless, this is the same as using violence to overpower the woman. Where the woman is stupified by drink, so that the power of resistance is annihilated, it is the same as knocking her down. In a case, however, where force is used in the first instance, but the woman afterwards in some degree consents, the crime of rape will not be committed, though the evidence may establish the crime of assault. Some difficult cases have occurred with reference to married women who have been beguiled by men personating their husbands, and so been, in a certain sense, cheated out of their consent. But it has been repeatedly decided by a majority of the court, both in England and Scotland, that such an offence was not rape.

One of the important circumstances attending the crime of rape is the mode of proof, and in this respect it differs from other crimes. It is held to be all but essential, as a corroboration of the woman's story, that if her cries of resistance were not heard, at all events she should have, immediately after the offence, complained on the first opportunity to her friends or relations. It is not allowed to give in evidence the particulars of such complaint, but merely the fact that she made a complaint against some person. Unless this important particular be proved, her evidence is looked upon with great suspicion, and may be discredited by the jury, unless there were peculiar circumstances to account for the want of such complaint. One of the common defences to a charge of rape is the unchastity of the woman, the object being to render it unlikely that she did not consent, and hence it is in practice considered a proper question for the prisoner's counsel to put to her, whether she had not had connection with the prisoner before or with other men; but at the same time she is cautioned by the judge that she is not bound to answer such questions unless she likes. If, however, she denies the accusation, witnesses may be called to contradict her on that point.

The crime of rape is felony by the law of England, and is punishable by penal servitude for life, or for not less than three years, or by imprisonment not exceeding two years, with or without hard labour. Of late, attempts have been made to add flogging or corporal punishment to the other punishments, but bills having that object have been thrown out of parliament. There are several other crimes in the same category as rape, but punishable under separate enactments. Thus, the crime of having carnal connection with a girl under the age of ten years is felony, and punishable like rape. Whoever has carnal connection with a girl who is between the age of ten and twelve years, is guilty of a misdemeanour, and liable to penal servitude for three years, or imprisonment for two years with hard labour. Consent of the girl in these two cases is immaterial. The forcible abduction of women is divided into two offences. Wherever a woman of any age has property, and is forcibly taken away with intent to marry or carnally know her, the offence is felony, punishable by penal servitude of three to fourteen years, or two years' imprisonment. Again, if a girl, though having no property, is under the age of twenty-one, and is fraudulently allured or taken away out of the possession of her parents or guardians, with intent to marry or carnally know her, this is felony, punishable as in the preceding case. In order to the commission of the latter offence, an improper motive is necessary on the part of the man, but the consent of the girl is of no consequence.

RAPHAEL, or RAFFAELLO SANTI or SANZIO, called by his countrymen *Il Divino*, 'the Divine,' is ranked by almost universal opinion as the greatest of painters. He was born at Urbino in 1483, and in 1497, on the death of his father, Giovanni Santi, who was his first instructor, he was placed under Pietro Perugino, the most distinguished painter of the period, who was then engaged on important works in the city of Perugia. In 1504, R. visited Florence, and improved his style by studying composition and expression in the works of Masaccio, and colour and effect in those of Fra Bartolomeo. He seems to have lived in Florence till 1508, when he went to Rome, on the invitation of Pope Julius II. His celebrated frescoes in the Vatican and numerous important works were then commenced. Julius died in 1513; but his successor, Leo X., continued R.'s services, and kept his great powers constantly in exercise. The works of R. are generally divided into three classes: his first style, when under the influence of Perugino's manner; his second, when he painted in Florence from 1504 to 1508; and his third style, which is distinguishable in the works executed by him after he settled in Rome. Each of these styles has its devoted admirers. Those who incline to art employed in the service of religion, prefer the first manner, as embodying purity and religious feeling. His last manner, perfected when the taste for classical learning and art was strongly excited by the discovery of numerous valuable works of the classic period, is held by many connoisseurs as correctly embodying the highest art; while his middle or Florentine style is admired by

some as exemplifying his powers, freed from what they deem the rigid manner of Perugino, and untainted by the conventionalism of classic art. In all these different styles, he has left works of great excellence. 'The Coronation of the Virgin,' in the gallery of the Vatican, and 'The Spozalizio,' or Marriage of the Virgin, in the Brera Gallery at Milan, belong to the first period. The 'St Catharine,' in the National Gallery, London; 'The Entombment,' in the Borghese Gallery, Rome; 'La Belle Jardinière,' in the Louvre, to his second period. While the 'St Cecilia,' at Bologna; the 'Madonna di San Sisto,' at Dresden; 'The Cartoons,' at Hampton Court; 'The Transfiguration;' and all the Vatican frescoes, except 'Theology, or the Dispute on the Sacrament,' the first he executed on his arrival from Florence, are in his third manner, or that which peculiarly marks the Roman school in its highest development. R. died at Rome on April 6, 1520, the anniversary of his birthday.

RAPHA'NIA, or ERGOTISM, is a disease which was much more prevalent some centuries ago than it is at present. It is defined as 'a train of morbid symptoms, produced by the slow and cumulative action of a specific poison peculiar to wheat and rye, and which gives rise to convulsions, gangrene of the extremities, and death' (Aitken's *Science and Practice of Medicine*, 1858, p. 332). It has been described under various names. From the 10th to the 14th c., it was known as *St Anthony's Fire*, a title which has been since associated with erysipelas. It was then described as epidemic gangrene. The name *Raphania* was first given to it by Linné, who thought the morbid symptoms were dependent upon the mixture of *Raphanus Raphanistrum*, or jointed charlock, with the wheat used as food. It was suspected, as early as the end of the 16th c., that the disease was due to the development of a fungus on the grain, and this fact is now established beyond doubt, although some writers hold (like Linné) that this morbid state is also produced by the admixture of poisonous plants, especially *Lolium temulentum*, or darnel, being mingled with the grain. Although rye is the ordinary seat of the poisonous fungus, wheat, rice, and other grains are liable to be similarly affected, and to produce similar results. For an account of the fungus, see ERGOT.

There are two forms of the disease—the spasmodic and the gangrenous. The spasmodic form begins with tingling or itching of the feet and hands, and sometimes of the head. Violent contractions of the hands and feet, giving rise to intense pain in the joints, are a common symptom. The head is much affected, the patient complaining of drowsiness, giddiness, and indistinct vision. If coma or epileptic convulsions supervene, there is little hope of recovery. The appetite is usually enormous; spots like those of purpura appear on the face, and there are seldom any signs of improvement for some weeks. The gangrenous form begins with extreme lassitude, and is accompanied by some febrile disturbance. The extremities are painful, cold, almost insensible, and not readily moved; and after a varying time, gangrene supervenes.

With regard to treatment, the first thing to do is to replace the poisonous flour by easily digested, nourishing, wholesome food. The pain must be relieved by opiates, the blood purified by the administration of chlorate of potash, and the general tone of the system improved by tonics, such as the preparations of iron, bark, &c. In the spasmodic form, warm baths and gentle friction would probably prove serviceable. Whatever be the form of treatment adopted, the mortality in the gangrenous form is usually 90 per cent. The spasmodic form is much less destructive to life.

RA'PHIDÉS are crystals found in the interior of the cells of plants. The word is the plural of the Greek *raphis*, a needle, and was originally used to denominate crystals of an acicular form, which are often collected together in bundles. But crystals of various forms are found in the cells of plants, consisting chiefly of phosphate or of oxalate of lime. In many kinds of plants, they very much abound, and often in a particular manner in particular parts of plants. They are very minute, and are found in such delicate tissues as the petals of the Pelargonium.

RA'PIDAN. See RAPPAHANNOCK.

RA'PIER is said to have had distinct meanings at different times, and in ancient fencing to have been a long cutting broadsword; but for the last century at least, the rapier has been a light, highly-tempered, edgeless, thrusting weapon, finely pointed, and about 3 feet in length. It was for long the favourite weapon in duelling, and was worn by every gentleman. At present, it is worn only on occasions of court ceremonial, and answers no other purpose than to incommode the wearer. In war, a rapier could never have been of any service.

RAPIN DE THOYRAS, PAUL DE, a French historian of England, was descended from a Protestant Savoyard family, which settled in France in the 16th c., and was born at Castres, in Languedoc, March 25, 1661. He studied at the Protestant college of Saumur, and passed as advocate in 1679, but had no liking for the profession; and when the Edict of Nantes (1685) forced him to leave France, he sought employment first in England (where he was unsuccessful), and afterwards in Holland, where he enlisted in a corps of volunteers at Utrecht, formed by his cousin-german, Daniel de Rapin. With his company, he followed the Prince of Orange to England in 1688, was made ensign in the following year, and distinguished himself by his bravery at the siege of Carrickfergus, the battle of the Boyne, and the siege of Limerick, where he was shot through the shoulder by a musket-ball. In 1693, he was appointed tutor to the Earl of Portland's son, with whom he travelled in Holland, Germany, and Italy, after which he took up his residence at the Hague; but in 1707, withdrew with his family to Wesel, in the duchy of Cleves, where he devoted the remaining 17 years of his life to the composition of his great work. The severity of his labours is believed to have shortened his days. He died May 16, 1725. R.'s *Histoire d'Angleterre* was published at the Hague in 8 vols., the year before his death. It was undoubtedly, as Voltaire has said, the best work on English history that had until then appeared: full, minute, careful in citing authorities, clear, rapid and accurate in narration, methodical in the arrangement of its materials, comparatively impartial in spirit, and yet betraying on the part of the author an honourable reverence for law and liberty. R. begins with the invasion of Britain by the Romans, and ends with the death of Charles I. The work was continued to the death of William III. by David Durant (Hague, 2 vols., 1734). The best edition of the *Histoire* in its augmented form is by Lefebvre de Saint-Marc (Hague, 16 vols., 1749 *et seq.*). The original was translated into English by the Rev. Nicholas Tindal, M.A. (Lond. 15 vols., 1725—1731), and subsequently by John Kelly, barrister (in 2 vols. fol.).

RAPP, JEAN, Count, a French general, was born at Colmar, in the department of Haut-Rhin, France, 27th April 1773. He was intended for the church, but his taste for a military life led him to enrol himself (1788) in the mounted 'chasseurs' of the French

army. R. distinguished himself by dashing gallantry in Germany and Egypt, and on the death of Desaix at Marengo, he became aide-de-camp to Napoleon. His brilliant charge at Austerlitz upon the Russian Imperial Guard, which put the latter to a complete rout, was rewarded with the grade of general of division (24th December 1805). But R. joined to the utmost bravery and coolness, a quick and unerring judgment, which enabled him not only fully to comprehend Napoleon's plans, and execute to the spirit the duties intrusted to him, but also at times to amend and even disobey his orders with the happiest results. The latter was the case at Lobau, where R.'s disobedience decided the battle in favour of Napoleon; and for this service, he was named a Count of the Empire (1st August 1809). He opposed the Russian expedition with the utmost earnestness, but, notwithstanding, accompanied the Emperor throughout the whole of it, adding on many occasions to his own reputation and the glory of the French arms. His obstinate defence of Danzig for nearly a year against a powerful Russian army, placed him in a high position among military men; and his chivalrous and considerate treatment of the unfortunate inhabitants during the siege was so warmly appreciated by them, that they presented him with a magnificent sword enriched with diamonds. The Russians, contrary to the articles of capitulation, sent R. and his garrison prisoners to Russia, and he did not return to France till July 1814. On reaching Paris, he was well received by Louis XVIII.; and in March 1815 was one of those appointed to oppose the return of Napoleon, but deserted, along with his troops, to his old master, and was appointed commander-in-chief of the army of the Rhine (16th April), and peer of France (2d June). After Waterloo, R. again submitted to Louis, but retired to Switzerland for two years, returning in 1817, and receiving a full pardon in the following year. He was re-created a peer of France (5th March 1819), and held various offices about the court; but broken in health by constant hard service and numerous severe wounds, he died at Paris, 8th November 1821. A volume of Memoirs (1823, in 8vo) has been published under his name.

RAPPAHA'NNOCK, a river of Virginia, formed by the union of the North Fork and the Rapidan, which rise in the Blue Ridge of the Alleghany Mountains, and flow eastwardly to their point of union, 40 miles above Fredericksburg, where the falls afford water-power. The river is navigable from this point south-east to Chesapeake Bay, which it enters by a broad estuary, 70 miles long. On the Rappahannock and the Rapidan occurred some of the most sanguinary battles of the War of Secession, at Fredericksburg, Chancellorsville, and the Wilderness.

RAPPAREE', a wild Irish plunderer, so called from his being generally armed with a *rapary*, or half-pike. The term was in common use in the 17th century. See *Notes and Queries*, August 17, 1861.

RAPPEE', a coarse-grained species of SNUFF (q. v.). The word is of French derivation, and arose from this species of snuff being manufactured from dried tobacco by means of the *râpe* or *raspe*, an instrument by which the thin parts of the leaf were cut from the veins and fibres, the latter alone being used in the manufacture of rappee.

RA'PPEN, a small Swiss coin, made of an alloy of copper and tin, forming the one-hundredth part of the modern Franc (q. v.), and therefore equivalent to the French centime. The old Swiss franc (= about 1*s.* 2*d.* sterling) was also divided into 100 rappen. The rappen was first coined at Freiburg, and took its name from the head of a raven (Ger. *rabe*, pronounced in some parts *rap*) impressed upon it.

RAPTO'RÉS. See ACCIPITRES.

RARATO'NGA. See COOK ISLANDS.

RAS (= Heb. *rosh*), an Arabic word, signifying 'head,' 'promontory,' occurs in the names of many capes on the Arabian and North African coasts, and also in Sicily and Malta; as Rasigelbi (corrupted from Rasi-calbo) 'the dog's cape,' on the north coast of Sicily; Ras-el-Abyad, 'white cape,' on the coast of Palestine; Ras Bab-el-Mandeb, 'cape of the gate of tears,' at the Strait of Bab-el-Mandeb; Ras-el-Jezirah, 'cape of the peninsula;' Ras-el-Had, the eastern point of Arabia.

RASHES, affections of the skin, characterised by a red superficial efflorescence, diffused or in patches, disappearing under pressure, and usually ending in desquamation. To this division of cutaneous disorders belong Rubeola (or Measles), Scarlatina (or Scarlet Fever), Erysipelas (or St Anthony's Fire), Erythema, Roseola (or Scarlet Rash), and Urticaria (or Nettle Rash). Of these rashes, Rubeola, Scarlatina, and Erysipelas are rather to be regarded as fevers or blood diseases, than as cutaneous diseases, in the true sense of the phrase.

RASHI (i. e., Rabbi Solomon [Shelomo] Izaaki, or Ben Izaak, often erroneously called Jarchi), the greatest Jewish commentator and exegete, was born about 1040, in Troyes, in France. The range of his studies was as extraordinarily wide as were his early developed faculties brilliant, and his industry and perseverance enormous. Philology, philosophy, medicine, astronomy, civil and canonical law, exegesis, were the chief branches of his learning; and to a rare proficiency in them, he united a complete mastery over the whole range of Scripture and the Talmudical sources. In order further to perfect himself for his gigantic task, he travelled for seven years, visiting the academies of Italy, Greece, Germany, Palestine, Egypt, where he sat at the feet of the great masters of the age, collecting their sayings and legal decisions. His chief work—and one universally recognised as the principal work of all Scriptural exegesis—is his Commentary to the whole of the Old Testament. Up to this day, it has not been superseded by any other, although in the province of philology and antiquities, investigation has been much furthered since his time. R.'s style is extremely brief and concise, yet clear and pregnant; obscure and abstruse (as it has been pronounced by some) only to those who lack the necessary preliminary knowledge. According to the fashion of its day, it is replete with allegorical or rather poetical illustrations, gathered from the wide fields of the Midrash within and without the Talmud; and many a passage is thus preserved to us, which, in the disordered state of those manuscripts, would probably otherwise have been lost. This Commentary—entirely translated into Latin by Breithaupt, and partly also into German—was the first book ever printed in Hebrew (Reggio, 1474), and has since been reprinted with almost every complete edition of the Hebrew Bible. Of his numerous other works is first to be mentioned his Commentary to 23 treatises of the Talmud, supplemented after his death by his grandson, Samuel ben Meier; further, a Commentary to the Pirke Aboth; the *Pardes*, treating of Laws and Ceremonies; a Collection of Legal Votes and Decisions;

a Commentary to Midrash Rabbah; a Book of Medicine; a poem on the Unity of God, &c., &c. He died about 1105; and such were his piety and his surpassing eminence, that later generations wove a shining garland of legends around his head. The confusion of R. with two Jarchis, who lived long after him, has not hitherto been properly accounted for. They bore that surname because they were born at Lunel, Jerach being the Hebrew for moon, *Lune* in French.

RASK, Rasmus Christian, a distinguished Danish philologist, was born at Brendekilde, near Odense, in the island of Fünen, 22d November 1787, studied at Copenhagen, and in 1808 published his first work, *Vejledning til det Islandske eller gamle nordiske Sprog* (Rules of the Icelandic Language or the Ancient Language of the North). During the years 1807—1812, he occupied himself with drawing up grammatical systems for most of the Germanic, Slavic, and Romanic tongues, and in comparing them with those of India. He then visited Sweden, where he commenced to study Finnish; and in 1813 proceeded to Iceland, where he lived for two or three years, perfecting his knowledge of the language, the history, and the sagas of the inhabitants. On his return to Copenhagen, he was appointed sub-librarian to the university; and in 1818 published a splendid work, *Undersaegelse om det gamle nordiske eller Islandske Sprogs Oprindelse* (Researches concerning the Origin of the Icelandic or Ancient Language of the North), which led Grimm to his famous discovery of the displacement of consonants in the Teutonic languages. Previous to this, however, he had resolved to visit Asia; and after spending a year (1817) in Stockholm, where he published his admirable *Angelsaksik Sproglaere* (Anglo-Saxon Grammar), and the first critical and complete edition of the two great monuments of Scandinavian mythology, the *Snorra Edda* and the *Edda Saemundar*, he went to St Petersburg, where he devoted himself for two years, with intense eagerness, to the study of the oriental languages, principally Sanscrit, Persian, and Arabic, but not failing to acquire, at the same time, a competent knowledge of Russian and Finnish. Thus equipped, he proceeded to Astrakhan, where he stayed six weeks, to study the language of the Tartars, and then commenced a journey through the country of the Turkomans, the Caucasus, Persia (where he added the Mongol and Mantchu dialects to his already enormous linguistic acquisitions), Hindustan (cultivating in the last-mentioned country the society of learned Brahmans, and visiting all their great schools), and finally Ceylon, where he made himself acquainted with Cingalese and Pali, and wrote his *Singalesisk Skriftlaere* (Colombo 1822). In 1823, R. returned to Copenhagen, laden with learning and rare manuscript treasures, of which the greatest part was presented to the university. In 1825, he was appointed Professor of 'Literary History,' and in 1828, of Oriental Languages. Next year, he was made chief custodier of the university library; and in 1831, Professor of Icelandic. But his immense labours had exhausted his energies, and he died 14th November 1832, at the early age of 45, a victim of hard work. Besides the productions already mentioned, R. wrote *Frisisk Sprog'aere* (Cop. 1825); *Den gamle Aegyptiske Tidsregning* (The Ancient Egyptian Chronology, 1827); *Den aeldeste Hebraiske Tidsregning* (The Oldest Hebrew Chronology, 1828); besides grammars of several languages, and a great number of miscellaneous articles in the learned journals of the North, which were collected after his death, and published (Co). 3 vols. 1834—1838), together with a life by Petersen.

RASKO'LNIK (Russ. *separatist*), the name of a variety of sects in the Russian Church, which date from an early period, and must be regarded rather as a general designation of dissenters from the established church of Russia, than as a description of any specific form of doctrinal belief. Such dissent is traceable from the very earliest period of the distinct organisation of the Russian Church. A monk, named Andrew, in 1003; another, called Demitry (Demetrius), in the 12th c.; an Armenian monk, named Martin, who was burned as a heretic at Constantinople in the end of the same century; Leo, Bishop of Rostow in the beginning of the 14th, and Strigolnik and Nikita towards its close —are all mentioned as having originated or propagated heresies of various kinds. A still more remarkable and more formidable organisation—a form of Crypto-Judaism—was introduced in the 15th c. by a concealed Jew, called Zacharias, who succeeded in gaining many followers. One of these, called Zosima, is particularly noticeable, as having obtained much popularity, and even managed to have himself elected metropolitan of Moscow. His sect, which studiously concealed itself wherever this concealment seemed necessary, was condemned by a synod (1490), and repressed with great rigour; but it continued to maintain a concealed and precarious footing, and is said to possess disciples even to this day, especially in the government of Irkutsk, under the name of Selesnewschschina. A sect, whose leading principles were borrowed from the German reformers, was founded in 1553 by Matthias Baschkin; but it was condemned at a synod in Moscow, and does not appear to have taken much hold on the people.

But it is from the middle of the 17th c. that—the separation of the sects from the national church having become more tangible, from its involving nonconformity with the established worship—the designation of R. finds its fullest application. At that period, a complete revision of the ancient Slavonic liturgical and ritual books, which had suffered grievously from the ignorance, and probably also from the heterodoxy of transcribers, was undertaken by the Patriarch Nikon. See Philippins. The revised books were introduced into the churches by the authority of the czar as well as of the patriarch; but many of the clergy and people resisted the innovation, and refused the new liturgies. Foremost among the recusants, or nonconformists, were those who had already been sectaries upon other grounds; but all differences were to some extent merged in this common ground of protest, and all were known under the common appellative Raskolniks.

In later Russian history, the Raskolniks are sometimes called by the name, which they themselves affect, of Starowierzi ('Men of the Old Faith'), or Prawaslawnüje ('orthodox'). Each sect has its specific doctrinal peculiarities; but most of them follow certain common observances, in which lies their tangible difference from the national church. They cross themselves with the first and middle finger, and not with the first three fingers; they use only the unrevised service-books; they repeat Halleluiah only twice; in church ceremonies, they turn from left to right, and not from right to left; they use seven and not five altar-breads in the Eucharistic offering; they pay worship only to ancient pictures, or those painted by themselves; they use an eight-pointed instead of the ordinary cross; they attend only their own churches, and hold no communion of worship with the members of the national church; they never shave or cut their hair, and adhere strictly to the old Russian costume.

They may be divided, in general, into two classes —those which have popes (priests), and those who do not recognise the priestly order. The former are in every respect more moderate and more free from fanaticism than the Raskolniks who discard the ministry of priests. Their priests, however, have often been outcasts of the orthodox church, who betook themselves to the rival communion. The most notable among the Raskolniks of this class are those called the Peremasanowschtina, who re-ordain all popes joining their communion; the Jewlewschtschina, who are said to permit freedom of divorce and exchange of wives; Dositheowschtschina, so called from their founder, a monk named Dositheus; and Tschernobolzi, whose chief distinction consists in refusing to take an oath, and to say the prayer for the emperor prescribed in the liturgy. Of the non-popish Raskolniks, the chief are the Philippins (q. v.), the Pomoræanians or Rebaptisers, the Theodosians—an offshoot of the Pomoræanians—and a sect of mystic spiritualists with strong Protestant and rationalistic leanings, called Duchoborzen. A curious development of the R. movement is found in the Samokrischtchina (Self-baptisers) and the Samostrigolschtschina (Self-ordainers), among whom each one administers baptism to himself, each priest ordains himself, and each monk or nun performs the ceremony of his own consecration without the interposition of the regular ministry. It may be added, in conclusion, that with a considerable proportion of these various sectaries, there is found largely mixed up with religious fanaticism an element of communism and of disaffection towards the reigning dynasty, or, more properly, towards the established order of things. The latter may be in part explained by the rigorous measures of repression under which the Raskolniks have suffered for many successive generations. The former is an ordinary accompaniment of the sectarianism of the poor, especially those of the peasant class, and still more of the serf population.

RA'SPBERRY (*Rubus Idæus*), the most valued of all the species of Rubus (q. v.). It has pinnate leaves, with 5 or 3 leaflets, which are white and

Wild Rasp.

very downy beneath, stems nearly erect, downy, and covered with very numerous small weak prickles; drooping flowers, and erect whitish petals as long as the calyx. The wild R. has scarlet fruit, and is found in thickets and woods throughout the whole of Europe and the north of Asia. It is common in Britain. The R. has long been in cultivation for its fruit. There are many cultivated varieties, with red, yellow, and white fruit, much exceeding the wild kind in size. The stem in a wild state is 3—4 feet high; in cultivation, 6—8 feet or upwards. Some of the cultivated varieties are also more branching than is common in a wild state, the stem of the wild plant being simple or nearly so. The root is creeping, perennial; the stems only biennial, bearing fruit in the second year, woody, but with very large pith. Plantations of raspberries are most easily made by means of suckers. The R. loves a light rich soil, and is rather partial to a shady situation. The tall kinds are unsuitable in situations much exposed to winds, as the stems are easily broken. The rows are generally about 4 feet apart, the plants 3 to 4 feet apart in the rows. The young stems are thinned out to allow free access of air to those which are left. Stakes are often used to support the stems, or they are variously tied together. The fruit is used for dessert; for jams, jellies, &c.; for making or flavouring many kinds of sweetmeats; and mixed with brandy, wine, or vinegar, for the preparation of *R. Syrup*, *R. Vinegar*, &c. Different preparations of it are used in medicine in cases of fever, inflammation, &c. R. vinegar is a particularly grateful and cooling drink in fevers. Raspberries, fermented either alone or along with currants and cherries, yield a strong and very agreeable wine, from which a very powerful spirit can be made.—Several varieties of *Rubus* are known as blackberries, and are much cultivated in America. Numerous varieties have originated in the United States, but few have long retained popularity. Among the best are *Doolittle's Black-cap*, *Philadelphia*, and *Brinckle's Orange*. The *Hornet*, *Fastolf*, *Franconia*, and *Antwerp* are still held in esteem.

RASPBERRY VINEGAR, a culinary preparation, consisting of raspberry juice, vinegar, and sugar. It is best made by putting carefully gathered and very ripe raspberries into jars, and when as full as they will hold of the fruit, filling up the jars with good vinegar; after eight or ten days, pour off the vinegar, and let the fruit drain for some hours. The mixture of vinegar and juice thus obtained is added to another quantity of fruit, and treated in the same way. This is sometimes repeated a third time, and then the liquid is gently boiled for about five minutes with its own weight of refined sugar. Added to water, it forms a most refreshing summer drink, and is a useful cooling drink in sickness.

RA'STADT, a town of Baden, and, since 1840, a strong fortress of the late Germanic Confederation, stands on the river Murg, 3 miles from its junction with the Rhine, and 15 miles south-west of Karlsruhe. It is a station on the Mannheim, Basel, and Waldshut Railways. From 1725 to 1771, the town was the residence of the Markgrafs of Baden-Baden. Steel wares, weapons, and tobacco are manufactured. R. is memorable for two congresses —the former in 1714, when a treaty of peace, which brought the war of the Spanish Succession to a close, was signed between Marshal Villars and Prince Eugene; and the latter in 1799. On the breaking up of the congress of 1799 without any definite result, the three French plenipotentiaries set out for Strasbourg on the evening of April 19; but they had scarcely got beyond the gates of R., when they were attacked by a number of Austrian hussars; two of the three were slain, and the third sabred, and left for dead in a ditch. The papers of the legation were carried off, but no further spoil was taken. This flagrant violation of the law of nations roused the indignation and horror not only of France, but of all Europe. The instigator and conductor of the assault remains still unknown. Pop. 10,726.

RAT, the popular name of all the larger species of the genus *Mus*. See Mouse. Two species are particularly deserving of notice, the only species found in Britain, or, indeed, in any part of Europe, and both very widely distributed over the world: the Black Rat (*M. rattus*) and the Brown Rat (*M. decumanus*). Extremely abundant as these animals now are, their introduction into Europe—which, if at all through human agency, was unintentionally so—took place within recent times. Neither of them was known to the ancients. Both appear to be natives of the central parts of Asia, where other nearly allied species are also found. The black rat found its way to Europe about the beginning of the 16th c.; the brown rat first appeared at Astrakhan in the beginning of the 18th c., and reached Britain and the western countries of Europe about the middle of the century. The Jacobites of Britain were accustomed to delight themselves with the notion that it came with the

Black Rat (*Mus rattus*); Brown Rat (*Mus decumanus*).

House of Hanover, and chose to call it the *Hanoverian Rat*. It also received the name of *Norway Rat*, from a belief, unquestionably erroneous, that it was introduced from Norway, a country which it did not reach until long after it was fully established in Britain.

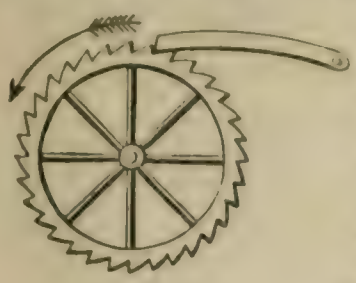
These two species are like one another, and very similar in their habits. The brown rat is the larger and more powerful of the two, and has waged war against the other with such success as to cause its total, or almost total, disappearance from many places where it was once very abundant; so that in many parts of Britain, where the black rat was once plentiful and troublesome, it would now be difficult, perhaps impossible, to obtain a single specimen. Rats, when pressed by hunger, do not scruple to devour the weaker even of their own kind. The extirpation of the black rat does not, however, always follow from the introduction of the brown rat, each probably finding situations more particularly suited to itself. In their native regions, they exist together; and in some parts of Europe the black rat is still the more plentiful of the two. Both infest ships, and are thus conveyed to the most distant parts of the world, some of them getting ashore at every port, and establishing new colonies, so that they are now common—and particularly the brown rat—almost wherever commerce extends.

The black rat is nearly seven inches and a half in length, exclusive of the tail, which is almost eight inches long. The brown rat attains a length of more than ten inches and a half, with a tail little more than eight inches long. Besides its larger size and comparative shortness of tail, it differs from the black rat in its smaller ears and less acute muzzle, as well as in its lighter colour and shorter hair. The tails of both are covered with a multitude of rings of small scales.

Both species are extremely prolific, breeding at a very early age, several times in a year, and producing from 10 to 14 at a birth. The excessive increase of their numbers, where abundant food is to be found, and there are few enemies to interfere with them, is thus easily accounted for. They sometimes multiply amazingly in ships; and perhaps nowhere more than in the sewers of towns. But in the latter situation, they really render good service to the promotion of public health, acting as scavengers, and devouring animal and vegetable substances, the putrefaction of which would otherwise be productive of pestilence. Such, indeed, seems to be the great use of the rat in the economy of nature; and it is perhaps worthy of notice, that the visits of the plague to Western Europe and to Britain have ceased from the very time when rats became plentiful. The brown rat, inhabiting sewers, is generally larger, fiercer, and of coarser appearance than the same species in houses or barns. Rats are also often found inhabiting burrows in dry banks, near rivers, &c. They feed indiscriminately on almost any kind of animal or vegetable food; they make depredations in fields of grain and pulse, from which they often carry off large quantities to be stored in their holes; they devour eggs; they kill poultry, partridges, &c.; they make most unwelcome visits to dairies and store-closets; and they multiply enormously in the vicinity of slaughter-houses and knackers' yards, which afford them great supplies of food. Their strong rodent teeth enable them to gnaw very hard substances, such as wood and ivory, either for food, or in order to make their way to more tempting viands.

They are creatures of no little intelligence. Many curious stories are told of the arts which they employ to attain desired objects, of the readiness with which they detect the approach of danger, and the skill with which they avoid it. Their sense of smell is very acute, and the professional rat-catcher is very careful that the smell of his hands shall not be perceived on the trap. They are very capable of being tamed, and have in some instances proved interesting pets.

The flesh of rats is eaten, but only by rude tribes, or when food is scarce. The skin is used for making a fine kind of glove-leather.



The name rat is often popularly given, not only to species nearly allied to these, but to other species of *Muridæ*, now ranked in different genera, some of which are noticed in other articles.

RAT, Water. See Vole.

RATAFI'A, the generic name of a series of cordials, prepared usually by mixing an alcoholic liquor with the juice of some fruit or some flavouring material, and sugar or syrup. The name is of French origin, and is said to have been given in consequence of the former habit of preparing a choice drink to be used at the ceremony of *ratifying* a treaty. A favourite flavouring for ratafias is the almond—hence, bitter almonds, cherry, peach, apricot, plum, and other similar kernels, are much used, and hence small almond-flavoured cakes are called ratafia cakes; but many other flavours are used, as orange flowers, gooseberries, raspberries, aniseed, angelica stalks; chocolate; black currants, coffee, &c.

RATCH, or RATCHET, in Machinery, is a small piece of metal, so placed with one end on a pivot, that the other can fall into the teeth of a wheel, as in the fig. Being perfectly free to move up and down, its own weight makes it drop into tooth after

tooth as the wheel revolves. But, as will be seen from the peculiar shape of the teeth, which have the form of an inclined plane on one side, and a perpendicular face on the other, the wheel can only revolve in the direction of the arrow.

Ratch.

RATE, or ASSESSMENT, is a money payment levied upon the owners or occupiers of real property, in respect of some benefit to such property, or in discharge of some legal liability attaching to it. The power of rating proprietors or tenants of lands is a power not existing by the common law of England, except for the repair of the parish church or of the parish highways; for poor rates, county rates, &c., are all authorised by some statute or statutes. A rate is in the nature of a local tax, and therefore so far contrary to the law, that clear authority must always be shewn for levying it. Hence, whenever a statute prescribes the conditions under which a rate may be imposed, it invariably states by whom the rate is to be made, and how it is to be enforced, and what appeal is to be allowed in case of an individual being aggrieved. These conditions must all be strictly complied with to the letter, otherwise the party rated can raise objections, and resist the rate. It may be said to be a general rule, that all rates must be so entitled that the parties rated are informed even by its heading whence the authority is derived. It is almost an invariable rule that the payment of rates is enforced in a summary way by justices of the peace, and this is one of the chief functions performed by justices. The mode in which this is practically done is by the party who has power to rate, or the agent or collector, applying to the justices for a summons, calling on the ratepayer to pay it. If payment is refused or neglected, application is next made for a distress-warrant to enforce payment, which means, if the payment is not made forthwith, or within a short specified time, the constable may seize the goods and chattels of the ratepayer, and sell them to make up the amount; and if there are no goods to seize, the party may be imprisoned for a specified time. As a general rule, imprisonment is only allowed after all means of recovering the rate by distress or seizure of the goods have failed. Owing to the strictness with which the machinery of rating must be carried on as directed by the statute, the ingenuity of the ratepayers, whetted by the natural indisposition of mankind to pay taxes, constantly prompts them to detect flaws in the proceedings, and litigation in various shapes is thereby produced throughout the country. As a new rate is almost invariably made every year, and sometimes every half year, constant opportunities for displaying this spirit of resistance are afforded.

RA'TEL (*Mellivora*), a genus of quadrupeds of the Bear family, *Ursidæ*, nearly allied to the Gluttons (q. v.), from which it differs in having one false molar less in each jaw, and the upper tubercular teeth slightly developed. The general aspect is similar to that of the badgers, but heavier and more clumsy. Two species are known, one of which, the CAPE R. (*M. Ratel* or *Capensis*), inhabits the south of Africa, and is said to feed much on bees and their honey, its thick fur protecting it against their stings; the other inhabits the north of India, prowls about by night, is a voracious devourer of animal food, and often scratches up recently interred bodies from their graves. The Cape R. is about the size of a badger, gray above, black below. It is

Ratel (*Mellivora Ratel*).

easily tamed, and is amusingly active in confinement, continually running about its cage, and throwing strange somersaults to attract the attention of spectators, from which it seems to derive great pleasure.

RATEL-I-COUM, a Turkish sweetmeat, which has lately become common in confectioners' shops under several names, but chiefly that of 'Lumps of Delight.' Its composition is starch and syrup, sometimes coloured. It is imported in the form of small cakes, about an inch thick and one or two inches square, and evidently cut from a mass. These pieces have been sprinkled with powdered white sugar, to prevent them from sticking together in the small boxes in which they are packed.

RA'THENAU, a small manufacturing town of Prussia, in the province of Brandenburg, on the right bank of the Havel (here crossed by a stone bridge), 45 miles west-north west of Berlin. It consists of two portions, one old, and surrounded by walls, and the other new. Weaving, spinning, and brick and tile making are carried on, and there is a large factory for making spectacles, which employs 100 workmen. Pop. 8142.

RATHKEALE, a market and post-town of the county of Limerick, Ireland, situated on the river Deel, 17 miles south-west of Limerick. It is a place of some inland commerce, but possesses no manufactures of any note. It is remarkable as a chief centre of the Palatine settlers introduced into Ireland soon after the close of the Jacobite war. Several of the families still remain in the district. The population in 1861 numbered 2761, of whom 2599 were Catholics.

RATHLIN, ISLAND OF, an island 6¼ miles in length by 1½ miles in breadth, in the barony of Carey, county of Antrim, Ireland, 6½ miles distant from the coast at Ballycastle, lat. 54° 36′ N., long. 9° 15′ W., supposed to be the Ricina of Ptolemy, and Ricnia of Pliny, and called variously by later writers Rachri, Raghlin, and Raghereu, or Rath Erin, fortress of Ireland. It has been known in history since the days of the first religious migrations of the Irish monks under Columba. It was the scene of more than one struggle in the Danish wars, and it afforded shelter, after his defeat in Scotland, to Robert Bruce. In 1558, the Scottish colony which then inhabited the island was attacked by the Lord-deputy Sussex, and expelled from the island with such slaughter, that in 1590 R. was said to be entirely uninhabited. The geological formation of R. is basalt with limestone, and on the east side the basalt takes a columnar form, similar to that of the Giants' Causeway on the Irish, and of Staffa on the Scottish shore. The soil is

light, but in the sheltered valleys productive. Formerly, a considerable industry existed on the island in the manufacture of kelp; but since the cessation of that trade (see KELP) the population, which in 1841 amounted to 1039, had at the census of 1861 been reduced to 453.

RA'TIBOR, a town of Prussia, in Upper Silesia, stands on the left bank of the Oder, 44 miles south-south-east of Oppeln. It is a walled town, and a station on the Breslau and Vienna Railway. Pop. (1867) 14,571, who are employed in the manufacture of hosiery, woollen and linen fabrics, and tobacco.

RA'TIFICA'TION is a legal term used in the law of Scotland to denote the acknowledgment made by a married woman apart from her husband, and before a justice of the peace, that a deed executed by her is voluntary, and made with full knowledge of its legal effect. In this sense, the term corresponds to what is technically called in England an acknowledgment by a married woman. With regard to minors, the term is also technically used to denote the kind of confirmation or approval given by a person arrived at majority to acts done by him during minority, and which has the effect of conclusively establishing the validity of the act, which would otherwise be voidable.

RATING OF MEN, in the Navy, signifies the grade in which the man is entered on the ship's books; as, rated a petty officer, rated an able seaman, &c.

RATINGS of ships are divisions made by the Admiralty of all ships in the British navy into classes, by which certain allowances, the complement of officers, and other arrangements, are regulated. Ratings differ from time to time as the general size of the vessels increases. The classification at present (1865) is as follows: 1. Rated ships. *First-rates*—all ships carrying 110 guns and upwards, or 1000 men and upwards. *Second-rates*—one of the Queen's yachts; all ships above 80 guns and under 110, or with crews of from 800 to 999 men. *Third-rates*—the Queen's other yachts; all flag-ships or guard-ships (not of higher rates); all ships of 60 to 80 guns, or carrying 600 to 799 men. *Fourth-rates*—all frigate-built ships carrying from 410 to 600 men. *Fifth-rates*—all ships of from 300 to 400 men. *Sixth-rates*—all other ships bearing captains. 2. Sloops—comprising all vessels bearing commanders, and having the principal armament on one deck in broadside ports. 3. Gun-vessels—all vessels having and carrying their principal armament on one deck amidships. 4. All other ships and smaller vessels commanded by lieutenants.

RA'TIO. See PROPORTION.

RATION, in the Army and Navy, is the allowance of provisions granted to each officer, non-commissioned officer, soldier, or sailor. The United States navy ration consists of 1 lb. of salt pork, ½ pint of beans or peas, or 1 lb. of salt beef with ½ lb. of flour, 2 oz. of dried apples or other dried fruit; or ¾ lb. of preserved meat, with ½ lb. of rice, 2 oz. of butter, and 1 oz. of desiccated mixed vegetables; or ¾ lb. of preserved meat, 2 oz. of butter, and 2 oz. of desiccated potato, together with 14 oz. of biscuit, ¼ oz. of tea, or 1 oz. of coffee or cocoa, 2 oz. of sugar, and a gill of spirits, and a weekly allowance of ½ lb. of pickles, ½ pint of molasses, and ½ pint of vinegar. 1 lb. of soft bread, or 1 lb. of flour, or ½ lb. of rice, may be substituted for 14 oz. of biscuit; ½ pint of wine for a gill of spirits; ½ lb. of rice for ½ pint of beans or peas; ½ pint of beans or peas for ½ lb. of rice, if such changes should be necessary. Also, if necessary, the daily allowance may be diminished or varied by discretion of the senior officer present in command, but allowance must be made therefor according to a scale of prices. Formerly the spirit-ration was supplied, but it was abolished in 1862, and commuted at 5 cents per day additional pay. The commutation price of the navy ration is still 25 cents, without reference to the 5 cents addition above-mentioned.

The army ration (established Aug. 3, 1861, for the war) consisted, for one person, of 12 oz. of pork or bacon, or 1 lb. 4 oz. of salt or fresh beef, 1 lb. of soft bread or flour, or 1 lb. of hard bread, or 1 lb. 4 oz. of corn meal; and to every 100 rations 15 lb. of beans or peas, 10 lb. of rice or hominy, 10 lb. of green coffee, or 8 lb. of roasted coffee, or 1 lb. 8 oz. of tea, 15 lb. of sugar, 4 qts. of vinegar, 1 lb. 4 oz. of adamantine or Star candles, 4 lb. of soap, 3 lb. 12 oz. of salt, 4 oz. of pepper, 30 lb. of potatoes, when practicable, and 1 qt. of molasses.

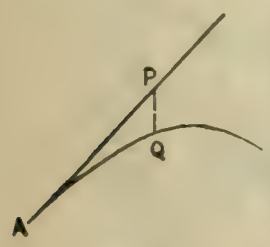
Double rations are allowed to the general-in-chief commanding the army; to each general officer commanding in chief a separate army actually in the field; to each general officer commanding a geographical division; and to each officer commanding a military geographical department. Every commissioned officer, including retired officers, is entitled to an additional ration per day for every five years' service, and surgeons after ten years' continuous service.

RA'TIONALISM (Lat. *ratio*, reason) strictly signifies that method of thought which in matters of religion not only allows the use of reason, but considers it indispensable. The term has now, however, acquired a wider meaning, and stands in opposition to *Supranaturalism*, or the belief in that which either transcends, or, as others view it, contradicts, both nature and reason—as, for example, miracles. To comprehend rightly the struggle between Rationalism and Supranaturalism, in modern Protestant theology, one must look at it from a historical point of view. The German and Swiss divines, in maintaining their polemic against Roman Catholicism (after the original enthusiasm of the Reformation had cooled down), took their stand on the absolute authority of the Bible as a purely divine book, containing no admixture of error of any kind, either in form or substance—the very vowel-points of the Hebrew (an innovation long posterior even to Christianity) being expressly held to be inspired. This, the oldest and most stringent kind of Protestant orthodoxy, gradually fell to pieces, partly on account of its unscientific character, and partly because it was demonstrated that the Bible itself put forth no pretensions to such infallibility. The first concessions to Rationalism were the admissions that the biblical writers differed in regard to their style and literary merit; next (as a logical inference from the foregoing), that they exercised a certain amount of independent power in the composition of their works. But gradually other points were assailed, some of which have been surrendered, while others are still tenaciously held; as that, in matters of physical science, the sacred writers spoke according to the conceptions and beliefs prevalent in their age, and not according to any supernatural enlightenment; that, on historical points, their information might be either erroneous or defective, or both; that they might err in anything except religious doctrine or sentiment; finally, that they might err in such too, and that the Bible is not the 'Word of God,' but only contains that 'Word,' which it is the province of human reason to discover, and to separate from whatever accretions of fable, myth, symbolism, or error have grown over it through the agency of man or the lapse of time. This is properly the theological Rationalism of modern times, and is held in Germany, France, Holland, England, and America by

many divines, who, nevertheless, look upon themselves as essentially Christian in their creed. But as most investigators that proceed so far, take yet a further step, and deny the presence of any element other than human in the Bible, or that there is any satisfactory evidence of the truth of its alleged supernaturalism, the word Rationalism has, in vulgar parlance, come to be synonymous with infidelity. It may also be added that the term Rationalism is also employed in a restricted sense to denote the method of substituting for the miraculous and supernatural in Scripture, something considered reasonable—e. g., the miracle of the crossing of the Red Sea is explained by the hypothesis that the Israelites crossed when the tide was out, while the Egyptians, hurriedly pursuing them, were taken in the returning waters. The leader of this school was *Paulus* (q. v.), whose system, after a time, gave way to the more scientific mythical theory of Strauss (q. v.).

RATIOS, PRIME AND ULTIMATE. There can be little doubt that Newton discovered by means of fluxions, of which he was in possession at a very early age, the greater part of that extraordinary series of theorems regarding motion, &c., which he first published in the *Principia*. He had, however, a great partiality for the synthetic form of demonstration, employed with such success by the Greek geometers; and the consequence was that, in the *Principia*, he avoided entirely the use of analysis by fluxions, and invented for synthetical applications the closely allied method of Prime and Ultimate Ratios. The fundamental idea involved in fluxions, prime and ultimate ratios, and the differential calculus, is the same, that of a *Limit* (q. v.).

To give an idea of the nature, as well as to shew the origin of the name, of the method, we may take a very simple case. Let a particle be projected in the direction AP; it will move uniformly in that line for ever, unless deflected from it by some external force. See MOTION, LAWS OF. Suppose that gravity alone acts upon it, then (see PROJECTILES) it will describe a parabolic path, AQ, to which AP is the tangent at A; and the line PQ, which joins the disturbed and undisturbed positions of the particle at any instant, is vertical. Now, the lengths of AP and AQ are not, in general, equal, but they are more and more nearly equal as both are smaller; and, by taking each small enough, we may make the *percentage* of difference between them as small as we choose. In other words, their *prime ratio*, just at A, is unity. Again, the inscribed square is less than a circle; the octagon greater than the square, but less than the circle; the regular polygon of 16 sides greater than the octagon, but less than the circle; and so on, constantly doubling the number of sides. But it can be shewn that the difference of area between the polygon and the circle may be made as small a percentage of the area of the circle as we please, by making the sides of the polygon numerous enough. Hence, the *ultimate ratio* of the areas of the circle, and inscribed polygon with an indefinitely great number of equal sides, is unity.



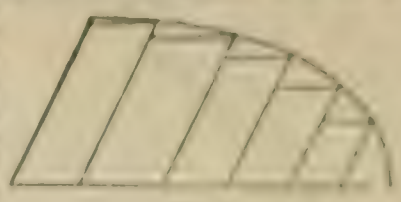


Fig. 1.

The basis of the method, which is implicitly involved in the foregoing illustrations, is Newton's *First Lemma:* 'Quantities, and the ratios of quantities, which tend constantly to equality, and may be made to approximate to each other by less than any assignable difference, become ultimately equal.' In other words, if we can make the percentage of difference of two quantities as small as we choose, we must produce at last equality.

From this, in his second and third Lemmas, Newton proves the fundamental principle of the integral calculus as applied to the determination of the areas of curves, by shewing that if a set of parallelograms as in the figure, be inscribed in any curvilinear space, the percentage of difference between the sum of their areas and that of the curve may be made as small as we please by diminishing indefinitely the breadth of each parallelogram, and increasing their number proportionally.

Fig. 2.

Next, he shews how to compare two curvilinear spaces, by supposing them filled with parallelograms, each of the first bearing to one of the second a constant ratio.

Next, that the homologous sides of similar *curvilinear* figures are proportional.

The sixth Lemma is merely a definition of continuous curvature in a curve, as distinguished from abrupt change of direction.

The seventh, eighth, and ninth Lemmas are of very great importance. The general principle involved in their proof is this—to examine what occurs in indefinitely small arcs, by drawing a magnified representation of them such as always to be on a finite scale, however small the arcs themselves may be. Thus, to shew that the chord of a small arc is ultimately equal to the arc of which we have in Trigonometry (q. v.) as a particular case, the ultimate equality of an arc and its sine—he

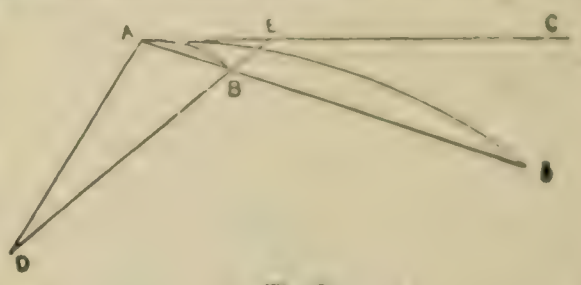

Fig. 3.

proceeds somewhat as follows: Let AB be an arc of continued curvature, AC the tangent at A. Produce the chord AB till it has a *finite* length, A*b*. Describe on A*b*, as chord, an arc similar to AB. This, by a previous lemma, will touch AC at A. Now, as B moves up to A, let the same construction be perpetually made, then *b* will approximate more and more closely to AC because the arc AB is one of continuous curvature, and the magnified arc will constantly lie between AC and A*b*. Hence, ultimately, when A*b* and AC coincide in direction, the arc A*b* (which is always between them) will coincide with A*b*. Similarly, AD being any line making a finite angle with AC, draw DBE cutting off a finite length from AD; this process enables us to prove that the triangles AED, and the rectilinear and curvilinear triangles ABD, are all ultimately equal.

Finally (and this is the step of the greatest importance in the dynamical applications), if the lines AD, DE, D*E'* be drawn under the above restrictions, the ultimate ratio of the curvilinear or rectilinear triangles AEB, AE*B'* is that of the squares

of corresponding sides. From this, in the ninth and last Lemma, it is easily shewn that the spaces described under the action of a finite force have

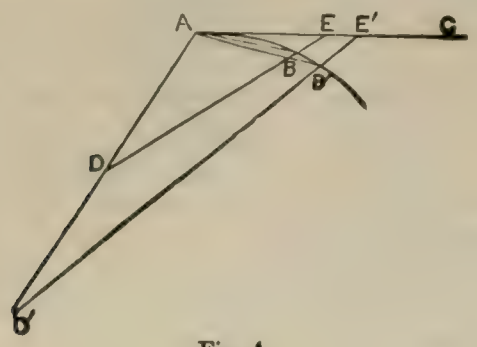

Fig. 4.

their prime ratios as the squares of the times; whence we pass at once to the ever-memorable investigations of the *Principia* regarding the orbits described under the action of various forces.

The method of prime and ultimate ratios is little used now (except in Cambridge, which does honour to itself in making part of the *Principia* a subject of study), as the differential and integral calculus help us to the required results with far greater ease. But to the true student of natural philosophy, the synthetic method of Newton is of very great value, as it shews him clearly at every step the nature of the process he is carrying out, which is too apt to be lost sight of entirely in the semi-mechanical procedures common to all forms of symbolical reasoning.

RA'TISBON. See REGENSBURG.

RA'TLINES, or RATLINGS, are steps in the ladders by which sailors ascend from the deck to the mast-heads. They consist of thin cords fastened horizontally across the shrouds at an easy step apart, thus forming a convenient ladder. To prevent the ratline slipping, it is commonly tied to the shroud in a peculiar knot called a clove-hitch.

RAT-SNAKE (*Ptyas mucosus*, Cope), a serpent of the family *Colubridæ* (see COLUBER), which is often kept in a state of domestication in Ceylon, on account of its usefulness in killing rats. Like the rest of its family, it is destitute of poison-fangs. It is capable of being rendered very tame, and displays considerable intelligence.

RAT-TAIL MAGGOT, the larva of a dipterous insect, *Eristalis tenax*, of the family *Muscidæ*. It inhabits mud, and breathes by means of tubes attached in telescope fashion to the tail, which terminates in a brush of hairs, and is always held up to the surface of the water, being elongated when the depth of water increases. The perfect insect is very like a bee.

RATTA'N, RATAN, or ROTTANG (*Calamus*), a genus of palms very different in habit from most of the order; having a reed-like, slender, often jointed, and extremely long stem, sometimes even 1000 feet or upwards in length. The name R. is extended to others of the same tribe of palms, having the same general habit, although constituted by botanists into different genera. The stem, which is very smooth, and hard and silicious externally, is either erect, or ascends and descends among trees; often laying hold as it ascends by means of hooked prickles, the extremities of the midribs of its leaves, which are scattered at considerable intervals along its whole length, and envelop it by their sheathing stalks, and then descending in graceful festoons to climb again a neighbouring tree. Sometimes, however, there are no leaves scattered along the stem. Sir James E. Tennent says, in his work on Ceylon: 'I have seen a specimen 250 feet long, and an inch in diameter, without a single irregularity, and no appearance of foliage other than the bunch of feathery leaves at the extremity.' The leaves are always pinnate, and very beautiful. The fruit is a dry berry, covered with imbricated scales, and generally one-seeded.

The species are very numerous, all natives of the East Indies. A few species are found in the southern parts of India; but they abound along the southern foot of the Himalaya, in Chittagong, Silhet, Assam, the south-east of Asia, and many of the islands of that region. They are all very useful, are much employed in their native countries, for making plaited work, ropes, &c., and are very largely imported into Britain and other parts of the world, generally under the name of *Cane*, and chiefly in order to be used for plaited or wicker work. —Bridges of great strength are made, in some parts of the East, of the stems of these palms. They are twisted into ropes in some parts of the East, which are used for binding wild elephants, and for other purposes requiring great strength; the vessels of Java, Sumatra, and neighbouring regions, are very generally furnished with cables made of them, which are extensively manufactured at Malacca; and the Chinese make ropes of rattans by splitting them longitudinally, soaking them, and attaching them to a wheel, which is kept in motion, whilst new rattans are added, one by one, to increase the length of the rope.—The species called *Calamus rudentium*, which has very long stems, is much employed in rope-making. Many species probably furnish the canes of commerce, one of which, *C. verus*, a native of India, is only about 20 feet in length. The elegant walking-canes called

Calamus, or Rattan:
a, part of a stem with leaves; *b*, inflorescence.

Malacca Canes are believed to be the produce of *C. scipionum*; the plant, however, does not grow in Malacca, but in Sumatra.—Small stems of R. are used as a substitute for whalebone in umbrellas.—The fruit of some species of R. is a delicate article of food; and the young shoots, variously dressed, are equal to the finest of vegetables.—A very fine kind of *Dragon's Blood* (q. v.), is obtained from a species of R. (*C. Draco*), and particularly from the fruit, on the surface of which it appears as a

resinous exudation. Various methods are employed for collecting it.

The canes of commerce are usually imported in bundles of 100 canes, each cane from 15 to 20 feet in length. Rattans and reeds were imported into the United States, in 1870, to the value of $3793.

RATTANY, or **RHATANY** (*Krameria triandra*), a half-shrubby plant, of the natural order *Polygalæ*, a native of the cold sterile table lands of the Andes in Peru and Bolivia. It is called *Ratanhia* in Peru. It is valued for the medicinal properties of the root, which are shared more or less by other species of the same genus, also natives of South America. The dried root is a powerful astringent, and a useful tonic; and is employed in mucous discharges, passive hæmorrhages, and cases of relaxation and debility. It is also used as a tooth-powder, often mixed with orris root and charcoal. R. root is imported from different parts of South America, but chiefly from Lima. It is extensively imported into Portugal in order to communicate a rich red colour to wines. The peculiar properties of R. root are supposed to be chiefly owing to an acid called *Krameric Acid*.

RATTAZZI, URBANO, an Italian statesman, was born in the middle ranks of life, at Alessandria (Piedmont), in 1810. He was an advocate at Casale, where, in 1847, he was President of the Agricultural Committee. After the proclamation of the constitution in 1848, he was elected member for Alessandria, and began his political career as a democrat. His knowledge, eloquence, and liberal principles raised him to the ministry, and his first act was to write to the bishops, threatening to have them arrested, if they should preach against liberty. He resisted his chief, Gioberti, who wished to send Piedmontese soldiers into Tuscany and Rome, to prevent the occupation of these places by the Austrians and French; urged Charles Albert into a new war with Austria, and after the defeat of Novara, was obliged to retire from the ministry. After Napoleon's *coup d'état*, the liberty of Piedmont was threatened, and Cavour, R., and their parties joined together to defend it. This union was called *connubio*. R. took the portfolio of Minister of Justice in the Cavour Ministry in 1854, and presented the bill for the abolition of convents. The priests were up in arms against him, and he was strenuously opposed by the Catholic party. After the Mazzinian movement in 1857, being accused of weakness in suppressing it, he retired. After the peace of Villafranca, he returned to the ministry. He did not wish to accept definitively the annexation of the Duchies, because he knew that the price of it was Savoy and Nice, which he was unwilling to give up; and being, as is alleged, secretly undermined by Cavour and Sir James Hudson, he fell. He returned to the ministry in 1862, after having made an agreement with Garibaldi to give the assistance and support of the government for an expedition into Turkey. It is alleged that Sir J. Hudson knew it, and in order to dissuade Garibaldi from the enterprise, instigated him to go to Rome. The result was Aspromonte. After that tragedy, R. retired from the ministry, but was again in office from April to October, 1867. He was an able administrator, an eloquent orator, and much liked by the king.

RA'TTLESNAKE (*Crotalus*), a genus of serpents of the family *Crotalidæ*, distinguished from the rest of that family by the rattle at the end of the tail. They are also characterised by having only one row of plates under the tail. The genus is subdivided by many authors according to the scales and shields with which the head is covered in different species. All the species are American, and are much dreaded for their deadly venom, although they seldom assail man, unless molested, and the rattle often gives timely warning of danger. The R. is often found at rest in a coiled form, with the rattle somewhat erected from the centre of the coil; and when it begins to be irritated the rattle shakes. Rattlesnakes are generally rather sluggish in their movements, but they are most active and most dangerous in the warmest weather, their bite being more formidable at such a time, as well as more readily inflicted. The effects of the bite are various, according not only to the constitution of the serpent, but also according to the constitution of the person bitten, and the place into which the fangs have been inserted, the worst case being when the poison immediately enters a large vein, and so is carried at once to the most vital parts. Death to human beings has been known to ensue in a few minutes, whilst in other cases, hours or days have elapsed, and sometimes the sufferer recovers. Almost all animals show what may be deemed an instinctive dread of the R., and a great unwillingness to approach it. Hogs and peccaries, however, are so far from regarding it with dread, that they kill and eat it, having secure from its venom probably not in any peculiarity of constitution, but in their thickness of skin, and the thickness of the layer of fat under the skin. Rattlesnakes are viviparous, and exhibit attachment to their young. Seventeen species of the restricted genus are known, of which 3 are from Brazil, 4 from Mexico, and the remainder from North America. Ten of the latter are found in the Sonoran and Arizonian regions, 1 in California, 3 in the plains, and 2 in the Atlantic States. One of the American species (*C. cerastes*) lives in the desert, and, like the horned viper of the Sahara, has horns above the eyes.

The rattle is a very peculiar appendage. It consists of a number of thin horny cells, jointed together; each, except the terminal one, of a conical form, and in great part covered by that next to it, against the sides of which its apex strikes when the rattle is shaken, so as to produce a rustling or rattling noise. It is known

Rattlesnake (*Crotalus horridus*).

that the number of joints in the rattle increases with the age of the serpent, one being added at each casting of the skin. One species of R. (*Crotalus durissus*), sometimes called the CASCAVELA, is found in the warm parts of South America. Its muzzle is covered by three or four pairs of plates. Its scales have a sharp elevated keel. It attains the length of eight feet, although it is seldom found of so great a size. Its colour is yel-

lowish-brown above, with a broad dark streak on each side of the neck, and a series of broad lozenge-shaped spots on the back. — Another species, *Crotalus horridus*, extends further northward, as far as the southern shores of the great lakes. It is of a pale brown colour, with a dark streak across the temples, and dark spots on the body, often assuming the form of bands; the keel of the scales not so strongly developed, and the muzzle with fewer shields than in the former species, which it resembles in size. A third species, *Crotalus* or *Crotalophorus miliaris*, having the head completely covered with large shields, is also common in many parts of North America, and is as much dreaded as either of those already named, notwithstanding its much smaller size, because the sound of its rattle is so feeble as not readily to attract attention. It is of a brownish-olive colour, with brown spots on the back and sides, the belly black.—In the colder countries which they inhabit, rattlesnakes spend the winter in a torpid state, retiring for that purpose into holes, or hiding themselves among moss.

RATZ BOSZORMENY. See Böszormeny.

RAUCH, Christian Daniel, one of the most distinguished German sculptors, was born at Arolsen, the capital of the principality of Waldeck, in 1777. He early began the study of sculpture; but on the death of his father, in 1797, he was obliged to go to Berlin, where he became valet to Frederick-William II., king of Prussia. On the death of that prince, R. determined to follow the bent of his inclination for the fine arts. In this he was assisted by the new king Frederick-William III., who afforded him facilities for designing and modelling statues, and recommended him as a pupil in the Academy of the Fine Arts. A statue of Endymion and a bust of Queen Luise of Prussia executed at this time, convinced the king of R.'s abilities, and he gave him the means of proceeding to Rome for his further improvement. R. spent six years in that city, working at his profession with much assiduity, to render himself worthy of the friendship of Thorwaldsen and Canova. At Rome, he also enjoyed the friendship of William Humboldt, at that time Prussian minister there.

Among his works at this time were bassi-rilievi of 'Hippolytus and Phædra,' a 'Mars and Venus wounded by Diomedes,' a colossal bust of the king of Prussia, and busts of Raphael Mengs and the Count de Wengersky. In 1811, he was called by the king of Prussia to Berlin to execute a monumental statue of Queen Luise. This great work obtained for R. a European reputation. It is placed in the mausoleum of the queen in the garden of Charlottenburg. R. was not, however, quite satisfied with this triumph of his art, but commenced a new statue of the queen, which he finished 11 years afterwards, and which is allowed to be a masterpiece of sculpture. It is placed in the palace of Sans Souci, near Potsdam. R., after this, lived principally at Berlin, but occasionally visited Rome, Carrara, and Munich. He laboured indefatigably in his profession, and by 1824, had executed 70 busts in marble, of which 20 were of colossal size.

R.'s principal works, besides those above mentioned, are—two colossal bronze statues of Field-marshal Blücher, one of which was erected, with great solemnity, at Breslau in 1827; a bronze statue of Maximilian of Bavaria, erected at Munich in 1835; and statues of Albert Dürer, Goethe, Schiller, and Schleiermacher, erected in various places in Germany. His greatest work is the magnificent monument of Frederick the Great, which adorns Berlin. The model for this statue was designed by R. in conjunction with Professor Schinkel, the architect, in 1830; and after 20 years' labour, the statue was finished in 1850, and was inaugurated with great pomp in May 1851.

In his works, R. has the merit of having surmounted the difficulties which modern costume opposes to the ideal representation of personages of the present age; and while he preserved the salient points of his model, he possessed the art of sacrificing the less important details to the exigences of the beautiful. He died at Dresden on December 3, 1857.

RAU'HÉS HAUS is the name of a great institution founded and hitherto managed by Wichern at Horn, near Hamburg, in connection with the German Home Mission (*Innere Mission*). It is partly a refuge for morally neglected children; partly a boarding-school for the moral and intellectual education of children of the higher classes; lastly, a training-school for those who wish to become teachers or officials in houses of correction, hospitals, &c., in promotion of the objects of the Home Mission. The first foundation of this model institution—for such it has become for Germany as well as for France—was laid by a wealthy citizen of Hamburg, who made over to it a piece of land. It was opened on November 1, 1831, by Wichern with 12 morally neglected children. By the addition of new houses, the whole has, however, been very much enlarged, and has of late almost grown into a colony. A printing-office, a bookbinder's shop, and bookselling form part of the institution. Recently, about 100 neglected children (one-third are girls) receive their education in the establishment. They live in families of twelve, each family being under the paternal superintendence of a young artisan, who employs the children according to their capabilities, partly in indoor, partly in outdoor, manual labour. The watching and care of these children devolve on assistants, who also take part in the instruction of the institution, with a view to prepare themselves for the work of the Home Mission in other institutions. These instructors receive board and clothing, but no salary. In connection with the R. H., there was founded in 1845 a kind of conventual institute for the education of young men, with a view to become heads or superintendents of similar institutions. Entrance into this institution is limited to the age of 20—30. Besides religious belief and good character, freedom from military duties, bodily and mental health, some scholastic acquirements, and a knowledge of some craft or of agriculture, are required. The boarding-school was established in 1851, and at the same time a seminary was founded, in which 12 brethren of the R. H. are especially prepared for school-work.

RAUMER, Fried. Ludw. Georg von, a noted German historical writer, was born on May 14, 1781, in Wörlitz, near Dessau; studied law and political economy at Halle and Göttingen; filled different law appointments (1806—1811); and in the last-mentioned year was named Professor at Breslau. In 1819, he was called to Berlin as Professor of History and Political Economy. Among his writings may be mentioned—*Sechs Dialoge über Krieg und Handel* (1806); *Das Brittische Besteuerungssystem* (Berl. 1810); *The Orations of Æschines and Demosthenes de Corona* (Berl. 1811); *CCI Emendationes ad Tabulas Genealogicas Arabum et Turcarum* (Heidelb. 1811); *Handbuch merkwürdiger Stellen aus den lat. Geschichtschreibern des Mittelalters* (Handbook of Remarkable Passages in the Latin Historians of the Middle Ages, Bresl. 1813); *Vorlesungen über die alte Geschichte* (Lectures on Ancient History,

2 vols. Leip. 1847); *Geschichte der Hohenstaufen und ihrer Zeit* (History of the Hohenstaufen dynasty and their Time, 6 vols. Leip. 1823–1825); *Ueber die geschichtliche Entwickelung der Begriffe von Recht, Staat und Politik* (On the Historical Development of the Ideas of Law, State, and Politics, 2d ed. Leip. 1832); *Prussian Municipal Law* (Leip. 1828); *Briefe aus Paris und Frankreich*, 1830 (2 vols. Leip. 1831); *Briefe aus Paris zur Erläuterung der Geschichte des 16th und 17th Jahrh.* (2 vols. Leip. 1831); *Geschichte Europas seit dem Ende des 15 Jahrh.* (History of Europe from the End of the 15th Century, vols. 1–8, Leip. 1832–1850); *England*, 1835 (2 vols. Leip. 1836); *England*, 1841 (3 vols. Leip. 1842); *Beiträge zur Neuern Geschichte aus dem Brit. Museum, &c.* (5 vols. Leip. 1836–1839); *Italie: Beiträge zur Kenntniss dieses Landes* (2 vols. Leip. 1840); *Die Vereinigten Staaten von Nordamerika* (2 vols. Leip. 1845); *Antiquarische Briefe* (Leip. 1851). The unfavourable reception of an oration of R. in honour of King Frederick II. compelled him, in 1847, to resign the secretaryship and membership of the Academy of Sciences at Berlin, in consequence of which he was elected town-councillor of Berlin, and member of the Frankfurt Parliament, where he belonged to the right centre. From Frankfurt, he went as ambassador to Paris. Subsequently, he became a member of the first chamber at Berlin. In 1853, he was nominated, at his own request, Professor Emeritus at the university of Berlin.

RAUMER, KARL GEORG VON, brother of the preceding, was born April 9, 1783, in Worlitz, studied from 1801—1805 at Göttingen and Halle, then at the Mining Academy at Freiberg, and was appointed Professor of Mineralogy at Breslau University in 1811. He took part as a volunteer in the War of Liberation (1813—1814), was translated in 1819 to the university of Halle; and finally, in 1827, was appointed Professor of Mineralogy and Natural History in the university of Erlangen. R. has obtained a wide and well-deserved reputation by his geographical and geological writings, among which are *Geognostische Fragmente* (Geognostic Fragments, Nürnb. 1811); *Der Granit des Riesengebirges* (The Granite of the Riesengebirge, Berl. 1813); *Das Gebirge Niederschlesiens* (The Mountains of Lower Silesia, Berl. 1819); *A B C Buch der Krystallkunde* (The A B C of Crystallography, 2 vols. Berl. 1817; supplem. 1821). His interest in literary and scholastic education is evinced in his valuable *Geschichte der Pädagogik* (History of Pedagogy, 4 vols. Stuttg. 1846–1855). Other works of more or less consequence are his *Lehrbuch der allgemeinen Geographie* (Manual of Universal Geography, Leip. 1848); *Palestine* (Leip. 1850); *Der Zug der Israeliten aus Aegypten nach Canaan* (Leip. 1837); and *Kreuzzüge* (Stuttg. 1840).

RAUPACH, ERNST BENJ. SAL., a German dramatist, born on May 21, 1784, in Straubitz (Silesia), received his education in the Gymnasium at Liegnitz, studied theology at Halle, was for ten years tutor in Russia, held lectures at St Petersburg University, and was subsequently (1816) appointed there Professor of Philosophy, German Literature and History. R. left Russia in 1822, and died at Berlin, March 18, 1852. Among his early plays, the following are noteworthy—*The Princes Chawansky* (1818); *Die Gefesselten* (The Enchained, 1821); *Der Liebe Zauberkreis* (The Magic Ring of Love, 1824); *Die Freunde* (The Friends, 1825); *Isidor und Olga* (1826); *Rafaele* (1823); *Die Tochter der Luft* (The Daughter of the Air), after Calderon (1829). Among his comedies may be mentioned *Cäsar und Antonie*, *Die Schlacht der* (The Sons [illegible]); *Der Patriot* (The Spirit of the Times); *Der Sonnenwirth* (The Sun Inn); *Dank an Cäsar* (Gratitude to Cæsar); and *Schule im Moose*. Of his posthumous works the principal are—*Joachime von Hohenstaufen* (1837); *Der Kabinetsspieler* (The Player at Sovereignty); the tragedy, *Mutter Gesang in Lodosa* (1854); and *Spiel und Ernst* (1850). R.'s works display great knowledge of stage effect, a happy talent for the invention of new and interesting situations, a power of vivid dramatic diction, and a fine play of verbal wit.

RAVAILLAC, FRANÇOIS, a native of the French province of Angoulême, where he was born in 1578, has acquired an odious reputation as the murderer of Henri IV. of France. In early life, R. was in turn clerk to a notary and master of a school; but having fallen into debt he was thrown into prison, the confinement and restraint of which preyed upon his health, and produced hallucinations of mind. Under the influence of this mental excitement, he renounced all worldly pursuits; and on his release from prison, after having served for a time in the order of the Feuillants, he fell under the influence of the Jesuits, through whose instrumentality it is believed that his insane hatred of the Huguenots, as the enemies of the church, was directed more especially against Henri of Navarre, their former leader. Having resolved to assassinate the king, he eagerly watched his opportunity, and on the 14th of May 1610, as the king was passing in his coach through the narrow street of Laferronnerie, got upon the right hind-wheel of the carriage at the moment that its further advance was hindered by a heavy waggon in front of it, and leaning forward, he plunged a knife into the breast of the king. The first blow glanced aside, but at the second thrust, the knife entered the heart. R. escaped in the confusion, but being soon captured with the knife still in his hand, he admitted his guilt; and having been formally tried and condemned, he was put to the torture; and suffered death on May 27, in the Place de Grève, under circumstances of great cruelty, his body being torn asunder by horses. R. refused to the last to acknowledge whether he had had instigators or abettors, and hence the widest scope was given to conjecture, suspicion being in turn directed to the queen, Marie de' Medici, and her favourites, the Concini, to the Duc d'Epernon, and to the Spanish court and their Jesuit advisers, but there is no good ground for such suspicions. M. Henri Martin (*Histoire de France*) and M. Poirson (*Histoire de Henri IV., tome II.*) have examined the particulars of the process instituted against R. with scrupulous impartiality, and have come to the conclusion that the real cause of the crime was fanaticism degenerated into monomania.

RÂVAN'A (from the causal of the Sanscrit *ru* cry, alarm, hence literally he who causes alarm) is the name of the *Râkshasa* (q. v.) who, at the time of Râma, ruled over Lankâ or Ceylon, and having carried off Sitâ, the wife of Râma, to his residence, was ultimately conquered and slain by the latter. Râvan'a is described as having been a giant with ten faces, and in consequence of austerities and devotion, as having obtained from Siva a promise which bestowed upon him illimited power, even over the gods. As the promise of Siva could not be revoked, Vishn'u evaded its efficacy in becoming incarnate as Râma, and hence killed the demon-giant. See under VISHN'U and RÂKSHASA.

RAVELIN, in Fortification, is a triangular work of less elevation than the main defences, situated with its salient angle to the front before the curtain,

which with the shoulders of the adjoining bastions, it serves to protect. It is open at the rear, so as to be commanded by the curtain, if taken, and is separated from that work by the main ditch, while in its own front the ditch of the ravelin intervenes between itself and the covert-way. The guns of the ravelin sweep the glacis, and perform a very important function in commanding the space immediately before the salient angles of the two next bastions, ground which the guns of the bastions themselves cannot cover. The bastions, on the other hand, flank the ravelin. In the fortifications of Alessandria, designed by Bousmard in 1803, the ravelins are placed in front of the glacis. See the diagrams in art. FORTIFICATION.

The original name of the ravelin was *rivellino*, which indicates a derivation from *vegliare*, to watch, the ravelin having probably been at first a watch-tower, answering to the still earlier barbacan.

RAVEN (*Corvus carnivorus*), a species of crow, remarkable for its large size. It is more than two feet in length from the tip of the bill to the extremity of the tail. The bill is thick and strong, compressed at the sides, the mandibles sharp at the edges; the upper mandible curved at the tip, and exceeding the lower in length. The base of the

Raven (*Corvus carnivorus*).

bill is surrounded with feathers and bristles. The tail is rounded, but the middle feathers are considerably the longest. The wings are long — extending from tip to tip to 52 inches—the fourth quill-feather being longest. The colour is a uniform black, with more or less of metallic lustre, which is particularly conspicuous in the elongated throat-feathers of the male, and is wanting in the whole plumage of the female and young.

The R. is a bird of wide geographic distribution. It is found in almost all parts of North America, but most abundantly in the more northern and the mountainous parts of it. In other parts of the world, and within the northern hemisphere itself, however, other closely allied species exist; *C. corax* is the European R. There are several species of crow very similar to the R. in colour, size, and habits.

The R. is generally to be seen either solitary or in pairs. It is one of the most thoroughly omnivorous of birds. It feeds on fruits and nuts in forests; it picks up worms or molluscs; it sucks eggs; it kills young hares, or even lambs; it rejoices in carrion, and not unfrequently attacks weak or sickly beasts, almost invariably choosing their eyes as its first point of assault. It generally makes its nest of sticks, coarse weeds, wool, hair, &c., in rocky places, on a narrow ledge of a precipice, or in some similar situation. Ravens are occasionally captured when young, and become interesting pets, being remarkable for their impudence and cunning, their look of sage thoughtfulness, their inquisitiveness, their mischievous propensities, which prompt them to destroy everything that can be destroyed, and always as if the fact of its destruction afforded them pleasure, their thievishness, their love of glittering things, and their power of imitating human speech, which is almost equal to that of parrots. The R. is celebrated for its longevity, and instances are on record of ravens which have certainly lived for seventy or eighty years. The R. has been generally reckoned a bird of ill-omen, probably on account both of its colour and its extremely harsh croaking voice, which may sometimes be heard in fine weather as if coming from the sky, the R. being a bird of powerful wing, and often soaring very high in the air.

RAVE'NNA, an important city of Central Italy, 43 miles east-south-east from Bologna, and 4½ miles from the Adriatic; lat. 44° 24′ N., long. 12° 12′ E. Pop. (1862) of the commune, 57,303; of the town proper, 19,118. It is situated in the midst of a well-watered, fertile, and finely-wooded plain. R. is surrounded by old bastions, and by walls where may still be seen the iron rings to which the cables of ships were formerly fastened; the sea is now at the distance of about 4 miles from the city. The streets are wide; the squares are adorned with statues of the popes, and the houses have a gloomy appearance. R. is an ancient city, rich in monuments of art. The cathedral was built in the 4th c.; it has five naves, supported by 24 marble pillars, and in the sacristy there are preserved the ivory chair of St Massimino and the Calendario Pasquale, both of the 4th century. San Francesco possesses the tomb of Dante, erected in the 15th century. The library of R. contains 50,000 volumes. It has an archæological museum, and many educational institutions. There are manufactures of silk, linen, paper, glass, and kitchen utensils.

R. was probably of Umbrian origin; it was at least an Umbrian city when it passed into the hands of the Romans. Augustus made it a first-class seaport and naval station; 400 years later, the Emperor Honorius took refuge there, and made R. the capital of the empire. The city was taken by Odoacer, then by Theodoric and by Totila; the latter was conquered by Narses, who made it the residence of the exarchs in 553. In 1218, it became a republic. In 1275, Guido da Polenta conquered it, and there established his court, where he received Dante. R. was afterwards taken by the Venetians, who kept it till 1509. Under Charles V., it passed into the hands of the popes.

Under the walls of R., a great battle was fought in 1512 between the French and the Spaniards, in which Gaston de Foix purchased victory with his life.

RAVENSCROFT, THOMAS, an eminent English musical composer. He was born in 1592, received his musical education in St Paul's choir, and had the degree of Bachelor of Music conferred on him when only 15 years of age. In 1611, appeared his *Melismata, Musical Phansies, &c.*, a collection of 23 part-songs, some of them of great beauty; and three years later, he brought out another collection of part-songs under the title of *Brief Discourses*, with an essay on the old musical modes. Turning his attention to psalmody, he published, in 1621, a

collection of psalm-tunes for four voices, entitled *The Whole Book of Psalms, composed into Four Parts by Sundry Authors to such Tunes as have been and are usually sung in England, Scotland, Wales, Germany, Italy, France, and the Netherlands.* This was the first publication of its kind, and all similar works of later date have been largely indebted to it. Among the contributors to this collection were Tallis, Morley, Dowland, and all the great masters of the day; the name of John Milton, the father of the poet, appears as the composer of York and Norwich tunes; while St Davids, Canterbury, Bangor, and many others which have since become popular, are by R. himself. Each of the 150 Psalms has a distinct melody assigned it. Two collections of secular songs similar to the *Melismata*, and entitled *Pammelia* and *Deuteromelia*, have been assigned to R.; but it is probable that only a few of these songs were composed by him, while he may have revised and edited the whole. A selection from the *Melismata*, *Brief Discourses*, *Pammelia*, and *Deuteromelia* was printed by the Roxburghe Club in 1823. R. died about 1640.

RAVIGNAN, GUSTAVUS FRANCIS XAVIER DELACROIX DE, a celebrated preacher of the Jesuit order, was born at Bayonne, December 2, 1795. He studied in the Lycée Bonaparte at Paris, and having embraced the legal profession, and obtained his degree, was named auditor of the Cour Royale at Paris, and afterwards, in 1821, received an appointment in the Tribunal of the Seine. The prospect thus opened for him, however, soon lost its attraction, and in 1822 he formed the resolution of relinquishing his career at the bar, and entering the church. Having spent some time in the college of St Sulpice, he soon passed into the novitiate of the Jesuits at Montrouge, and thence to Dole and St Acheul for his theological studies, at the termination of which he was himself appointed a professor. On the expulsion of the Jesuits from France in 1830, R. withdrew to Freiburg in Switzerland, where he continued to teach in the schools of his own order; but after some time he was transferred to the more congenial duty of preaching, first in several of the Swiss towns, and afterwards in Savoy, at Chambery, at St Maurice, and other places. At length, in 1835, he appeared in the pulpit of the cathedral of Amiens. In the following year, he was chosen to preach the Lenten sermons at the church of St Thomas d'Aquin in Paris; and finally, in 1837, was selected to replace Lacordaire (q. v.) at Notre Dame, in the duty of conducting the special 'conferences' for men which had been opened in that church. For ten years, Père de R. occupied this pulpit with a success which has rarely been equalled, and his 'conferences' are regarded as models of ecclesiastical eloquence. In 1842, he undertook in addition to preach each evening during the entire Lent; and it is to the excessive fatigue thus induced that the premature break-down of his strength is ascribed. To the labours of the pulpit, he added those also of the press. He published an Apology of his order in 1844; and in 1854 a more lengthened work with the same view, *Clement XIII. et Clement XIV.*, 2 vols. 8vo, which was intended as a reply to the *Life of Clement XIV.*, by the Oratorian Father Theiner. These, with some occasional sermons and 'conferences,' constitute the sum of the publications issued during his life. In 1855, he was invited by the Emperor Napoleon III. to preach the Lent at the Tuileries. On the 26th February 1858 he died in the convent of his order at Paris, in his 63d year. His Memoirs have been published by his brethren, and a collected edition of his works and remains has been for some time in progress.

RAVINALA. See TRAVELLER'S TREE.

RAWAL PINDI, a large walled town of the Punjab, in the doab between the rivers Indus and Jhelum. It contains a large bazaar, and carries on an active transit trade between Hindostan and Afghanistan, but is not otherwise noteworthy. Pop. about 16,000.

RAWICZ, a town of Prussia, in the government of Posen, close to the Silesian frontier, 64 miles south of Posen by railway. It is surrounded by walls. Spinning, weaving, brewing, manufacture of tobacco and leather, and a considerable trade, are carried on. Pop. 10,517.

RAWLINSON, SIR HENRY, K.C.B., oriental scholar and diplomatist, was born at Chadlington, Oxfordshire, in 1810, and educated at Ealing, Middlesex. He entered the East India military service in 1826, and served in the Bombay presidency until 1833, when he was appointed to assist in reorganising the army of the Shah of Persia. He had early devoted himself to eastern languages and antiquarian researches, and when stationed at Kermanshah, in 1835, he began to study the cuneiform (q. v.) inscriptions of Persia. He announced his cuneiform discoveries in 1837–38 to the Royal Asiatic Society of London and published his travels in Susiana in the *Geographical Society's Journal*. In 1840, he obtained the Geographical Society's gold medal for his paper on Babylon. He also made a translation of the Behistun inscription. In 1840, he travelled through Sinde to Candahar, where he remained as political agent throughout the Afghan war, until the evacuation of the country in 1842. During this period, he assisted at General Nott's actions with the Afghans, and accompanied the Candahar column in the advance to Ghuzni and Cabul. See AFGHANISTAN. He was made C.B. for these services. Being transferred to Baghdad as political agent in Turkish Arabia in 1844, he remained there (with the exception of a visit to England in 1850 and 1851, when he returned with the rank of Consul-general) until 1855. Incited by the archæological and historical researches of Botta and Layard, he diligently occupied himself with the study of the Median, Persian, Assyrian, and Babylonian cuneiform inscriptions, the results of which have been partly incorporated in the translation of Herodotus published by his brother, Rev. G. Rawlinson of Oxford, partly given to the world by R. himself in the *Asiatic Society's Journal*. He retired from the East India Company's service with the rank of lieutenant-colonel, was nominated a Crown Director of the Company in 1856, and in January 1858 was elected M.P. for Reigate, but vacated his seat in September, on being appointed a member of the Council of India. In 1859, he proceeded to Teheran as envoy extraordinary and minister-plenipotentiary to the court of the Shah. He was admitted as corresponding member of the Institute of France in 1857, and in 1862 was made Chevalier of the Order of Merit by the king of Prussia. RAWLINSON, REV. GEORGE, brother of the preceding, graduated at Oxford, and was elected a fellow and tutor of Exeter College. Appointed Bampton lecturer in 1859, he published his lectures in the following year under the title of *Historical Evidence for the Truth of Christian Records*. Other works of R.'s are *Christianity and Heathenism* (1861); the edition of Herodotus before mentioned; and *The Five Great Monarchies of the Ancient World—Chaldæa, Assyria, Babylonia, Media, and Persia*.

RAY (*Raia*), a Linnæan genus of cartilaginous fishes, belonging to the order *Plagiostomi* (q. v.) of Müller, and now divided into a number of genera, which form the family *Raidæ* of many natu-

and the suborder *Raiæ* of some. The true rays have a flat body; the pectoral fins are large and fleshy, appearing as lateral expansions of the body, and along with it forming a circular disc or a rhomboid, to which is attached a rather long and slender tail. The pectoral fins are prolonged till they meet in front of the snout, and backwards till they join the ventral fins. The eyes look upwards, and the spout-holes or spiracles are also directed upwards. The gill-openings, which are five in number, are on the under side of the body, where also the mouth is situated. The gills are close behind the mouth; and towards the tail are the stomach, intestines, and other viscera, in a circular cavity. The males are furnished with claspers. The eggs are large, resembling those of sharks, but more rectangular in form; thin horny cases, with projections at each of the four corners, having such a resemblance to a hand-barrow, that on some parts of the English coast they receive the name *Skate-barrows*. They are also familiarly known as *purses*, and are very often to be seen cast up by the waves upon the beach. Rays live mostly near the bottom of the sea, and where the bottom is sand or mud. When disturbed, they glide in an undulating manner, and defend themselves against assailants by lashing with the tail, which is generally armed with spines, and in some species—called *Sting Rays* (q. v.), the family *Trygonidæ* of some naturalists—carries a single long and strong spine, notched on both sides, a formidable weapon, which is used somewhat as a saw. Rays are very voracious; they devour fishes, molluscs, and crustaceans. Many of the rays are popularly called SKATE. All of them are edible; some, however, are much better than others; and whilst, on some parts of the British coast, they are regularly used for food, and brought to market, on other parts of the coast, they are rejected, and are thrown out to rot on the beach. Of British species, two of the most common are the Thornback (q. v.) and the Homelyn (q. v.). Another is the Common Skate, also called the Blue Skate or Gray Skate (*Raia batis*),which is better than either the Thornback or Homelyn as an article of food. The Long-nosed Skate (*R. mucronata*) and the White Skate (*R. oxyrhynchus*) are also common. The skates sometimes attain a very large size, more than eight feet in breadth.—*Torpedo* (q. v.), *Cephaloptera* (q. v.), &c., are genera of rays.

RAY (or, as he himself occasionally spelt it, WRAY), JOHN, an eminent naturalist, was born at Black-Notley, near Braintree, in Essex, 29th November 1627. He went to Cambridge University, where, after having finished his course, he was elected a Fellow, and appointed Greek lecturer, and afterwards mathematical tutor in Trinity College; but after a time began to devote himself entirely to the study of natural history. Accompanied by a kindred spirit, Francis Willughby, a friend and former pupil of his own, R. travelled over most of the United Kingdom, collecting and investigating botanical and zoological specimens; and in 1663, they started on a tour through the Low Countries, Germany, Italy, and France, with a similar object, Willughby taking the zoology under his charge, leaving R. the botany. In 1667, R. was elected a Fellow of the Royal Society, to whose *Transactions* he occasionally contributed valuable papers. In 1672, his friend Willughby, with whom R. had lived ever since he had left the university, died, leaving him guardian to his two sons (the younger of whom was afterwards raised to the peerage as Baron Middleton), an office which R. discharged, and then, after several changes of residence, settled down in his native village, where he died, January 17, 1705. As a botanist and zoologist, R. ranks very high, being distinguished for his patience, acuteness, and sagacity; and in knowledge he seems to have been far in advance of his time, as the new method of classification of plants which he proposed, though little appreciated or adopted by his contemporaries and immediate successors, was eagerly laid hold of by Jussieu and others, under whose hands it became the foundation of what is now known as the 'Natural System' of classification. R.'s zoological works are considered by Cuvier as the foundation of modern zoology. In zoology, as in botany, R.'s works are remarkable for the precision and clearness of the classification which he adopts, his divisions in the former subject being founded on the structure of the heart and the organs of respiration. The chief of his works on botany are *Methodus Plantarum Nova* (1682, 2d edition, revised and amended by himself), in which he details the principles of his new method of classification of plants; *Catalogus Plantarum Angliæ* (1670), the basis of all the subsequent floras of this country; and a second (1677), third (1690), and fourth (1696) edition of which were published by himself; *Historia Plantarum* (3 vols. 1686—1704), a compilation, including descriptions of all the species which were then known. His zoological works include the *Synopsis Methodica Animalium, Quadrupedum et Serpentini Generis* (1693), and three posthumous volumes on Birds, Fishes, and Insects, published by Dr Derham. He was also the author of some theological works. His friend Willughby having collected the materials for an extensive work on the animal kingdom, left to R. the task of arranging and classifying them, and the work accordingly appeared in 3 vols., the *Ornithologia* in 1676, with an English translation by R. in the following year, and the *Historia Piscium* in 1686 (2 vols.). In these volumes were described a large number of species of birds and fishes, which had escaped the observation of previous naturalists.

RAYNOUARD, FRANÇOIS JUSTE MARIE, a French poet and philologist, was born at Brignoles, in Provence, September 8, 1761. He studied at Aix, and came to Paris to cultivate literature at the age of 23, but soon went back to the south, and joined the bar at Draguignan, where he acquired a high reputation. In 1791, he was elected a member of the Legislative Assembly; but after the fall of the Girondins, whose opinions he shared, he was thrown into prison, and fortunately forgotten. Released from confinement after the fall of Robespierre, he resumed his profession of advocate, and in the course of five or ten years, acquired a modest competency. He then returned to Paris, and devoted himself anew to literary pursuits. His first poem, *Socrate au Temple d'Aglaure* (Par. 1803), was followed by the tragedies, *Eléonore de Bavière* and *Les Templiers*, the latter of which was brought on the stage in 1805, and met with unbounded success. Two years later, R. was chosen a member of the Academy, of which he became perpetual secretary in 1817. He had been made a member of the imperial legislative body in 1806, and Napoleon, it is said, even meditated appointing him to the presidency, but could not get over R.'s brusque manner and fearless independence of spirit. The principal dramas which he wrote during the *régime* of Napoleon, besides those already mentioned, are *Scipio, Les Etats de Blois, Don Carlos, Charles I., Debora, Jeanne d'Arc à Orleans*. Towards the fall of the Empire, his attention was turned to linguistic studies, particularly to the study of the Provençal language and literature; and his researches into the origin, grammatical rules, and transformations of the Romance tongue, led to many valuable discoveries, though his theories as to the relation of the

language of the troubadours to the other tongues derived from Latin, have been shewn to be erroneous (see ROMANIC LANGUAGES). His chief writings in this department are—*Eléments de la Grammaire Romane* (Par. 1816); *Choix de Poésies Originales des Troubadours* (Par. 6 vols. 1816—1821); *Grammaire comparée des Langues de l'Europe Latine dans leur Rapports avec la Langue des Troubadours* (Par. 1821); *Observations Philologiques sur le Roman du Rou* (Rouen, 1829); *Influence de la Langue Romane* (Par. 1835); and *Lexique Roman, ou Dictionnaire de la Langue des Troubadours* (Paris, 6 vols., 1838—1844). R. died at Passy, near Paris, October 27, 1836.

RAZOR, the sharp-bladed instrument used for shaving the beard, has been in use from very ancient times; it is alluded to by Homer, and shaving was in fashionable use by the Grecks and Romans (see BEARD), as a mark of civilisation. Razors are almost universally metal blades, made exceedingly sharp; but an exception to this is found in some of the razors used by savage nations, as, for instance, the Tahitians, who use pieces of shells and sharks' teeth, upon which they grind very fine edges, sufficiently sharp to remove the beard. The Chinese and Japanese, who shave the head as well as the chin, use razors similar to the European, except that they rarely have handles. The steel of which they are made is of a remarkably fine quality.

The manufacture of razors, in Great Britain, is chiefly carried on in Sheffield, which place also supplies a large export trade. Great care is exercised in choosing the steel for making the blade, but notwithstanding this, there is scarcely an article made by cutlers which is so uncertain in quality when used. Nearly 20 operations are required to produce a razor; nevertheless, such is the perfection to which manufactures are brought by a division of labour, and the application of machinery, that the razors supplied to the British army (at the contract-price of 4½*d.* each) cannot be surpassed for quality.

RAZOR-BILL, or RAZOR-BILLED AUK (*Utamania torda*), a species of Auk (q. v.), also called the Black-billed Auk, very common on the coasts of Britain, and of all the northern parts of the Atlantic Ocean, frequenting lofty precipices, from which its

Razor-Bill (*Utamania torda*).

eggs are taken, with those of guillemots, &c., by persons who are let down by ropes for that purpose. The eggs are esteemed a delicacy; and the flesh of the bird itself is much used for food. Great numbers of razor-bills are annually killed for the sake of their feathers, particularly on the coast of Labrador, where they are extremely abundant. The R. is about 17 inches long, from the extremity of the bill to that of the tail. It is a very fierce bird, and if seized, will lay hold of the hand in return, and submit to be choked ere it will let go. The egg is about three inches long. The bird lays one or two, upon ledges of rock or in fissures.

RAZOR-FISH, or RAZOR-SHELL. See SOLEN.

RAZOR-STROP, an article used for the purpose of sharpening razors. It usually consists of a piece of wood, an inch and a half broad, and 10 or 12 inches long, upon each side of which is glued a piece of leather; one of the pieces of leather is usually dressed with a composition of carbonate of iron and grease, which is used first, and the sharpening is finished on the undressed leather of the other side. A leathern strop is frequently used without fixing on wood. In the West Indies, razor-strops are commonly made of pieces of the wood of *Yucca gloriosa*, *Eriodendron anfractuosum*, *Agava vivipara*, *Ochroma lagopus*, and *Anona palustris*, all of which contain minute deposits of silica in their cellular structure, which render them very efficient for the purpose. Species of *Boletus* are so used in Britain.

RÉ, ILE DE (*Rex insula*), is a small island on the coast of the French department of Charente Inférieure, opposite the city of La Rochelle, from which it is separated by the Pertuis Breton. It is about 18 miles long, and 4 miles broad. It contains 8000 inhabitants, most of whom are engaged in fishing. The island is skirted by high cliffs, and strongly fortified by four forts. It has several good harbours and two light-houses; but there are neither springs nor wood on the island, and next to fishing, the culture of the vine constitutes the chief occupation of the islanders. Brandy made from the wines of Ré, and sea-salt, are the principal articles of the trade of the island. St Martin, which ranks as the capital of Ré, is a well fortified little town with a good harbour, and is the chief seat of the trade. Oyster-farming has of late become an important branch of industry. See OYSTER.

REA'CTION, a term used in reference to the political history of a nation, to designate that tendency, often shewing itself, to recoil from the effects of reform or revolution, and to seek a restoration of the previous state of things, or even of one still more antiquated and despotic. The causes that lead to reaction are various. Sometimes it springs, partly at least, from mere disappointment at the smallness of the *visible* results of those changes advocated with so much eloquence, and waited for with so much enthusiasm and hope. The inconsiderate imagination of the people expects a millennium to follow every important change; and when after the event, men find they are still in the old world of imperfections, hardships, and sorrows, they are prone to believe that they have been deluded, and are only too willing to lend an ear to the insidious misrepresentations of those who are opposed to all progress. But more frequently political reaction springs from immature, or injudicious, or extravagant revolution. The times are not yet ripe (as in the first Italian revolts), or the leaders are unfit (as in the German and Hungarian struggles of 1848—1849), or excesses are committed (as in the great French outbreak of 1789), and so a revolution is nipped in the bud, or overthrown on the battle-field; or, inflamed with sanguinary thirst of revenge, it goes mad in a 'reign of terror,' and exhausting itself in unprofitable frenzies, falls at last an easy prey to any bold and unscrupulous adventurer whom the crowd may elect out of desperation and disgust of anarchy, and whose rule is as absolute as any that preceded it. A reaction may thus, in certain cases, be useful, in so far as

it teaches reformers and revolutionists the point beyond which nature forbids them to go; but its agents are almost invariably base in character, odious in their principles, and selfish in their projects. Religious reactions exhibit the same characteristics as political ones, and proceed from the same causes.

REACTION is the term employed in Medicine and Surgery to indicate the process of recovery from a state of collapse. The subjects Collapse, Reaction, and the general effects of Shock upon the system, are considered in the article on SHOCK.

READE, CHARLES, D.C.L., one of the more distinguished novelists of the day, was born in 1814. He is the youngest son of the late John Reade, Esq., of Ipsden House, Oxfordshire. He received his college education at Oxford, and so distinguished himself as to secure a Fellowship. In 1843, he was called to the bar as a member of Lincoln's Inn; but his legal studies may be presumed to have been merely nominal, and in no long time it became obvious that his chosen career was that of literature. The books by which he first became known as a writer of distinct mark and promise were his *Peg Woffington* and *Christie Johnstone*, both full of talent, though as yet somewhat crude and immature. In 1856, he fairly established his reputation in the novel in 3 vols., *Never too Late to Mend*, by which he is still best known to the general public. Among his subsequent works are a tale in one volume, *The Course of True Love*, remarkable for a rare nicety and subtlety in the delineation of its leading female character; *White Lies* (3 vols. 1858); and *The Cloister and the Hearth*, an elaborate resuscitation of the life of the middle ages; *Very Hard Cash* (1863), *Griffith Gaunt* (1866), and *Put Yourself in his Place* (1870). He is besides the author of several dramas, which have had more or less success on the stage; the most general favourite, perhaps, being that entitled *Masks and Faces*, and conjointly with Boucicault he wrote *Foul Play* in 1868. He has much of the true talent of the *raconteur*, along with considerable dramatic instinct, and from all his later novels, a sense of general intellectual vigour is strongly borne in upon the reader; while a certain wayward crotchetiness and odd aggressive eccentricity from time to time cropping out, serve rather to give to his writing some relish and sting of individuality, than seriously to mar its effect.

READING, a flourishing municipal and parliamentary borough of England, capital of Berkshire, stands on the left bank of the Kennet, 1½ mile above the junction of that river with the Thames, and 36 miles west of London by the Great Western Railway. It is irregular in plan, though recently it has been improved in this respect. The tongue of land immediately above the confluence of the rivers, is the chief business part of the town. The church of St Lawrence, with a tall flint tower, still shews traces of its original Norman character; and the Benedictine Abbey, now a mere shell, was founded in 1121, and was at one time the third in size and wealth in the country. Of the numerous educational establishments, the free grammar-school, to which are attached two fellowships at St John's College, Oxford, and two scholarships, has an endowment of £50 per annum. R. is an important mart for corn and other agricultural produce, carries on manufactures of silks, silk-ribbons, &c., and has extensive iron-works and a large biscuit factory. Pop. (1861) 25,045.

READING, a city of Pennsylvania, U.S., on the left bank of the Schuylkill River, 52 miles north-west from Philadelphia, pleasantly situated on an ascending plain, and supplied by a mountain behind it with streams of pure water. It has regular streets, court house and public offices, several newspapers, blast furnaces, rolling mills, foundries, manufactories of steam-engines and machinery, cottons, woollens, nails, &c., and flour and saw-mills, with a large trade in coal by canal and railway. Pop. 1860, 23,162; 1870, 33,930.

READING AND SPEAKING. Reading is the delivery of language from writing; speaking is the utterance of spontaneous composition. Reading is merely mechanical when words are intelligibly but unimpressively delivered; and it is oratorial in effect when the sentiment proper to the utterance is expressed by pauses, tones, emphasis, &c. Recitation from memory is another form of reading, the matter being delivered from a mental transcript. This mode is highly favourable to oratorical effect, but it is limited in application, and untrustworthy where exactness of phraseology is important. Speaking from spontaneous composition is the highest form of oratory. The qualities requisite for these arts are very different.

To read well involves a perfect understanding of the construction of sentences, and ability to analyse complex forms of composition, and discriminate between essential and expletive words; it also involves a nice perception of the qualities of modulation, and their relation to expressiveness, together with ability to regulate the voice so as exactly to suit the sound to the sense. The study of the art of reading is thus valuable as a means of improvement in composition, as well as for its influence in refining the taste, and exercising all the faculties of perception, expression, and adaptation.

In good reading, the thoughts of the writer must first be taken into the reader's mind, and then delivered as the writer himself might have uttered them immediately on their conception. Children, when set to read language above their comprehension, are of necessity merely mechanical readers; and in this way they acquire habits of unintelligent reading, which are seldom perfectly thrown off in after-life. In silent reading, or the perusal of language for our own information, we gather the sense as we proceed, and correct misapprehensions by reflection; in reading aloud for the information of others, we must perfectly comprehend the matter before we utter it, so as to avoid misleading the hearer. A practised reader can, no doubt, exercise sufficient prevision at the time of reading, by keeping his eye in advance of his utterance, to read any ordinary composition fairly at first sight; but for public reading this would be insufficient. Whatever is to be read in public should first be well studied in private. The reader thus knowing definitely what he has to express, will give forth no uncertain sounds, and his manner will have the freedom of memoriter delivery, without the disadvantage of its constraint upon the mind. His whole attention will be concentrated on the object of his reading, the effective *conveyance* of the matter and spirit of the composition. The presence of the book before him will be necessary chiefly to give confidence, and prevent the possibility of rambling. The eye, assisted by memory, will take in clauses and even sentences at a glance, so that it may be freely raised during utterance. If the eye of a reader is fixed on the book, he seems to be perusing it for his own information; but if he look his hearers in the face, as, with due preparation, he should be able to do, his delivery may have all the qualities of spontaneous oratory, and be to the hearers speaking rather than reading. This effectiveness is rarely exemplified, because the requirements for public reading are so little understood, and so habitually neglected in our systems of education. The

tameness, monotony, and rhythmical singing generally associated with reading, have created a prejudice against the use of 'paper' in pulpit addresses, in consequence of which, in some churches, the practice of reading sermons is discountenanced, while in others it is positively interdicted. The quality of sermons, as compositions, is seriously impaired under such circumstances; but the case for bad reading—against which the prejudice is directed—is *good* reading. All men cannot be orators, but all may be taught to read orthoepically; and were students systematically trained in this art, the services of the church would be rendered far more attractive and influential. In the absence of this training, preachers are the most ineffective of public speakers; and discourses prepared to be delivered from memory are among the meanest species of literary compositions.

The chief points of difference between ordinary reading and the utterance of spontaneous composition, are the uniform force and time, and continuative tones of the former, as contrasted with the reflective breaks and varying modulations and emphases of the latter. The speaker feels what he wishes to say, and he conveys with definiteness the felt relation of each word to the idea which is dominant in his mind. Expletive and explanatory phrases are given parenthetically; ellipses, interpolations between grammatically related words, similes, quotations, and all other elements of rhetorical style, are indicated by changes of modulation; and the *point* of every sentence is made unmistakably apparent. The reader sees all the parts of a sentence level to his eye, and he is apt to deliver them with a corresponding indiscriminativeness of manner; either without variety of time, tone, and stress, or with mere alternation of force and feebleness, or the equal indefiniteness of emphasis on every phrase.

The first requisite for effective reading is a clear conception of the author's intention, together with such a command of the voice as may enable the reader to express that one meaning to the exclusion of all other possible meanings. For every cluster of words is like a many-sided crystal, which may be made to throw light from any of its facets, according as one or another of them is presented uppermost. The most prominent word in the utterance of a sentence is not necessarily the most important grammatical word, but that which is new in reference to the context; and such words as are already before the mind—whether directly stated, inferentially included in former expressions, or otherwise implied—are pronounced with subordinateness of manner. Thus, in the following lines:

> The quality of mercy is not strained,
> It droppeth as the gentle rain from heaven
> Upon the place beneath. It is twice blessed:
> It blesseth him that gives and him that takes.

If the first line were read independently, it would be emphasised as follows:

> The quality of *mercy* | is not *strained*;

but if read in connection with the preceding context, the emphasis would be different. Thus:

> *Portia.* Then must the Jew have mercy.
> *Shylock.* On what compulsion must I? Tell me that.

'Mercy' and the 'compulsion' of mercy being thus already before the mind, the chief point in Portia's reply will now be:

> The quality of mercy *is* not strained,
> It droppeth, &c.

But, as to 'drop' is the natural characteristic of 'rain,' and as rain always falls 'from heaven,' and necessarily 'upon the place beneath,' these implied words will be pronounced subordinately, thus:

> It droppeth as the gentle rain from heaven
> Upon the place beneath.

Bearing in mind, further, that mercy is of heavenly origin, the reader will pronounce:

> It blesseth him that gives and him that takes.

On this principle, the reader shows that he has, in his own mind, performed the author's process of thought, and is made to become conscious of the interpretation which he himself has given. But in order to express with definiteness the thoughts and sentiments thus adopted, the reader must have the instrument of expressiveness perfectly under control. His voice should have no more predisposition to any particular tune than the flute or violin of a musician. Tones have an intellectual value, which is absolute and independent of language, so that emphatic construction may be made to convey interrogative meaning, and interrogative language may have assertive or imperative force. The combinations of the voice unravel all the complexities of composition, separating words from their immediate context, or connecting them with others from which they are most widely separated in the sentence. Thus, in the following lines:

> Slowly and sadly we laid him down,
> From the hill of his fame-crowned glory.

the clause 'from the hill of his fame-crowned glory,' is, by emphatic modulation, shewn to refer to 'him' in the preceding line, and not to the nearer words 'laid' or 'down.' So, also, in the following passage: 'And they came with haste, and found Joseph and Mary, and the babe lying in a manger.' Here the words 'Joseph and Mary [and the babe' is divided by a modulation of the voice, so as to show that the last word 'babe' is alone the grammatical antecedent to the clause 'lying in a manger.' From such illustrations it will be obvious that good reading involves close thinking, and that the governing qualities of tone demand accurate appreciation and careful culture.

The tones of the speaking voice are all more or less *inflected*, in which respect they differ essentially from singing tones, which are level, and only varied in pitch. The term 'modulation,' as understood by elocutionists, has reference to the general pitch of the vocal inflections in a passage. The inflections themselves are all either rising or falling. The rising turn of voice carries on the hearer's attention to what is to *follow*—the falling turn directs attention to what has gone *before*; the former asks, or appeals to the hearer, the latter affirms or enjoins from the speaker; the former is negative—the latter is positive. Simple inflections rise or fall directly from their essential pitch to their termination, and the range of the inflection may have any extent, from less than a semitone to more than an octave. The strongest rising tones are expressive of interrogation, incredulity, or entreaty, and the strongest falling tones of affirmation, assurance, or command. Compound inflections unite the two vocal movements—falling before a rising termination, and rising before a falling termination—with one accented impulse, and the effect of this opposition of tone is to add to the expressiveness of the termination a suggestion or implication in accordance with the expressiveness of the commencing turn. Thus: 'Not one,' with compound rising tone,

implies 'but more.' 'Even ône,' with compound falling tone, implies 'and not more.'

The emphatic force of tones depends on their accentual pitch in relation to that of preceding tones, as well as on the extent and the direction of the inflection. The amount of possible variety in these degrees is exceedingly great, but the peculiar expressiveness of individual modes of inflection is definite, traceable to systematic principles, and of limited extent, depending principally on three qualities—

1. Rising or falling accent as well as termination; as
   Cônstánt, Cònstànt.
2. Rising or falling accent with opposite termination; as
   Cŏnstánt, Cônstànt.
3. Accent higher or lower than preceding pitch; as
   To dîe? To slèep. To slêep? Perchance to drêam.

These three sources of vocal variety the student of elocution should have under ready and perfect control.

The art of elocution has received comparatively little attention in modern times. The value of a good delivery is certainly not less now than it was among the orators of ancient Greece and Rome; but the assiduity with which the art was cultivated by the latter, and the estimation in which it was held by them, present a strong contrast to the negligence and apathy of modern speakers in regard to delivery. This fact is not easily accounted for; the influence of elocution being such, that an inferior address well delivered never fails to create a stronger impression on an audience, than the most masterly composition that lacks the graces and enforcements of effective utterance and action.

The model for effective reading is to be found in the ordinary style of animated conversation. The speaker's tones are not governed by the laws of punctuation, or by formal grammatical periods. Every clause in a sentence is, to the speaker, a period. The most complex sentence is only an aggregation of correlative sentences, each of which is a separate act of thought, and should be delivered as such in reading, as it always is in speaking. Modulation will shew the relation of each part to the whole, but inflection should at the same time shew each part to be in itself complete, as the statement of a distinct though subordinate fact or circumstance.

The rules which some elocutionists have laid down for the reading of sentences, are clearly at variance with this natural principle of intonation, and they lead to an artificiality of manner which is at best a pedantic tune. The formal arrangements of inflections which have been gravely prescribed for 'simple' and 'compound,' 'commencing' and 'concluding' series, 'penultimate' and 'antepenultimate' clauses, &c., have done much to discourage students from paying proper attention to the art of elocution, and have almost justified the denunciations of some authors, who have declared elocution to be altogether unworthy of study. Thus, Archbishop Whately, in his disgust at the jerking alternations of ups and downs prescribed in elocutionary rules, counsels students to have nothing to do with rules, but simply to be 'natural.' To be natural, however, is to follow those laws or principles which undoubtedly are to be deduced from the operations of the voice in spontaneous speaking; and these must be studied by all who would be 'natural' in practising the art of reading. In elocution, as in painting and in every art, the highest attainment of the finished artist is to be natural. Nature and art are not opposites; the former is the *end* of the latter; the latter the *means* to the former. To be natural does not 'come by nature,' but by art; and 'art itself is nature.' Elocution, therefore, is none the less 'natural,' that it must be studied as an art; and the study of this art is not justly to be contemned, whatever condemnation may be due to the errors of elocutionists.

To acquire a natural style of reading, the chief point to be attended to is the logical clausing of sentences, so as to present, with separate completeness to the hearer's mind, every fact and every associated circumstance, whether principal or subordinate. Punctuation is not a sufficient guide for this purpose; it will sometimes even mislead. Thus, in the following sentence from Macaulay's *Essay on Milton:* 'Even when a system has been formed, there is still something to add, to alter, or to reject'—the logic of the sentence is not brought out by the punctuation. The reader should make a modulative break after the word 'something,' where no comma is placed, and he should, notwithstanding the separating commas, unite the three subsequent clauses by a modulative tie, to shew their expletive nature, and the equal relation of each of them to their common antecedent. Thus: 'There is still *something* | to add, to alter, or to reject.'

In the following sentence from the same Essay, no comma occurs, but the reader will nevertheless divide the period into at least three modulative clauses: 'The blaze of truth and liberty | may at first dazzle and bewilder | nations which have become half blind in the house of bondage.' Here the first section contains the *subject* of the sentence, the second the *predicate*, and the third the *object*, with its dependent clauses. It is to be observed that the object 'nations' is separated from its governing verb 'bewilder,' only because the former is itself the governing antecedent to a new but subordinate sentence.

These illustrations are sufficient to shew that the clausing of sentences for effective reading is dependent on a different principle from that which regulates punctuation.

Nor is any particular mode of vocal inflection necessarily associated with any of the marks of punctuation. This is particularly to be noted in connection with the sign of interrogation. The position of this mark, too, at the end of a period often misleads readers into an unnatural tone. The interrogative part of the sentence may not extend beyond a single clause, and this may be followed by many clauses within the same period. The mark of interrogation would therefore be better placed at the beginning of a sentence. But, as above shewn, interrogative language may sometimes require for its just expression any one of all the tones in the gamut of speech. Thus: 'Wíll you?' If pronounced with a simple rising tone, this question asks or appeals; and with an extended range of inflection, it expresses doubt or surprise. But the form of words does not necessitate the rising tone. Thus: 'Will you?' If pronounced with a simple falling turn, the question expresses desire or expectation on the part of the speaker; and with an extended range of inflection, it conveys more or less of authoritative injunction.

The same question may legitimately, also, take either of the compound forms of inflection. Thus: 'Wíll you?' If pronounced with a compound rising turn, it infers some cause of opposition or hindrance; and with an extended range of inflection, insinuates more or less of threatening or penalty. With a compound falling tone, thus: 'Will you?' it suggests more or less of defiance and contempt,

according to the pitch of the commencing turn, and the extent of the concluding inflection.

The principles of vocal expression, circular pronunciation, emphasis, &c., as above sketched, apply equally to speaking as to reading; but it is in connection with the latter chiefly that they require to be studied, as they are generally applied instinctively in spontaneous speaking, even by those who are most enslaved by vicious habits in reading. The management of the voice, however, should be more than an instinct to the orator; and there is much in the philosophy of vocal expression that will be studied with equal advantage by both speakers and readers.

Extemporaneous speaking is greatly assisted by a good habit of elocution, and it is at the same time strongly conducive to the formation of such a habit. The deliberate utterance which weighs every phrase, gives the mind time to revolve its ideas, and choose the most effective words for their expression; and the evolution of a continuous train of thinking in coherent sentences compels deliberation and guarded delivery. But while the grandest triumphs of oratory are thus to be achieved, the requisites for success are such that great orators must ever be few in number. The ancient rhetoricians describe their model speaker as one who is accomplished in all knowledge, and esteemed for every virtue, and who has devoted more than the average duration of human life to laborious preparation; for they held that the oratorical faculty could not attain its full development and influence until hoary hairs had added the venerableness of age to a reputation for learning, sagacity, and unimpeachable morality.

Speaking from memory admits of the application of every possible element of effectiveness, rhetorical and elocutionary; and in the delivery of a few great actors, the highest excellence in this art has been exemplified. But speaking from memory requires the most minute and careful study, as well as high elocutionary ability, to guard the speaker against a merely mechanical fluency and thoughtlessly rhythmical utterance. This mode of delivery is therefore only appropriate to special efforts, for which due preparation can be made. Otherwise, memoriter delivery—as of sermons composed and learned at the rate of one or two every week—is altogether incompatible with excellence either of matter or of manner.

That the art of reading, which is on all accounts worthy of the highest position among the exercises of students for the oratorical professions, should be so utterly neglected in our systems of education, is a reproach to the enlightenment of our age; and it is especially a scandal to our universities, in which the examples of the famous orators of antiquity, and the lessons of their experience, are so fully known, yet practically dishonoured.

REAL is a phrase much used in the law of the United Kingdom in combination with various other terms. In the law of England and Ireland, real property or real estate, or realty, constitutes one of the great subdivisions of all property, consisting of what is popularly known as land and houses, which are not legal terms; personal property, or personalty, includes all the other kinds of property, as goods and chattels, money, &c. The same or a similar distinction pervades the laws of all countries. In the Roman law, things were divided into movable and immovable. In the law of Scotland, the division is into heritable and movable. The division into realty and personalty comes into operation in the event of the death of an owner of property, especially when he dies intestate, in which case his realty goes to the heir-at-law, and the personalty to

REAL, a silver coin and money of account in use in Spain, Mexico, and other old Spanish possessions. In Spain, it is the 20th part of the gold *peso duro*, is equivalent to 34 maravedis (an imaginary copper coin), and varies with the rate of exchange, from 2½d. to 3d. sterling. Of the old Spanish reals now disused, the *real de plata* was the 4th of the piastre or *peso duro* (see PIASTRE), and the copper-real or *real de vellon*, was the 34th part of the piastre. The real was first coined in Spain in 1497, and has since that time frequently varied in value. At the present day, in Mexico, Peru, and the Central American Republics, the piastre is divided into 8 reals, and silver coins of one real are current, while in New Granada, it is divided into 10 reals, and silver reals and half reals are coined. The real is also a money of account in Portugal, being the equivalent of 40 reis; and in Estova, it is the name of a weight for gold and silver articles corresponding to 17 dwts. 14 grains troy weight.

REALGAR, a mineral consisting of about 70 parts of arsenic and 30 of sulphur. This native sulphuret of arsenic is of a very brilliant scarlet colour, generally translucent, but sometimes transparent; and occurs in the vicinity of volcanoes, and in many igneous rocks; massive, disseminated, or crystallized. Its crystals are prisms, sometimes needle-like. It yields to the pressure of the nail.

REALISM. See NOMINALISM.

REAL PRESENCE in the Eucharist, a doctrine forming an article in the belief of the Roman, the Greek, and other Eastern churches, and of some bodies or individuals in other Christian communities, according to which it is held that, under the appearance of the Eucharistic bread and wine, after consecration by the priest, Christ himself is really and substantially present, body and blood, soul and divinity. The word *really* is used in opposition to 'figuratively;' and the decree of the Council of Trent, which is the authoritative expositor of the Roman Catholic belief, couples with that word the terms 'truly' and 'substantially,' the former being used in order to exclude the notion of a barely figurative representation, such as is recognisable in the Paschal Lamb and the other Messianic types of the Old Law; and the latter for the purpose of meeting the view ascribed to Calvin, that Christ, as apprehended by the faith of the believer, was, for such believing,

rendered virtually present in the Eucharist, and that his body and blood were received in virtue and efficacy, although not in corporeal substance. The belief of the Roman and Eastern churches as to the reality of the presence, was shared by Luther, who, however, differed from Catholics as to the mode; and has always been followed also by one school of divines in the Anglican Church, whose doctrine became very prominent in the time of Laud, and has been revived in the late Tractarian movement. But between Catholics and all the non-Catholic schools of whatever class, one marked difference exists. According to the former, the presence of Christ in the consecrated Eucharist is *permanent;* so that He is believed to be present not alone for the communicant who receives the Eucharist during the time of his communion, but also remains present in the consecrated hosts reserved after communion. On the contrary, all the Lutherans, and almost all Anglicans, confine their belief of the presence to the time of communion, and all, with hardly an exception, repudiate the worship of the reserved elements, as it is practised by Catholics.

The question as to the *reality* of Christ's *presence* in the Eucharist is quite distinct from that which regards the *mode* of the presence, for which see TRANSUBSTANTIATION.

REAM, a certain quantity of paper, consisting of 20 quires, each quire containing 24 folio sheets. A *printer's ream* should consist of 21½ quires. The word appears to be derived from the Saxon *ream*, a band, and was probably applied in consequence of the bundle of paper being held together by a band.

REAPING, the act of cutting corn, has been performed from time immemorial with an instrument called a reaping-hook or sickle. The sickles in use among the ancient Jews, Egyptians, and Chinese appear to have differed very little in form from those employed in Great Britain at the present day. The reaping-hook is a curved instrument of about a foot and a half in length, tapering from a breadth of about two inches at the but-end, where it is fixed into a wooden handle. The edge is sometimes serrated, but, as a rule, it is now made plain and sharp like a knife. In reaping, the harvester takes the corn in his left hand, and then with the hook cuts the stalks as close to the ground as possible; but when a grass crop has been sown down with the grain, it is thought judicious to leave the stubble of greater length, in order to preserve the young grass. The corn is placed handful by handful in a band usually made of the corn, and when as much has been cut as will form a sheaf, it is tied up by the 'bandster.' The most expert reapers slash down the corn with the hook in the right hand, using the left merely to keep the corn from falling, until sufficient to make a sheaf has been cut, when the reaper places his hook under the corn, and supporting it with his left arm, deposits it all at once in the band. The middle person on the ridge usually makes bands for other two reapers; and a bandster (one to every *three* or *four* reapers) binds the grain, and sets it up in shocks or stooks of 8—12 sheaves.

In the principal corn-growing districts of Scotland, a great proportion of the reaping by hand is done by labourers from Ireland, who, of late years, frequently take the work at from 8*s*. to 15*s*. per acre, with board and lodging in addition. Their fare is of the simplest kind—consisting, in the majority of cases, of porridge morning and evening, and bread and beer for dinner; their lodging at night is the barn or some outhouse, the farmer providing coarse blankets for covering. The quantity of porridge consumed at each meal by these people is sometimes astonishing—no less, as has been proved by actual weighing, than 5 lbs., with 1½ lb. of milk besides. Frequently these reapers are engaged at so much per week, with food. In England, most of the corn is cut by piece-work, at prices varying from 10*s*. to 18*s*. per acre. On the stronger lands of the midland and southern counties the stubble is often left knee-high, and afterwards at leisure cut by the scythe, or with a long hook, at a cost of 2*s*. per acre. In Yorkshire, Derbyshire, Oxfordshire, and on many of the lighter soils in other counties, the operation of fagging or hacking, to be afterwards noticed, is preferred as being more expeditious than reaping. A good hand will get down from one-third to one-half of an acre of wheat, and will often consume during his long day's labour, two gallons of good ale.

The scythe, in some counties, is preferred to the sickle. The most common varieties are: the Hainault scythe—an importation from Belgium—the cradle scythe, and the common scythe fitted with a cradle. The Hainault scythe consists of a blade about 2 feet 3 inches long, having a handle 14 inches long. This the mower holds in his right hand, while in his left he carries a hook, with a handle of about equal length. 'The reaping,' says Mr Henry Stephens, in his *Book of the Farm*, 'is done by pressing the back of the hook with the left hand against the standing corn, in the direction of the wind, and by cutting with the scythe close to the ground against the standing corn with a free swing of the right arm,' the hook keeping the cut corn from falling until a sufficient quantity to form a sheaf has been cut. This operation is practised in many parts of England, and especially on the lighter soils, under the name of fagging or hacking, the reaper sometimes using in his left hand, instead of the hook, a stout crooked stick from 2½ to 3 feet long. Beans and oats are the crops most generally fagged. The cradle scythe is composed of a blade about 3½ feet long, attached to a principal helve or sned about 4 feet long, into which another helve of about 3 feet in length is tenoned, thus making two handles. The cradle or bow is a piece of wood jointed to the heel of the blade, into which are inserted three or four wooden teeth, in a line with the blade, the object of which is to secure the grain being laid evenly in one direction. By the scythe, corn can be cut at a less cost per acre than with the hook; but in some quarters there is an opinion that the work is not so neatly done. In the midland and southern counties of England, the scythe in general use is of larger size, and has only one long handle. With it most of the oats and barley are cut, and in some localities these crops are left unbound in the swath like hay, and, after a few days, turned over, placed in cocks, and carted home loose. In Bedfordshire, Hertfordshire, and some of the eastern counties, the whole of the cutting, until the introduction of reaping-machines, was done by these scythes; and on many of the larger farms, the workmen undertook the whole of harvest operations, from the cutting of the crop to the thatching of the ricks, at prices varying from 18*s*. to 25*s*. per acre.

The process of reaping with either the sickle or the scythe is, however, both tedious and expensive; and hence, during the last three-quarters of a century, many attempts have been made to accomplish the work by machinery—attempts which, in the course of the last ten years, have been crowned with complete success. Reaping by machinery, however, is no modern invention. Pliny the Elder, who was born early in the 1st c. of the Christian era, found a reaping-machine in Gaul. He says: 'In the extensive fields in the lowlands of

Gaul, vans of large size, with projecting teeth on the edge, are driven on two wheels through the standing corn by an ox yoked in a reverse position. In this manner the ears are torn off, and fall into the van.' Palladius, about four centuries later, found a similar appliance for reaping corn in Gaul. He gives a more detailed but similar description of the machine. The annexed cut, copied from Mr

Fig. 1.—Ancient Reaping-machine.

Woodcroft's *Appendix to the Specifications of English Patents for Reaping-machines*, represents what is conceived, from the descriptions, to have been the form of this ancient reaper.

It is a curious fact, that a machine of somewhat similar construction for cutting off the heads of the grain is now in use in Australia, where straw is still of comparatively little value. The Australian machine, however, thrashes and winnows the grain at the same time.

In modern times, the idea of a mechanical reaper appears to have originated with a Mr Capel Lloft, who, in 1785, suggested a machine something after the pattern of the ancient one above described. Between that time and the Great Exhibition of 1851 in London, from which the general use of mechanical reapers may be said to date, the patents taken out for reaping-machines were very numerous. Among the most promising of these may be mentioned those of Mr Gladstone of Castle-Douglas; Mr Smith of Deanston; Mr Kerr, Edinburgh; Mr Scott of Ormiston; Mr Dobbs, an actor in Birmingham; Mr Mann of Raby, near Wigton; and the Rev. Patrick Bell of Carmylie, Scotland. In 1826, Mr Bell constructed an efficient and simple machine, which still continues in use during every harvest. This machine is propelled through the corn by horses yoked behind it; the knives or shears are on the reciprocating principle, and the corn is laid down in swaths by means of an endless web. In America, Mr Hussey and Mr M'Cormick took out patents for reaping-machines of superior character in 1833 and 1834 respectively.

The movements of the cutters of these machines were various. A few were advancing only, some sidelong and advancing, others reciprocating and advancing, a large number continuous and advancing, and others continuous and alternate. The reciprocating and advancing motion is that now employed on all the machines in use. The principal difference in the machines now so largely used for cutting corn is in the form and character of the cutters, in the mode of delivering the grain after it is cut, and in the manner of draught or propulsion.

The cutting-knives are of two kinds—one, obtuse-angled and serrated; the other, acute-angled and for the most part plain. Both are attached to a bar, and are made to work through another bar of iron fitted with hollow fingers, called guard-fingers, which, projecting forwards, catch the standing corn, and retain it firmly until it is cut. The serrated knife saws through it; the plain knife clips it, as it were; the finger-guard forming the fixed blade of the scissors. In the case of the serrated obtuse-angled knife, a reel or a rake, either moved mechanically or by manual power, is necessary to bring down the corn to the cutter. With the plain knife, this is not so much needed, and it has not grown of late, which the other cannot do without. For the obtuse-angled knife requiring less sharpening, is not so liable to choke, and takes rather less power to drive.

The delivery of the sheaves is effected either by manual or mechanical labour, but the vast proportion of the machines in use are what are termed manual delivery reapers. The delivery of the sheaves can be accomplished in two ways—either at the side or at the back of the machine. But the side delivery, by manual labour, has been found difficult in practice, and therefore has been almost quite abandoned. In delivering the grain a man, with a short-handled rake in his hand, follows the machine behind the cutting apparatus. With this he inclines the grain towards the cutter; and when sufficient to make a sheaf has been cut, he takes it off the platform upon the machine, on to which it has fallen, and deposits it on the ground. The cut subjoined will illustrate the method of raking off. In making a neat and squarely formed sheaf, the raker is greatly assisted by a hinge in the

Fig. 2.—Hussey's Reaping-machine (cutting part).

platform, which enables him, by pressure of the foot, to tip the board over, so as to let the corn slide gently down. The disadvantage of a back-delivery is, that the sheaves must be taken up and removed out of the way of the machine before it comes round again. Such a reaper, therefore, always requires a full supply of hands to attend upon it, while a side-delivery might work for a whole day without more persons than the driver and the raker.

The mechanical or self-delivery machines, as they are generally called, are of two kinds—one lays the cut corn in swaths, the other deposits it in sheaves. There are several arrangements for laying it in swaths by an endless web of cloth, or by endless bands, which have now almost superseded the web, and by Archimedean screws. Web, bands, and screws all lay off the corn to the side, so that a whole field may be cut without the necessity of lifting the grain out of the track of the horses. Bell's improved machines, and Burgess and Key's M'Cormick's, are the most approved swath-delivery-machines.

The automaton sheaf-deliverers best known to the public are those of Samuelson of Banbury and M'Cormick. There have been others advertised, but as yet they have not been sufficiently tried to secure the entire confidence of farmers. As Mr Samuelson's sheaf-deliverer has been more largely patronised in Great Britain than any other machine of its class, we give first a description of it, which will be made plain by the accompanying cut. The self-delivering machinery consists of a series of four

rakes—two toothed, and two plain—attached to an upright shaft, in such a manner as to admit of a free ascending, descending, and horizontal motion.

Fig. 3.—Samuelson's Self-delivery Reaping-machine.

The two toothless rakes, or 'dummies,' are shorter in the arms by six inches than the other two, and are merely employed to incline the grain towards the cutter. Upon the upright shaft, to which the rake-arms are attached, is a disc-wheel, placed horizontally, which is put in motion by another placed vertically, and deriving its motion from a pitch-chain in connection with the driving-wheel. The platform upon which the grain falls after it is cut is of quadrant shape, and is surrounded, on the outer edge, by a rim of about a foot deep. To insure the rakes passing over the platform on the level, and not obliquely, as their angular attachment to the upright shaft would imply, a nearly circular iron hoop, from three to four feet in diameter, passes round the upright shaft, upon which, as a *cam*, small iron rollers, fixed upon the under-side of the shafts of the rakes, revolve. The side of the *cam* next the platform is bent or depressed, so that the rakes, on reaching this point, make a sudden fall, or eccentric motion, thus assuming the horizontal attitude necessary to sweep over the platform on the level. The rakes are adjusted so as to lay the sheaves about 12 feet apart, to the side, and out of the way of the horses. This machine has a double-throw knife—an arrangement which reduces the driving speed, and consequently the wear and tear of the machinery; and there is an ingenious contrivance for raising and lowering the knife as occasion requires.

In M'Cormick's automatic delivery-machine, a rake is so used that 'during one part of the revolution of the gathering-reel, it acts as one of the vanes of the reel in bending the standing corn to the cutting-blades. When the rake reaches the cutting-blades in front of the platform, it ceases to revolve around the reel-shaft (which continues its rotary motion), and is made to move horizontally upon a vertical hinge, to which one end is attached (the points of the teeth being near the surface of the platform), sweeping the cut corn off at the side, and depositing it on the ground in sheaves ready for the binder. Motion is then given to the rake, causing it to rotate round the shaft of the reel; and it is brought into line with the reel-shaft at that part of its revolution when it again begins to act as one of the vanes of the reel. The mechanism by which these operations are controlled is composed of a roller, guided by an eccentric or *cam* and the necessary parts to attach the rake.'

Both these machines leave the stubble clean, and lay off the sheaves squarely; but the continuous motion in Samuelson's appears to render it less liable to breakage than the other. The price of each is about £34 or £35.

We have particularised these machines, because they supply that which is the great desideratum in reapers—a ready-made sheaf; but it would be invidious to single out names from among the manufacturers of manual delivery-reapers, as almost all these machines do the mere cutting remarkably well. The prices of these run from £16, 16*s.* to £25. It is impossible to give the number, or even an approximation to the number of reaping-machines now in use; but most farmers having a large extent of suitable land have one or two, and some even as many as four and five. One English maker annually turns out upwards of 1000.

All the machines are on the side-draught principle, save Bell's, which is propelled by direct power from behind. This machine possesses an advantage over all the others, in so far as it can commence operations in a field of grain without having a path cut for it.

The cost of reaping by machinery is much less than either by scythe or sickle. Mr Wilson of Woodhorn, Morpeth, found that the cutting of wheat with the sickle (binding and stooking included) cost him from 11*s.* to 15*s.* per acre, and with the scythe 8*s.*, whilst with the machine it only cost him 5*s.* 9*d.*, exclusive of wear and tear. From data supplied by a large number of their customers, Messrs Samuelson & Co. make out that the saving by mechanical over hand labour is, as compared with reaping, 4*s.* per acre, and with mowing, 1*s.* 9*d.* per acre; and most farmers who have tried reaping-machines set down the saving at from 30 to 40 per cent. Besides, there is about a like economy in time, which is of immense importance in a variable climate like that of Great Britain.—See Woodcroft's *Appendix to Patents for Reaping-machines; Book of Farm Implements*, and *Book of the Farm*, by Henry Stephens; J. C. Morton's *Cyclopædia of Agriculture;* J. J. Thomas, *Farm Implements and the Principles of their Construction*, New York, 1854.

REASON, REASONING. The word Reason denotes that function of our Intelligence having reference to the attainment of a particular class of truths. We know a great many things by immediate or actual experience. Our senses tell us that we are thirsty, that we hear a sound, that we are affected by light. These facts are truths of Sense, or of immediate knowledge, and do not involve the reason. Reason comes into play when we know a thing not immediately, but by some indirect process; as when, from seeing a river unusually swollen, we believe that there have been heavy rains at its sources. Here the mere sense tells us only that the river is high; it is by certain transitions of thought, or by the employment of our thinking powers, that we come to know the other circumstance, that in a remote part of the country there have been heavy rains.

In ascertaining these truths of reason, or of Inference, as they are called, there are various steps or operations, described under different names. Thus we have (1), Deduction, or Syllogism; (2), Induction; and (3), Generalisation of Notions, of which Abstraction and Definition are various phases. These are described under their several designations. The nature of the function or faculty denominated Reason or the Reasoning Faculty, can be explained by shewing how it results from the fundamental powers of the Intelligence. See Association of Ideas.

There is another and peculiar signification attached to the word Reason, growing out of the philosophy of Kant. He maintained the existence

of certain principles or cognitions *à priori*, or of intuitive origin, and not derived from experience, such as cause and effect, the axioms of mathematics, &c. See COMMON SENSE. It was a function of the Reason, according to him, to recognise these principles; while the generalisations of mere experience, as that water extinguishes fire, were proved by the Understanding. Other philosophers give the name 'Noetic faculty' (Greek, *noos*) to the same function. Hamilton calls it the 'Regulative faculty.'

RÉAUMUR, RENÉ ANTOINE FERCHAULT DE, a celebrated naturalist and physicist, was born at La Rochelle, in the department of Charente-Inférieure, France, 28th February 1683; and studied in the Jesuits' College at Poitiers, and afterwards at Bourges. With an eye observant of facts of every kind, and an indiscriminate thirst for information, he yet specially devoted his attention to physics, natural history, and mathematics. In 1703, he went to reside at Paris, where he speedily attracted general attention by the publication of three geometrical Memoirs on particular cases of the intersection of lines; and in 1708, he was elected a member of the Academy of Sciences, and was charged with the supervision of the work *Description des divers Arts et Métiers*, published under the auspices of the government. R. lightened his labours with occasional researches into various subjects of natural history. These researches occupied him from 1708 to 1715, and were followed by a series of investigations into the condition of the woods, gold-bearing rivers, and turquoise mines of France. His investigations into the nature of the turquoises of Languedoc led him to the discovery, that they consisted of the fossil teeth of extinct animals. The collections of Memoirs of the Academy of Sciences from 1722 till 1725 contain a number of papers by R., in which he details his discoveries of the mode of producing steel from iron (an art till that time unknown in France), of the tendency which fused metals have to become crystallised, and of the mode of tinning iron (also till that time unknown in France). For these brilliant and valuable successes, he received from the French government a sum of 12,000 livres, which he spent in promoting and encouraging the industrial arts in his native country. R.'s volatile genius next prompted him to take up the subject of pottery; and here also his ingenuity and perseverance were rewarded with success, for though he failed in successfully imitating the porcelain of China, he succeeded in producing (1739) an opaque glass, which was equal to the porcelain of Saxony and Japan. All this time, he occasionally pursued his studies in natural history, at one time propounding a mode for preserving eggs (by coating them with fat), at another giving directions for the production of fowls by artificial incubation. His invention of the *Thermometer* (q. v.) which bears his name need not be more than mentioned here. He died of a fall from a horse at his estate of Bermondière, in the department of Maine, 17th October 1757, leaving behind him a voluminous collection of works on all the subjects above stated, also a treatise on 'the silk of spiders,' which was translated into Manchu by the command of the Emperor of China; and a number of Memoirs (1731—1740), containing his thermometric researches on air, and on mixtures of fluids with fluids or solids. But by far his most important work is the *Mémoires pour servir à l'Histoire des Insectes* (Amsterdam, 12 vols. 1737—1748), which embodies a number of original observations and discoveries concerning the habits and instincts of insects, sufficient of itself to immortalise their author. Only six volumes of this work have been published, the seventh being very incomplete at the period of the author's death. While collecting materials for this great work, he kept numerous insects of all kinds in his garden in order to have every opportunity for observing them. The Academy of Sciences obtained, by the terms of R.'s will, his collections of animals and plants, materials for a History of Quadrupeds and Birds, afterwards made use of by Buffon and Daubenton, a History of Mice, to the number of nearly a hundred and sixty-four species.

REBATE, a longitudinal groove, cut in a piece of timber, to receive the edge of another piece, or the ends of a number of pieces of wood. A rebate,

Rebate.

such as that in a door standard for the door, as in the fig., is also called a rabbet. In Masonry, such a joint is called a *joggle*.

REBATED, in Heraldry, having the point broken off or cut short.

REBEC (commonly *rebeck*, or *rebeck*, Arabic, *rebab*), an ancient musical instrument of the violin kind, of which the body, instead of consisting of two hemispherical enlargements, like other instruments of the same tribe, was narrow towards the neck, and gradually enlarged till it rounded off at the lower end. It had a body and three strings tuned in fifths, and was played with a bow. The earliest known representation of the rebec, however, taken by the Abbé Gerbert from a MS. of the 9th c., gives it but one string. The Moors introduced this instrument from the East into Spain, whence it spread over the rest of Europe, and was the precursor of the violin. The four classes of rebecs, treble, alto, tenor, and bass, were favourite instruments of the minstrels of the middle ages and were used both for the dance and to accompany part-singing. Milton, in his *L'Allegro*, characterises this instrument as the 'jocund rebec.'

REBELLION (Lat. *rebellio*, from *bellum*, war, a revolt by nations subdued in war; an openly avowed renunciation of the authority of the government to which one owes allegiance, or a levying of war to resist the authority of the government. Unlike insurrection, which may be merely in opposition to a particular law, rebellion involves a design to renounce all subjection to the state. *A commission of rebellion* is a commission awarded against a person who treats the sovereign's authority with contempt, by not obeying his proclamation according to his allegiance, and refusing to attend his sovereign when required. It consists of four commissioners, who are ordered to attack the rebel wherever found. In Scotland, by a legal fiction, a debtor disobeying a charge on letters of horning to pay or perform in terms of his obligation, was accounted a rebel, as being disobedient to the sovereign's command contained in the writ. This disobedience was called civil rebellion, and the penal consequences of actual rebellion followed it, until they were abolished by 20 Geo. II. c. 50. By the old form of diligence (which is still competent), it has therefore been said that debtors were imprisoned not for debt but for rebellion. This fiction was discarded in the provisions of the statute 1 and 2 Vict. c. 114, supplying the form of diligence and the steps by which imprisonment for debt is effected.

The expression 'The Great Rebellion,' is generally applied in England to the revolt of the

Long Parliament against the authority of Charles I. It began with the votes of the two Houses regarding the militia in 1642, by which they endeavoured to seize the military power of the country, and the departure of the king for York, which was immediately followed by the breaking out of hostilities. The civil war was, properly speaking, terminated by the submission of Charles to the Scots, in April 1646; but the period of the rebellion is usually held to include the Commonwealth or Protectorate, and to extend to the restoration of Charles II. in May 1660.

The revolts in behalf of the House of Stuart in 1715 and 1745 are often, particularly in Scotland, spoken of emphatically as 'The Rebellion.' The former rising in favour of the Chevalier de St George, son of James II. of England, called the Old Pretender, was headed by the Earl of Mar, and put down in 1716: the latter was led by Prince Charles Edward, known as the Young Pretender, who, landing in the Hebrides, was joined by the Highland chieftains and numerous followers, and after taking possession of Edinburgh, and marching to Derby, retreated into Scotland, and was defeated with great slaughter by the Duke of Cumberland at Culloden, on the 16th of April 1746.

RE'BUS, an enigmatical representation of a name or thing by using pictorial devices for letters, syllables, or parts of words. The term probably originates from the device speaking to the beholder *non verbis sed rebus*. Devices of this kind, allusive to the bearer's name, were exceedingly common in the middle ages, particularly in England. In many instances, they were used by ecclesiastics and others who had not a right to armorial ensigns. Thus, on the rector's lodgings at Lincoln College, Oxford, erected in the 15th c., to which Thomas Beckyngton, Bishop of Bath and Wells, liberally contributed, is carved the rebus of that prelate—a beacon and tun, with *T*, the initial letter of his Christian name. In Westminster Abbey, Abbot Islip's chapel gives two forms of his rebus—one, a human eye, and a small branch or slip of a tree; the other, a man in the act of falling from a tree, and exclaiming, 'I slip!' Many of the monograms of the artists of the middle ages and early printers were rebuses. That of Ludger von Ring was the letter *L* inserted into a ring. A large proportion of the early coats of arms were rebuses on the names of the bearer of them, as, for example, three salmons for the name of Salmon, a lock and heart for that of Lockhart, three skenes or dirks for Skene. Family badges are also frequently of the nature of a rebus, and mottoes, as *Ver non semper viret* of the Vernons.

RÉCAMIER, Jeanne Françoise Julie Adelaide Bernard, Dame, perhaps the finest representative specimen, in later times, of that character peculiarly French, the 'woman of society,' the potentate in petticoats, who sways the *salon*, and out of it becomes in doing so a sort of 'unacknowledged legislator'—was born at Lyon in December 1777. Her father was a banker of that city, and, as well as her mother, was distinguished by much of the personal grace and charm which, in the daughter, seem to have culminated, as it were, in a form of almost typical perfection. She was beautiful, and in rare measure possessed, as the soul of her beauty, the woman's indefinable fascination, the *je ne sais quoi* of her country. She was educated under the charge of an aunt in the convent of La Déserte; and at about the age of 15, she went to Paris to join her parents, who had some time before migrated thither. Shortly after, she was married to M. Jacques Récamier, a rich banker about thrice her own age. The union is said to have been scarcely in the ordinary sense connubial ('M. Récamier n'eut jamais que des rapports paternels avec sa femme'); but a mutual affection and respect informed it from the first, and consecrated it to the end, as passion might possibly have failed to do. A record of the splendid social triumphs of Madame R. would involve notice of nearly all that was distinguished in Paris during a space of about fifty years. In that strange, impalpable, yet most real way, of which, in this country, we can have only a faint and also coarse conception, she became a power, and she continued so; and this despite changes of fortune, which, among *us*, would have involved the extinction of even a more solid celebrity. To the famous Madame de Staël, she was bound by ties of extreme affection and intimacy; and when her friend was banished from Paris, as having drawn on her the little jealousy of Napoleon, she lavished her sympathy on the brilliant exile. Some time after, the complete ruin of her husband's fortunes induced her to accept an invitation from Madame de Staël to join her at Coppet in Switzerland (1806). Here she was thrown into the society of Prince August of Prussia, and a mutual attachment ensued. It is supposed that, of all her innumerable admirers, he alone succeeded in touching her heart. A marriage was arranged, the necessary condition of which was the consent of M. Récamier to a divorce. This was not refused; but his mild and touching remonstrance sufficed to divert from her purpose a woman, on the one hand, of generous and noble feeling, and probably, on the other, constitutionally incapable of any very vehement passion. The man whose brilliant prosperities she had shared, she shrunk from deserting in the decay of fortune which had by this time befallen him. The devotion of her princely lover continued till his death in 1845; but it does not appear that after his first distinct failure—though he frequently again met his beloved—his efforts to secure her were very vigorously renewed. The lady's genius for love does not seem to have been great; but for friendship, it was almost unexampled. The most distinguished *ami* of her later years was M. de Chateaubriand, who solaced himself in his peevish decline by an almost daily visit to her. In 1846, he became a widower, and he then wished to marry Madame R., a widow since 1830; but the lady declined the honour—wisely for herself and for M. de Chateaubriand. Till the last day of Chateaubriand's life, he found—though his hand had been refused by her—in the friendship of Madame R., almost his only source of cheer and satisfaction. Chateaubriand died July 4, 1848, and Madame R. followed him on the 11th May 1849. She died not so much of grief as of cholera, a disease of which her dread had always been great; and dying, she left behind her a reputation which must continue to give her a historic place among the French Queens of Society. If not quite so brilliant as some of them, she was obviously much more correct than most, on a ground of virtue or of coldness. Specially brilliant she was not; but she seems to have moved in some atmosphere breathed about her of bewildering charm and fascination. Passion, in its fiercer sense, she had not in herself, nor does she seem much to have inspired it; but the genius of refined *philandering*, as it is termed, was probably never more exquisitely embodied. See *Souvenirs et Correspondance tirés des Papiers de Mme Récamier* (Par. 1859).

RECEI'PT is the technical as well as popular term signifying a legal acknowledgment of money received in discharge of a debt or demand. It is often popularly believed that a written receipt is the only legal proof of payment; but this is a mistake, the fact being that it is only one mode of proving

it. If the money be paid in presence of witnesses, or even without witnesses, provided a jury or judge believe the statement on oath of the party paying it, this is, in England, quite as good evidence of the payment as if a written receipt were given; and even a written receipt is not conclusive, for it is subject to explanation, and if it was obtained in advance of a payment which never followed, or by fraud, it goes for nothing as a discharge of the debtor. If a receipt is in writing, and the sum paid exceeds 40s., it must be stamped with a penny receipt stamp (which may be an adhesive stamp), otherwise the receipt is inadmissible as evidence of payment. Not only is a receipt proper subject to stamp duty, but also any note or memorandum given to a person on payment of money, and acknowledging payment of any part of a debt or demand, whether signed or not; so receipts given on payment of bills of exchange or promissory-notes, are liable to stamp-duty. But there are several exceptions from liability to stamp-duty. Such are receipts for deposits with bankers (except when paid on allotment of shares, or in respect of calls on shares); receipts as to the assessed taxes for land tax, income-tax, and payments to the crown; receipts by officers, seamen, marines, or soldiers for wages or pay; receipts for purchase of government stock; receipts written on the back of duly stamped bills of exchange or promissory-notes, or upon the back of duly stamped purchase-deeds. Where a debtor tenders money, but requires a stamped receipt at the same time, he ought to provide himself with paper, and stamp, and writing materials, for the creditor is not bound to supply these. In Scotland, the receipt of money cannot be proved by witnesses, where the debt was created by writing, and it is not allowed to dispute the validity of a written receipt, except in cases of fraud.

RECEIVING STOLEN GOODS is a criminal offence, distinct from larceny. It implies that the goods were received with the knowledge that they were stolen. The offence is felony, and punishable with penal servitude from 3 to 14 years; or 2 years' imprisonment, with or without hard labour. In cases where the stealing is only a misdemeanour, then the receiving is also only a misdemeanour; and where the taking of property is an offence punishable on summary conviction, the receiving with knowledge is punishable in the same way. It is sometimes extremely difficult to distinguish between the case of a receiver and of one who is a party to the stealing, or a principal. The thief may be a witness against the receiver.

RECENT or HUMAN PERIOD, in Geology, is the title given to the epoch that has elapsed since man made his appearance on the globe. The causes that operated throughout the ages of geological time to produce the changes recorded in the various sedimentary deposits, did not terminate with the beginning of human history, but have been ever acting since man was able to observe and to record his observations, and are still in progress around us. The solid earth is being washed away by atmospheric agency, and the abraded portions are continually carried away slowly and imperceptibly by streams and rivers, to form new deposits in the depths of inland lakes or of the ocean. Volcanoes are throwing up lava and scoriæ, and earthquakes are elevating portions of the earth's surface in one place, and depressing them in another; and plants and animals are, either with their living bodies or their dead exuviæ, forming, as in past ages, deposits in various places, as in the foraminiferous ooze of the deep ocean, and the enormous coral reefs of the eastern seas, or the peat-mosses and diatomaceous earths of temperate climes. The record of [illegible] changes and the remains of man and of the plants and animals which the strata preserved for [illegible] contain, have for some years received great attention. As they form common ground for the antiquary and geologist, they have been diligently investigated by the students of both sciences. The classification adopted for the subdivisions of the Recent Period is based on what is supposed to have been the progress of human civilisation. The first rude inhabitants of a country seem to have been acquainted only with stone implements. These hammers, knives, and spears were made of stone sharpened by chipping the edges, and subsequently by grinding and polishing. In Denmark, [illegible] implements are found buried in peat-mosses, associated with the remains of plants and animals that still live in that or neighbouring countries. The common tree in these mosses is the beech [illegible] has not been a native of Denmark during historical times. Of the same age are the 'kjokken-moddings,' found on the coasts of the Danish islands in the Baltic. They are mounds of the shells of the oyster, cockle, periwinkle, and other edible molluscs, like those formed by the North American Indians on the eastern shores of the United States. The implements found in them are formed of stone, sometimes of wood and bone, but never of metal. Similar 'middens' have been described as occurring in various places in the north of Scotland. The people who built the cairns of the Hebrides and Orkneys of Switzerland were also unacquainted with the use of metals. See CRANNOGE. The paucity or almost absence of human bones in such early deposits, whether in Denmark or Switzerland, is attributed by antiquaries to the supposed practice of burning the dead.

While the lower portion of the Danish peat-mosses is characterised by the presence of stone implements and the trunks of [illegible] the upper portions of the same mosses abound in trunks and acorns of the common oak, and with these are associated implements and articles of bronze. In many of the Swiss pile-buildings, the bronze implements also supplanted those of stone. The various articles exhibit a considerable advance in civilisation, as is to be expected from the using a metal, the possession of which implies the existence of foreign commerce, since tin was in ancient times only obtained from Cornwall.

In progress of time, the oak in its turn disappeared from the surface of Denmark, and was followed by the beech, which still continues to flourish luxuriantly in Denmark. The use of bronze also gradually gave way before the new discovered iron. A few of the lake-buildings seem not to have been abandoned until after the inhabitants became acquainted with the use of iron, as some articles made of this metal have been found at Nidau.

While it is useful thus to characterise the various steps in the civilisation of man, and to associate them with the strata in which they occur, it would be a source of endless error to suppose that all such strata are contemporaneous; for the various ages have really existed at the same time not only in different countries of the world, but even in contiguous regions, and probably implements of the three materials have been used at the same time by different inhabitants of the same district. See BRONZE, AGE OF. The occurrence, then, of stone implements in several deposits exhibits not a similarity of age, but a similar stage of advancement in civilisation, consequently no dependence can be placed on those calculations which trace back the iron, bronze, and stone periods as if they [illegible]

preceded each other in regular chronological series, and each had occupied a given number of years.

RECEPTACLE, in Botany, the expanded and abbreviated termination of a floral axis, bearing many flowers close together, as in the *heads of flowers* of the *Compositæ* and in the fig. The receptacle assumes a great variety of forms, and sometimes, as in the fig, becomes a chief part of the fruit. It is the eatable part of the artichoke, and the 'cheese' of thistles, so well known to schoolboys. The name receptacle is sometimes also given to that part of a single flower from which the whorls of floral envelopes and parts of fructification, or some of them, spring; which, however, is more properly called the *thalamus* or *torus*.

RECE'PTION, Religious, of monks, nuns, and other religious persons, is the ceremonial whereby they are admitted to the probationary state called the Novitiate (q. v.). Before the ceremony of reception, a short preparatory stage must be passed through by the candidate (called at this stage a 'postulant'), the duration of which usually ranges from two to six months. The ceremony of the reception, called also 'clothing,' is performed by a bishop, or a priest delegated by a bishop, and consists in blessing the religious dress or habit, and investing the postulant therein with appropriate prayers, the hair being at the same time cut off, and the secular dress laid aside, in token of the renunciation of the world and its pomps and pleasures. The reception, however, is understood to be only a provisional step; and the novice remains free to return to secular life at any time during the novitiate.

RECI'PROCAL (Lat. *reciprocare*), a term which is employed in Mathematics in a sense analogous to that attached to it in ordinary language. A geometrical proposition is the reciprocal (or *inverse*) of another, when the 'data' of the one are the 'quæsita' of the other, and *vice versâ*. In Algebra, one quantity is the reciprocal of another, when the one is the result of unity divided by the other; thus, 2 and $\frac{1}{2}$, x and $\frac{1}{x}$, $\frac{a}{b}$ and $\left(1 \div \frac{a}{b} \text{ or } \right)\frac{b}{a}$, are reciprocal quantities. The product of a quantity by its reciprocal must always be unity. *Reciprocal or Inverse Proportion*, a term formerly much used in arithmetical treatises, but now, and with much propriety, generally disused, referred to such questions as the following: If a rectangular field be 800 yards long, and 240 broad, what must be the breadth of another rectangular field of equal area which is 960 yards long?—the answer being 200 yards. In this question, we see that the breadths are not proportional to the lengths, but to the reciprocals of the lengths; thus, $\frac{1}{800} : \frac{1}{960} :: 240 : 200$; but in all such problems, it is better for the pupil to be left to exercise his judgment in applying to them the ordinary rule of proportion.

RECITATI'VE (Ital. *recitativo*, from *recitare*, to recite), a species of vocal composition which differs from an air in having no definite rhythmical arrangement, and no decided or strictly constructed melody, but approaches, in tonal succession and rhythm, to the declamatory accents of language; it is, in fact, as near an approach as possible to speech delivered in musical sounds. Recitatives are not performed in any strict species of time, the length of the notes depending on the singer, who lengthens or shortens them according to the expression required. It is, however, usual to note a recitative in common time, in order to facilitate the reading; and when any part of a recitative is to be performed in strict time, this is indicated by the words *rec. a tempo*. When a recitative is accompanied merely by a few simple chords of an instrument, to indicate to the singer the pitch and the harmony, it is called *recitativo secco* or *parlante*, declaimed recitative. When the voice is accompanied by a considerable portion of the instruments of the orchestra, either in sustained chords or florid passages, it is termed *recitativo accompagnato, strumentato*, or *obbligato*. Recitative was largely used in the ancient drama; and is used in the opera to express some action or passion, to relate a story, reveal a secret or design, &c. It is said to have been first introduced in the opera by Emilio del Cavaliere at Rome.

RECLAI'MING, in the Law of Scotland, means the appeal from a judgment of the Lord Ordinary to the Inner House. The reclaiming days are ten days after judgment, except against interlocutors disposing in whole or in part of the merits of the cause. The step by which the appeal is commenced is a reclaiming note.

RECLU'SE (Lat. *reclusus*, also *inclusus*, shut up), a class of monks or nuns who, from a motive of special penance, or with a view to the more strict observance of Christian perfection, remained shut up from all converse, even with members of their own order, in a cell or other place of strict retirement. This practice was not allowed, except to persons of tried virtue, and by special permission of the abbot; and the recluse was, with due solemnity, locked up in the presence of the abbot or the bishop, who placed his seal upon the door, not to be removed without the authority of the bishop himself. The celebrated medieval theologian, Rabanus Maurus, was a recluse, when elected Archbishop of Mentz. Nuns also were found to practise the same voluntary seclusion, especially in the Benedictine, Franciscan, and Cistercian orders. A rule, specially designed for female recluses, was composed by Ælred of Reresby, and is preserved by Holstenius in his *Codex Regularum Monasticarum*, vol. i. p. 418, and following. —In a wider sense, the name recluse is popularly applied to all cloistered persons, whether men or women, even those who live in community with their brethren.

RECO'GNISANCE is a kind of judicial bond entered into with a court of record, the object of which is to secure the doing of some act, as the appearance of witnesses at a criminal trial, or the keeping of the peace by one who has threatened or assaulted another. The form of it is thus: 'A B doth acknowledge to owe to our lady the Queen the sum of ten pounds,' or some other sum to be levied of his goods if he fail in the condition endorsed; and then a condition is added, which states that if the thing secured is done, then the recognisance is to be void. This is the mode by which justices of the peace secure the attendance of the prosecutor and witnesses at the trial of a prisoner who has been committed for trial, or the future good behaviour of one who has committed a breach of the peace. If the thing secured is not performed, then the party bound forfeits his recognisance, that is, a debt of the amount specified becomes forthwith due to the crown.

RECOI'L. When the charge of gunpowder contained in a gun is fired, the sudden expansion of the powder into many times its former bulk acts with equal force in every direction. The resistance offered by the ball, which moves more or less easily in the bore, being far less than that of the bulky and heavier gun and carriage, the ball is forced to a great distance; but the gun, with its carriage, must nevertheless feel the reaction, and is driven

backwards a certain space, ordinarily a few feet. This retrograde motion is called the recoil, and dangerous accidents sometimes take place from it. After the recoil, the gunners have to work the piece back to its former position for the next discharge. In the Armstrong naval gun, and some other modern cannon, the trunnions of the gun are mounted on an inclined plane, up which the recoil drives them; they running down again to their original position by the action of gravity, after the discharge. Other expedients have been tried with greater or less success; among them may be cited a series of solid India-rubber buffers, which, being compressed by the recoil, drove the gun home again on recovering their shape. The gun and shot remaining the same, the recoil is proportionate to the charge.

The recoil of small-arms is known as their 'kick,' and is felt on the shoulder of the marksman.

RECOLLET (Lat. *recollectus*, gathered together), a name given to the members of certain reformed bodies of monastic orders, whether of men or women, in the Catholic Church. Among orders of men, an offshoot of the Augustinian hermits, which, under Louis de Montaya, in 1530, obtained considerable popularity in Spain, was called by this name, and the order still exists at Medina Sidonia, Leon, and Pamplona; but outside of Spain, this order is better known under the title of the REFORMED FRANCISCANS, who were established in France under Henry IV. and Louis XIV., and spread thence into Belgium, their houses in these countries and Germany becoming so numerous that they reckoned no less than ten provinces. A reform of the Cistercian order of nuns in Spain was called by the same name.

RECONNAISSANCE, RECONNOITRE, the noun and verb expressive of the operation of inspecting a country in which military operations are intended. This duty devolves on the department of the Quarter-master General, and requires the exercise of qualities of a very high order. The officer deputed to reconnoitre is well mounted, and accompanied by a small escort, also well mounted, in order to escape if noticed by the enemy. His duty is to measure every natural feature in his district by eye, or by more accurate measurement when practicable, and to produce a map, shewing hills, valleys, streams, canals, plains, woods, &c. He must at the same time note all obstacles: what resources the country possesses to maintain men or horses; what the disposition of the inhabitants, &c. Reconnoitring is necessarily a very dangerous service; an officer so employed has often to resort to disguises, and if taken, runs some risk of being treated as a spy.—A maritime reconnaissance is analogous.

RECORD, as a legal term, is used in the United Kingdom to signify the formal statements or pleadings of parties in a litigation. In general, the rule is well settled that the pleadings which make up the record do not enter into details of the evidence, but merely set forth the conclusions or inferences, leaving the details of evidence to be supplied at the trial before a jury, or, if there is no jury, at the hearing before the judge or court. All the higher courts file the records in the suits, and are called Courts of Record, and one of the incidents of a Court of Record is, that the court or judge can commit for contempt any person who insults the court, or wilfully obstructs the business. A trial by record means that one of the parties has set up some former decision of the court, while the other denies that such a decision ever existed; whereupon, the only mode of solving the question is by producing the record of the former action, and so

The various courts being the king's courts, and following the sovereign from place to place, their earliest receptacles were the royal palaces in different parts of England; but when the higher courts were permanently established at Westminster, 'treasuries,' or places of custody for the records of the different courts, were appointed there. A portion of the public records were, as far back as Henry III.'s reign, deposited in the Tower of London and New Temple; and in the reign of Edward III. the Tower had become a permanent treasury. The parliamentary committee of 1837 enumerated among the places of deposit a room in the Tower over a gunpowder magazine, and contiguous to a steam-engine in daily operation; a chapel at the Rolls, where divine service was performed; underground vaults at Somerset House; damp and dark cellars at Westminster Hall; the stables of the late Carlton Ride; and the Chapter-house, Westminster. From the reign of Edward II. downwards, the attention of parliament had often been called to the safe custody and arrangement of the records as an object of solicitude. The fullest examination in recent times was made by a committee of the House of Commons in 1800, whose Report presents far the most comprehensive account of the records in existence. A commission was appointed to go on with the work which the committee had begun, and renewed six times between 1800 and 1831. All the several record commissions directed the commissioners to cause the records to be methodised, regulated and digested, bound and secured, and to have calendars made, and original papers printed; and numerous valuable publications have been issued by the commissioners from time to time. A full investigation into the proceedings of the Record Commissioners was made by a committee of the House of Commons in 1835, since which time annual Reports have been issued by the deputy-keeper of records. The most important recent statute regarding the custody and preservation of the records in 1 and 2 Vict. c. 49, which restores to the Master of the Rolls that custody of the records which he had originally possessed, but which had for a long time become nominal. That officer is empowered to appoint a deputy-keeper of the records, and in conjunction with the Treasury, to do all that is requisite in the execution of this service. He makes rules for the management of the office, and fixes what fees may be demanded. He allows copies to be made, which, when certified by the deputy and assistant keepers, and authenticated with the seal of the office, are producible as evidence in courts of law. The Home Secretary directs from time to time such of the catalogues, calendars, and indexes, and such of the records as he thinks fit, to be printed, and sold at prices fixed by him. The act 1 and 2 Vict. c. 94 contemplates the consolidation of all the records in the large receptacle near Fetter Lane, into which, under Sir John Romilly, the present Master of the Rolls, they are in process of being collected from their different scattered depositories.

Our limits will not allow us to enumerate more than a very few even of the more important classes of records. One class consists of the various territorial surveys, beginning with *Domesday* (q. v.), and including, among others, the *Rotuli Hundredorum*, *Extenta Manerii*, *Testa de Nevill*, *Pope Nicholas's Taxation*, *Henry VIII.'s Survey*, and the *Survey of the Commonwealth*. Another extensive class belong to the *Exchequer*, including the *Pipe Roll*, or Great Roll of the Exchequer, beginning with the second year of Henry II., containing the yearly accounts of the revenues of the crown, certain and casual; the *Memoranda* and *Originalia* rolls, records of *First-fruits and Tenths*, records of the *Court of Augmentations*, instituted to decide questions regarding possessions belonging to the crown, on the dissolution of the monasteries, and *Placita*, or records of pleadings and judgments. The *Rotuli Curiæ Regis* contain the record of the proceedings in the ancient supreme court of law; and there are numerous classes of records of the proceedings in all the various courts of common law and in the Court of Chancery. The record of *Fines and Recoveries* is an unbroken record of the transfer of lands from 25 Henry II. down to 1833, when this species of conveyance was abolished. The *Charter Rolls* are records of charters, of grants of privileges to religious houses, towns, and corporations, and creations of nobility from 11 Edward II. to Edward IV. The *Patent Rolls* are enrolments of instruments written on open (*patentes*) sheets of parchment, having pendent from them the Great Seal, addressed to the lieges in general. The *Close Rolls* are records of such letters under the Great Seal as were despatched closed or sealed up—royal mandates to particular persons for particular purposes, and not intended for public inspection. The *Liberate Rolls* contain writs issued out of Chancery, ordering the payment of money from the Treasury. The *Fine Rolls* contain accounts of fines paid to the king for licence to alienate lands, freedom from knight-service, passing or renewal of charters, wardships, safe-conduct, pardons, &c. The *French Rolls*, *Norman Rolls*, and *Gascon Rolls* relate to the affairs of France, Normandy, and Gascony, when held by the English; and the *Rotuli Scotiæ* to transactions with Scotland. An important class of the records are those connected with parliament, including *Statute Rolls*, *Parliament Rolls*, *Records of Parliament*, and *Statutes* from 1485 to the present time, with the *Journals of the Lords and Commons* from Henry VIII. to the present time, and the *Writs of Summonses* and returns to parliament.

The *state papers* originally sprung from the Privy Council and Chancery, and include the correspondence of the Privy Council, secretaries of state, and other public departments, with miscellaneous domestic papers from the time of Henry VIII. to George II., a mass of correspondence with foreign powers, and an extensive collection relating to ecclesiastical affairs at and after the Reformation. Since 1855, the State Paper Office has become a part of the Public Record Office, and been placed under the control of the Master of the Rolls. Much has been done in the way of calendaring and arranging the contents of this valuable repository, and nine volumes of calendars of state papers have been issued to the public.

By the regulations established by the Master of the Rolls, 5th July 1858, persons desirous of consulting the public records, including state papers, for a literary purpose, have to apply in writing to the deputy-keeper, stating the objects of their search, which, if necessary, may be more fully explained at a personal interview. If the explanation be satisfactory, a permission is issued to inspect and make extracts without payment of fees.

Scotland.—The public records of Scotland were undoubtedly numerous and multifarious as early as 1282; but the more ancient of them were lost by shipwreck in the reign of Edward I. of England. The control of the records has from very early times been intrusted to the Clerk Register, or Lord Clerk Register, one of the high officers of state, who had a seat in the Scottish parliament, to whom, and his deputies and other officers appointed by him, it was assigned to superintend both their formation and their custody. The earliest records of Scotland were in the inconvenient form of rolls, but in the reign of David II. the practice was introduced of

writing them in books. By an act of 1463, the king's rolls and registers were appointed to be put in books; but the accounts in the Exchequer continued, nevertheless, to be kept in rolls till the passing of another act in 1672, appointing them to be written in books. Prior to the reign of Charles II., the public records were deposited, under care of the Clerk Register, in the Laigh Parliament House, now part of the Advocates' Library; and shortly before the Union, the whole records were transferred to that depository, where they continued till the erection of the large building called the General Register House, which was completed in 1787, and has recently been added to. The Register House serves the purpose of preserving and making available the national muniments, as well as accommodating the whole offices of record connected with the supreme court. The Lord Clerk Register and his depute have now merely the *custody* of the records, their preparation being intrusted to another class of officers.

Under the Scottish records are included the acts of parliament and of Privy Council, and the records of all the various courts of justice; also the records of the Great Seal, Privy Seal, and Signet. An important class of records are the *Retours of Services*. A service is by the law of Scotland necessary to transmit a right to real property to the heir from his ancestor. At present, this service consists of the decision of the sheriff of the county or the sheriff of Chancery; but the form in use till 1847 was by retour, a writing which contained the verdict of a jury returned in answer to a brieve from Chancery for finding the heir at the death of his ancestor. The register of retours is not extant further back than 1547.

The registers connected with the transmission of heritable rights are even more important. After several unsuccessful attempts to introduce a system of registration, the great branch of the public records known as the *Register of Sasines* was established by act 1617, c. 16. By the system then introduced, which has since been continued with modifications in detail, all instruments requisite to the transmission of real property must be put on record for publication. Besides the principal register in Edinburgh, there are district registers, and any instrument may be recorded either in the general or district register. Volumes are issued from the General Register House to the district recorders of sasines, which, when filled, are returned to the General Register House. By this means the title to real property can be ascertained with certainty and precision, and may, if necessary, be traced back two centuries and a half. It is also obligatory to record in separate registers all instruments necessary for the constitution, transmission, and extinction of voluntary encumbrances. See REGISTRATION OF DEEDS AND WRITS. The system, while confirming the credit of the proprietor, also operates in favour of the security of creditors. There is a special *Register of Entails*, in which, in terms of act 1685, c. 22, deeds of entail must be recorded at the sight of the Court of Session.

The object of registration in all these cases is *publication;* but charters by subjects, dispositions, bonds, contracts, and other probative writs may, under act 1698, c. 4, be recorded in the *Register of Deeds* for *preservation*. A third object of registration is *execution*. Every deed constituting a personal claim of debt, or an obligation to perform some lawful prestation, if intended to be made the subject of personal diligence for payment or performance, must be registered previously to execution being issued on it.

Ireland.—Many of the records perished during the wars prior to the final reduction of Ireland, and those which escaped these commotions were long exposed to mutilation and destruction from the unsatisfactory arrangements for their custody. A commission was appointed in 1810 for the preservation and arrangement of the Irish records, whose labours, conducted with considerable success, were terminated by the revocation of the commission in 1830. In 1847, commissioners were again appointed to investigate the state of the records, in consequence of whose labours a bill for their safe custody was proposed, but afterwards abandoned. There is no general place of custody for the records of Ireland, which are scattered in different repositories in Dublin. Several volumes of extracts from the Irish *patent* and *close rolls* have lately been published under the direction of the Master of the Rolls, but they are not considered to be so satisfactorily edited as the English record publications.

RECORDE, Robert, generally allowed to have been the greatest English mathematician of the 16th c., but now almost forgotten, was born about 1500 at Tenby, in Pembrokeshire, Wales. He completed his education at Oxford, and there distinguished himself in mathematics, rhetoric, music, and anatomy; but wishing to make medicine his profession, he removed to Cambridge, and there, in 1545, he received the degree of M.D., 'being much admired by all who knew him for his profound and varied knowledge of art and science.' In 1547, he was in London, engaged in the composition of *The Urinal of Physic* (1548), a work which saw five editions; and was about the same time appointed family physician to Edward VI., and afterwards to Queen Mary. Ten years after this, we find him in the debtors' prison in London, where he died miserably in 1558. His works are all in the form of dialogues between a master and his pupil, and are written in the rude English of his time; they are—*The Gate of Knowledge*, and *The Treasure of Knowledge*, two works which seem to be completely lost; *The Ground of Arts, teaching the Perfect Work and Practice of Arithmetic*, &c. (Lond. 1549), an arithmetical work which has been frequently reprinted, and which exhibits a curious 'melange' of the Arabic and Roman notation; *The Pathway to Knowledge* (Lond. 1551), an abridgment of Euclid's *Elements*; *The Castle of Knowledge, containing the Explanation of the sphere both Celestial and Material*, &c. (Lond. 1551), an astronomical work, dedicated to Queen Mary, in which he compares the Ptolemaic and Copernican systems, and, but with great hesitation, gives the preference to the latter; *The Whetstone of Wit, which is the second part of Arithmetic*, a treatise upon algebra, a subject at that time little known, in which R. collects the substance of the best continental writers, and adds his own improvements and discoveries. In the appreciation of the general results derivable from algebraic formulæ, he is far beyond his contemporaries, with the sole exception of Vieta (q. v.). R. is regarded as the inventor of the symbol (=) for equality, and of the mode of extracting the square root of compound quantities. R.'s talents seem to have been as varied as profound, for, besides his mathematical pre-eminence, he was considered to be a skilful doctor, an able lawyer, and a philologist of no mean ability.

RECORDER is a judge of a city or borough Court of Quarter Sessions, being a barrister of not less than five years' standing. He is appointed by the Home Secretary, and the salary is paid by the city or borough out of the borough rate. His duties are the same as what are usually discharged by Courts of Quarter Sessions, and are confined

chiefly to the trial of prisoners who have been committed by justices of the peace for trial during each quarter of a year. The recorder is not prohibited from practising at the bar, and he is almost invariably a counsel in active practice. The salary is generally small, but, nevertheless, the office is in great request among members of the English bar. There is no such office in Scotland, but the sheriff discharges similar duties.

RECORDER, the name of a musical instrument formerly in use in this country, somewhat like a flageolet, but with the lower part wider than the upper, and a mouthpiece resembling the beak of a bird. Its pitch was an octave higher than the flute, and it had a pleasing tone, hence Milton speaks of

> The Dorian mood
> Of flutes and soft recorders.

RECO'VERY, in English law, was a term much used in reference to estates tail, though it is also a general term denoting the decision of a court in favour of a party claiming lands or goods. A feigned recovery was an imitation of a similar proceeding, and was a device invented to break an English entail. An estate tail was an estate given to A and the heirs of his body, and at first it was enacted by a statute *De Donis*, under Edward I., that A could not sell or alienate the estate, so as to prevent the heirs of his body acquiring the benefit of it. But the lawyers invented a sham action and judgment, called a recovery, by which the issue were barred from all rights. The Fines and Recoveries Act abolished that form, and substituted for it a disentailing deed, which, when executed by the tenant in tail, has the same effect.

RECRUI'TING. Formerly, the task of raising recruits for the British army was intrusted to the colonels of regiments, who employed civilian agents and others to persuade young men to join their standards; these agents often resorting to very illegal methods to entrap recruits. Subsequently, the duty was assigned to several recruiting corps, each known by the name of its commanding officer; but under this system, so many irregularities, and such difference of practice arose, that in 1802, for purposes of uniformity, economy, and proper control, it was decided to place the whole recruiting under the immediate direction of the adjutant-general. For this purpose, the country was divided into recruiting districts. At the head of each district was placed an inspecting field-officer, with the duty of superintending all recruiting parties in his district, and of approving the recruits brought. At some of the principal places in the district, superintending officers are stationed to overlook the recruiting parties. At the district headquarters, there is a paymaster, responsible for all the financial concerns, and a medical officer, who examines the recruits in point of health and physical fitness. This system still obtains, though the number of districts has been greatly reduced from the original number. At present, Great Britain is divided into five recruiting districts, having their headquarters respectively at Leeds, Liverpool, Bristol, London, and Glasgow. In Ireland, there are three districts; headquarters, Belfast, Dublin, and Cork. The total cost for the year 1864—1865 is £21,724 for these establishments, exclusive of £80,747 for levy-money, transport, &c., of recruits. Staff-officers and serjeants of the Pensioner Force are also occasionally entrusted with the obtaining of recruits.

Recruiting parties consist of old sergeants, who seek by every means to induce young men to enter the army; they frequent fairs, wakes, and country gatherings, endeavouring by beat of drum, smart uniforms, well-fed personal appearance, and persuasion—not always too truthful—to convince the rustics of the advantages of the Queen's service; advantages which really exist, though not always to the extent depicted. About 12,000 recruits are raised annually in time of peace for the British army.

The United States recruiting service is conducted by the adjutant-general, under the direction of the Secretary of War. Recruiting parties consist, generally, of a lieutenant, &c., who must not permit any man to be deceived or inveigled into the service by false representations. If the recruit is a minor, his parents or guardians must, if possible, be informed of the minor's wish to enlist, and their written consent obtained therefor. Any free white male person, above the age of 18 and under 35 years, being at least 5 feet 3 inches high, effective, able-bodied, sober, free from disease, of good character and habits, with a competent knowledge of the English language, may be enlisted. No man having a wife or child can be enlisted in time of peace without special authority from the Adjutant-General's office. Within six days after his enlistment the recruit must take the oath of allegiance to the United States of America, to serve honestly, and to observe the orders of the officers appointed over him, &c.

Recruiting for the navy is treated under MANNING THE NAVY.

RE'CTIFYING is a process applied to alcohol after its distillation, to remove certain impurities which come over with it from the still. These, in part, consist of essential oils; and in order to effect their removal, caustic potash is added in sufficient proportion to saponify the oil present; water is also contained in the first distillation, and to remove this, and to assist in removing the oily matters, common pearl-ash is added. Technically, the former of these is called *gray salts*, and the latter, *white salts;* and about four pounds of each are added to every 700 gallons of spirit, and well agitated, so as to combine with the oil and water. The spirit is then distilled again, and comes over much more pure, the alkaline salts, and the matters which have been combined with them, being left behind in the still. This is usually repeated two or three times, the quantity of the salts being diminished to one-half in the second, and proportionately decreased in the succeeding distillations. The rectifier is not only a purifier of the alcohol produced by the distiller, but he often gives it a distinctive character; by adding flavouring materials to it, he makes it into gin, brandy, &c. Thus, in order to convert the spirit into London gin, juniper berries and coriander seeds are added previous to the last rectification. Œnanthic ether and other things give the flavour of brandy. This part of the operation is very much varied by the taste and skill of the rectifier.

RECTOR (Lat. *rector*, a ruler), the title of several classes of clerical and collegiate officials, some of which are referred to under their respective heads. As regards clerical rectors, the title, in its most ordinary English use, is applied to the clergyman who holds complete and independent charge of a parish. This use, however, is a departure from the canonical signification of the title, which meant rather a clergyman who was appointed to govern a parish where the chief parochial jurisdiction was vested in a religious corporation or in some non-resident dignitary. In certain of the monastic orders, the name rector is given to the heads of convents, as it is also given to the heads of universities, colleges, seminaries, and similar educational corporate institutions.

RE'CTUM, DISEASES OF. The terminal portion of the intestinal canal, named, from its comparatively

straight course, the rectum, is the seat of various affections requiring medical or surgical assistance. Some of these affections, as piles, prolapsus ani, and haemorrhage from the rectum, have already been considered. Amongst the other diseases of the rectum of sufficient importance to claim notice in these pages are—

1. *Stricture of the Rectum*, which may be either spasmodic or permanent. *Spasmodic stricture* is comparatively rare. *Permanent stricture* may be either of a simple or malignant nature. *Simple stricture* consists in a thickening and induration of the mucous coat of the rectum, so as to form a ring encroaching on the calibre of the tube. It is situated about two or three inches from the anus, and the contraction is so great and unyielding that it is often difficult to pass a finger through it. The symptoms are constipation and great pain, and a straining in evacuating the faeces, which are passed in a narrow, flattened, or worm-like form, which is very significant of the nature of the case. In an advanced stage of the disease, diarrhoea and prolapsus often supervene. However great may be the constipation, strong irritant purgatives must be altogether avoided. Soft and unirritating evacuations must be procured by such medicines as the confection of senna combined with sulphur (see PILES), or injections of castor-oil or of tepid water. The diet should be regulated so as to assist the action of the medicines. Nutritious soups are serviceable, since, at the same time, they support the strength and leave little matter to be excreted. When much local irritation is present, it may be relieved by the hip-bath and by sedative injections; till it is subdued, surgical interference would do more harm than good. A bougie capable of being passed with moderate pressure through the stricture, should be inserted in the gut every third or fourth day, and should be allowed to remain for about a quarter of an hour; and its size should be gradually increased. Nothing is gained by the forcible passage of large bougies. The cure is to be effected by pressure so applied as to produce absorption, not by mere mechanical dilatation. *Malignant stricture*—most commonly due to the scirrhous, but sometimes to the epithelial form of cancer—is by no means a very rare affection, and is more common in the female than the male sex. Until ulceration sets in, the symptoms are like those of simple stricture, only exaggerated in degree; but afterwards there is a discharge of fetid muco-purulent matter streaked with blood. In this disease, the treatment can be only palliative, unless the surgeon resort to the formation of an artificial anus in the loins as a last resource.

2. *Spasm* of the *sphincter ani* muscle is characterised by extreme pain in the region of the anus, especially when an attempt is made to evacuate the bowels. The muscle contracts so firmly that the surgeon cannot easily introduce the finger into the rectum. The spasm may be caused by piles, by fissure of the anus, by ulceration of the rectum, and sometimes apparently by mere constipation. It is often relieved by the application of the Belladonna Ointment of the British Pharmacopœia.

3. *Neuralgia of the rectum*, known also as *proctalgia*, is a common disorder, and is especially prone to attack children and gouty persons. It is usually relieved by the judicious use of aperient medicines.

4. *Congestion*, sometimes proceeding to *inflammation*, is not uncommon in the rectum. The congestion occasions a sense of weight and fulness in and about the rectum, together with a variety of other symptoms. Amongst the causes of this affection are stone in the bladder, stricture of the urethra, an enlarged prostate gland, the presence of thread-worms, the abuse of irritating purgatives, exposure to cold draughts to the perinæum, &c.; and there can be no doubt that sedentary habits strongly favour the predisposition to this affection. The great object of treatment is to relieve the congested vessels of the rectum. The bowels should be freely opened with castor-oil, leeches should be applied to the verge of the anus, and after their removal a warm hip-bath is advisable.

5. *Pruritus ani*, or itching of the anus, is a very common and extremely troublesome affection. Sometimes it depends on the presence of thread-worms or of old piles, while in other cases it is one of the manifestations of that skin-disease known as *Prurigo* q.v. The treatment must depend upon the exciting cause.

6. *Fissure of the anus* is a small crack which gives intense pain during the passage of the faeces, and often persists for several hours. Free purgatives, and the application of astringent lotions or ointments (as tannin lotion or ointment of gallic acid) should be tried; and if they fail, partial division of the sphincter muscle must be resorted to—an operation easily performed, and certain to give relief.

7. *Fistula in ano* signifies a fistulous or pipe-like track by the side of the sphincter and muscle. It may occur as a *complete fistula*, which has an external opening near the anus, and an internal opening into the bowel; or as a *blind external fistula*, which has no actual opening into the bowel, although it extends to its outer coat; or as a *blind internal fistula*, in which the preceding conditions are reversed. A sketch of the mode of treatment is given in the article FISTULA.

For a detailed description of these diseases of the rectum, and for information on many other less important affections of this part of the body, the reader is referred to Bushe's *Treatise on the Rectum*, and to the more recent works of Mr Ashton and Mr Henry Smith on the same subject.

RECUSANTS, in English law, are persons who refuse or neglect to attend at the worship of the established church on Sundays and other days appointed for the purpose. The offence as a legal one may be held to date from 1 Elizabeth c. 2, but there were four classes punishable under the statutes against recusancy—simple 'recusants,' 'recusants convict,' who absented themselves after conviction, 'popish recusants,' who absented themselves because of their being Roman Catholics; and 'popish recusants convict,' who absented themselves after conviction. It was against the last two classes that the statutes were mainly directed. In addition to the general penalties of recusancy, the popish recusants, for wilfully hearing mass, forfeited 100 marks (£66, 13s. 4d.); and for saying mass, 200 marks, or £133, 6s. 8d., in addition (in both cases) to a year's imprisonment. They were disabled, unless they renounced popery, from inheriting, purchasing, or otherwise acquiring lands; and they could not keep or teach schools under pain of perpetual imprisonment. Popish recusants convict could not hold any public office; could not keep arms in their houses; could not appear within ten miles of London under penalty of £100; could not travel above five miles from home without license; could not bring any action at law or equity; could not have baptism, marriage, or burial performed, except by an Anglican minister; all under penalties of forfeiture and imprisonment. Protestant dissenting recusants were relieved from the penalties of recusancy by the Toleration Act of 1 Will. and Mary, c. 18. Catholics were partially relieved in the year 1791, and completely by the Emancipation Act of 1829.

REDA'N is the simplest work in field-fortification. It consists of two parapets whose faces join in forming a salient angle towards the enemy, like a letter V, in which the apex is to the front. Regarded by itself, the redan is a work of very little strength, since there is no flanking fire to protect its faces, and nothing to prevent an enemy from forcing an entrance at the gorge; but redans are useful in many positions, and the rapidity with which they may be constructed, renders them favourites with engineers and generals. A row of redans along an exposed front of an army adds much to its strength, the troops behind protecting the gorge, and the redans flanking each other. It forms an excellent defence for a bridge-head, the gorge being covered by the river. Redans figured largely in Wellington's works for defending Lisbon in 1810. The redan of Sebastopol in 1855 was the principal point of the English attack, and the scene of two bloody repulses by the Russians in June and September.

REDBREAST (*Erythaca rubecula*, or *Sylvia rubecula*), a bird of the family *Sylviadæ*, familiar to every one in the British Islands and throughout most parts of Europe—a universal favourite, from the readiness with which it approaches or enters human habitations, its lively manners, its aspect of pert curiosity, the frequency with which its song is heard in autumn and winter, and the strange mixture of shyness and audacity which its behaviour displays. It is generally known throughout Britain by the endearing name of *Robin Redbreast*, or more briefly *Robin*, and has many similar appellations in continental Europe, significant of the kindly regard entertained for it, which is everywhere such that children early begin to distinguish it from all other birds as their peculiar favourite. Its utmost length is about $5\frac{3}{4}$ inches, but it is of a rounder and fuller form than many of the *Sylviadæ*, the slenderness of its legs rather strikingly contrasting with the form of the body. The wings are rather short, the fifth quill the longest. The tail is scarcely forked. The bill is rather broad and depressed at the base, narrower and slightly compressed at the point, the upper mandible bent down and notched. The general colour is olive-brown, and the reddish-orange breast is a conspicuous characteristic, particularly of the male. —The R. is a native not only of Europe, but of the western temperate parts of Asia and of the north of Africa. In the most northern parts of Europe it does not appear; and in many northern regions it may be regarded as a bird of passage; but, contrary to the ordinary rule as to birds of passage, it never congregates in flocks; it is always seen either solitary or in pairs. The attachment of pairs seems to extend beyond the mere breeding season, and, indeed, throughout their lives, and to be stronger than in most birds. The breeding season is early in spring. The nest is made of moss, dead leaves, and dried grass, lined with hair, often placed a little above the ground in a bush or among ivy on a wall; the eggs five to seven in number, white, spotted with pale reddish-brown; but many are the stories of the curious situations in which the R. has built its nest, in close proximity to houses and workshops, regardless of the presence of human beings, and of the noise of hammers and wheels. In winter, the R. seeks the neighbourhood of human habitations more than in summer, and becomes more bold and familiar. Its food ordinarily consists of worms, insects, and berries; and when it becomes a pensioner at any door or window, which it very readily does, it shews a particular relish for small scraps of meat. Its song is sweet and plaintive, but weak, not much noticed amidst the many voices of summer, but often heard in the quietness of autumn, and even of winter, throughout which it is continued whenever the weather is good.

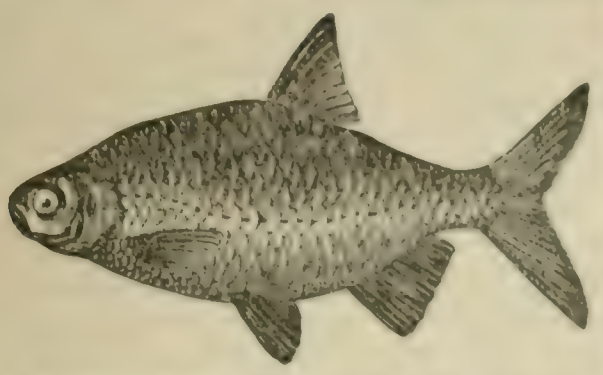
In America, the name R. is often given to the Blue Bird (q. v.).

RED COLOURS. Those used by painters consist of certain chemical compounds, natural or artificial. Thus, the red pigment called Armenian Bole, is either the ochreous earth known by that name, imported from Armenia, Tuscany, and other places, or else, as is most frequently the case, it is a composition of whiting, red oxide of iron, and red ochre. Vermilion is a sulphuret of mercury produced either naturally or artificially. Chrome-red is made by boiling carbonate of lead with chromate of potash in excess, until it assumes a red colour, after which it is washed in pure water, and dried in the shade. Indian-red is a native product of Persia, being found in the neighbourhood of Ormuz. It is imitated by calcining colcothar with red ochre. Light-red is made by calcining yellow ochre, and this can be converted into flesh-colour by a due admixture of white. A bright orange-red, sometimes called Sandix, is made by calcining white-lead. Minium, or Red Lead, is a very distinct red colour, requiring but little preparation; it is much used. Red ochre is extensively found in the Mendip Hills, and is an oxide of iron; with clay, it forms a brownish-red paint. There are several other red colours, but these are the principal ones employed by painters.

RED CRAG, a deposit of quartzose sand intermixed with rolled and comminuted shells, of a deep ferruginous or ochreous colour, which occurs in Suffolk, and belongs to the Pleiocene strata (q. v.).

RED DEER. See STAG.

RE'DDITCH, a large manufacturing town of Worcestershire, stands on an acclivity $12\frac{1}{2}$ miles south-south-west of Birmingham, with which it is connected by railway. Needles, pins, fish-hooks and fishing-tackle, are made extensively. Pop. (1861) 5571.



REDDLE, RADDLE, or RED-CHALK, an ochrey red-clay iron ore, which is chiefly imported from the continent, where it is found in Hessia, Thuringia, Upper Lusatia, Silesia, and Salzburg. It is found in small quantities in England, in the neighbourhood of Rotherham, and at Wastwater, Cumberland. The English differs somewhat in quality from the foreign, and is chiefly used in polishing spectacle glasses. Of that from abroad, the finest quality is used for drawing on paper; the inferior sorts are used by carpenters and others for marking with; and the commonest is used for marking sheep. It occurs generally in thin beds, in clay-slate.

REDE'MPTION, in Law, the right of redeeming property which has been pledged to secure a debt. The equity of redemption is the name given to this right, and is commonly used in reference to mortgages of real estate, the mortgagor, after executing a deed of mortgage, having a right at any time to pay off the debt, and redeem or get back his property, unless he has been foreclosed by the creditor by a legal proceeding, the object of which is to sell the property to pay the debt. In Scotland, the equity of redemption is more usually called a reversion.

REDE'MPTIONISTS, one of the names of an order of monks devoted to the redemption of Christian captives from slavery. They are more frequently called TRINITARIANS (q. v.).

REDEMPTORISTS, called also LIGUORIANS, a congregation of priests founded by St Alfonzo Liguori (q. v.).

RED-EYE, the *Ambloplites rupestris*, Raf., a fish of the Perch family, related to the sunfish (*Pomotis*). It is found in all the tributaries of the Mississippi, and is an excellent table-fish; it reaches a weight of 2 pounds. Also (*Leuciscus erythrophthalmus*, see LEUCISCUS), a fish of the family *Cyprinidæ*, common in lakes, slow rivers, fens, &c., in many parts of Europe and in England. It much resembles its congener, the Roach (q. v.), but is shorter and deeper. It is a richly-coloured fish.

Red-eye, or Rudd (*Leuciscus erythrophthalmus*).

RED GUM is the popular name for the papulous disease of the skin known to the physician as *strophulus*. It is a florid eruption, usually occurring in infants before or during their first dentition, and appearing on the most exposed parts, as the face, neck, arms, and hands, from whence it sometimes extends to other portions of the body. It occurs in minute red pimples, irregularly arranged, with occasional red patches, and sometimes a few interspersed vesicles. White pimples, popularly known as *white gum*, are also sometimes intermingled with the red papillæ. Strophulus is almost always an acute disease, seldom lasting more than a month. It is almost always an innocent complaint, and often occurs without any marked disturbance of the general health. In severe cases, the pimples cause a sensation of heat and itchiness, especially if the child is kept too warm, and slight febrile symptoms manifest themselves. Amongst the probable causes of this disease are the irritation caused by rough flannel next the skin, want of cleanliness of the skin—especially in relation to the child's excretions – the general disturbance of the system excited by teething, &c. Very little is required in the way of treatment further than to remove any obvious cause of the affection. Cold applications should be carefully avoided, lest they should translate the cutaneous irritation to some important internal organ. In the event of such a translation, the child should be placed in a hot bath, and mustard poultices, or hot moist cloths sprinkled with turpentine, should be applied over the arms and chest.

RED HAND, in Heraldry. A sinister hand erect, open, and couped or, the wrist gules, being the arms of the province of Ulster, was granted to the baronets of England and of Ireland as their distinguishing badge, on the institution of that order in 1611, and is borne by the baronets of Great Britain and of the United Kingdom. It is assumed into the armorial coat, and may be borne upon a canton, or on an escutcheon, which may be placed either in the middle chief or in the fess point, so as least to interfere with the charges composing the family arms.

REDHOT Shot are [illegible] heated to redness, and [illegible] of shooting, magazine, powder, cartridges, &c., to [illegible] destruction by fire when [illegible] ammunition. In modern warfare, shells containing molten iron are provided to be used in lieu of red-hot shot, but they have not yet been found to answer perfectly, although a similar device was successfully [illegible] in 1864 by the United States forces when [illegible] Charleston.

REDING, Aloys von, the famous champion of Swiss independence, was born in 1755, in the canton of Schwyz. After serving in Spain he returned to Switzerland in 1788. As commander of the canton of Schwyz he repulsed the French Republicans, May 2, 1798, at Morgarten. After the formation of the Helvetic Republic he was one of those who urgently worked for the restitution of the old federal constitution. In 1802 he hoisted in the eastern parts of Switzerland a banner, with the inscription of overthrowing the central government. When, after the departure of the French, almost all the cantons declared themselves against the Helvetic government, he called a general diet at Schwyz, which assembled September 27, 1802, and occupied itself with the formation of a new federal constitution. He went to Paris, in order to win over the First Consul to the proposed change. In spite of all his endeavours, however, he failed to succeed. The disarmament of the Swiss by a French army, and the acceptance of the act of mediation, put an end to his hopes and to his political activity. In 1803 he officiated still as Landamman, or chief magistrate, of Schwyz; but after that retired into private life till 1809, when he was invested once more with the same dignity. In 1813, Reding conducted the negotiations with the allies in regard to the neutrality of Switzerland. He died in February 1818, leaving the character of an honest man, whose political career might have been more successful, but he had not been wanting in firmness of mind and of character.

RED-LIQUOR, a chemical compound much used by dyers. It is a crude acetate of alumina, and is commonly prepared in dyeing establishments by dissolving a quantity of alum in boiling water, and separately dissolving, also in hot water, three-fourths as much acetate of lead. The two solutions are next mingled together, and after settling the clear fluid, which is the red liquor, is poured off. The sediment is sulphate of lead.

REDOUBT is a small fort of varying shape, constructed for a temporary purpose, and usually without flanking defences. The term is vague in its acceptation, being applied equally to detached posts and to a strong position within another fortress. Redoubts as a general rule do not exceed 40 yards square, with 4 guns and a garrison of 320 men. Redoubts are made square, pentagonal, and even circular. Each redoubt has parapet, ditch, scarps, banquette, &c., as in regular fortification; but it is commonly rather roughly constructed, haste and unpractised labour precluding mathematical accuracy. The entrance may be by a cutting through the parapet, as at *a*, in fig. 1, the cutting being covered within by a traverse; or, preferably, by an excavated gallery leading into the ditch, and thence by a ramp through the counterscarp. For the sake of flanking the ditch, and preventing an assaulting party from forming in it, caponnières or casemates, loopholed, are sometimes formed, as at *b*, *c*, if the soil be stiff or chalky, a gallery may be cut behind the counterscarp, and loopholed towards the ditch. In some modern redoubts, the line of

each side is broken to afford flanking defence, as in fig. 2. Redoubts have the weak feature of

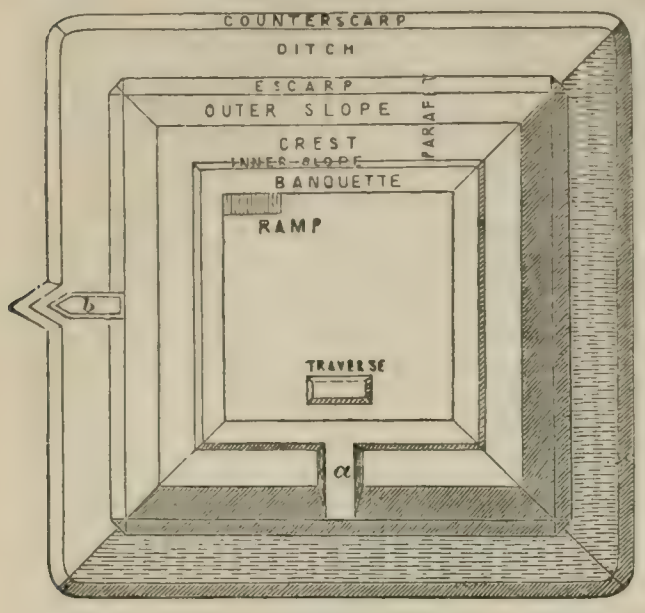


Fig. 1.

not defending their own ditches, and of being approached at their salient angles with comparative impunity. They are therefore not adapted to a protracted defence, but as temporary field works, or in a war of posts, they are often of incalculable importance. Troops whose stability in the open field is doubtful, are especially strengthened by redoubts in their line. Redoubts are particularly useful in fortifying the tops of hills, or commanding passes, or where the object is to occupy a hostile territory, or to feel the way gradually through a wooded country.

Fig. 2.

REDOUT KALÉ, a flourishing, fortified seaport of Russia in Trans-Caucasia, stands on the eastern shore of the Black Sea, 10 miles north of Poti. It is the port of Tiflis (q. v.), carries on a considerable trade, and has regular steam-boat communication with Trebisond, Smyrna, Constantinople, and Marseille. Its chief articles of import are cotton, silk, and woollen stuffs; sugar-cane, wine, spices, and hardwares. The principal exports are raw silk, wax, wool, skins, caviare, and timber. The quantity of silk exported is 10,000 puds (value £68,000) a year. All the other exports taken together do not amount to more than £12,000 a year. During the Crimean War, the Russian garrison at R. K., finding the fort invested by Sir Edmund Lyons with several men-of-war, set fire to the town, 19th May 1854. It has since, however, been rebuilt and strengthened. Population inconsiderable, though increasing.

REDPOLE. See LINNET.

RED RIVER, the lowest western branch of the Mississippi, rises on the eastern border of New Mexico, flows eastward, separating Texas from the Indian territory, thence south-east through Louisiana, and enters the Mississippi 341 miles from its mouth. It is 2100 miles long, and receives numerous branches, the Washita, Negro, Big and Little Wichita, &c. Near its source, the south branch runs for 60 miles between perpendicular banks, 600 to 800 feet high. It is navigable for 8 months of the year to Shreveport. Thirty miles above this place is the Great Red River raft, formed of drift-wood, which blocks up the river for 60 or 70 miles. Its other important towns are Alexandria and Natchitoches.

RED RIVER OF THE NORTH rises in a cluster of lakes in Western Minnesota, U.S., near the sources of the Mississippi, and runs north, separating Minnesota from Dacotah, into the British possessions, and empties into Lake Winnipeg, about 500 miles from its source, watering a beautiful country, and receiving numerous branches, the chief of which are the Shyenne, the Pembina, and the Assiniboine.

RED RIVER SETTLEMENT, now known as the province of Manitoba, is intersected by the Red River of the North and the Assiniboine, and lies between lat. 49° and 53° 30′ N., and long. 96° and 99° W. It forms a small part of the territories formerly governed by the Hudson's Bay Company, and was purchased from them by the Earl of Selkirk in 1811, for the purpose of planting a colony. In the deed of transfer, its boundary-line is defined to 'begin at a point on the western shore of Lake Winnipeg in 52° 30′ N. lat.; thence running due west to Lake Winnipegoos; thence in a southerly direction, so as to strike its western shore in lat. 52° N.; thence due west to the intersection of the parallel of 52° N. lat. and the Assiniboine River; then due south to the height which separates the waters of Hudson's Bay from those of the Missouri and Mississippi; thence east along that height to the source of the Winnipeg, or the principal branch of the waters which flow to the mouth of the Winnipeg River; thence in a northerly direction to the middle of Lake Winnipeg, and thence west to the place of beginning. This boundary was, however, curtailed some time afterwards, by the claim of the United States to all the land south of lat. 49° N. The western portion of the original tract is one bleak plain, with a few shrubs scattered here and there, and devoid to a great extent of irrigating streams; while the eastern side presents a varied landscape of hill and dale, the latter low, level, and marshy, and both well wooded. The winters are long, dreary, and excessively cold, the thermometer sometimes reaching —45° F., rising in summer to 95° or 105° in the shade. The climate is nevertheless very healthy, the only prevalent diseases being those which are induced by sudden changes of temperature. The land under cultivation is extremely productive, and the natural pasture in summer affords splendid facilities for the breeding of horses, sheep, and cattle. A number of the colonists are buffalo hunters, and others resort to the lakes Winnipeg and Manitoba, where they gain a subsistence by fishing in these inexhaustible waters. The first settlers were emigrants from the north of Scotland, who spoke Gaelic, and professed Presbyterianism. They were joined by 100 Canadian veterans and a fresh colony of Scotch in 1815; and subsequently by French Canadians, French-Indian and English-Indian half-breeds from the territory of the North-west Company, and a few immigrants of other nations. The colonists, after having been brought almost to the verge of ruin from the attacks of the North-west Company, the extreme severity of winter, inundations by the swollen waters of the Red River, a visitation of grasshoppers, and intestine trouble, are now enjoying a reasonable share of prosperity. The population in 1857 was 6522, of whom the Canadians and Scotch are chiefly agriculturists, and the half-breeds hunters, fishers, &c. Horse-breeding is extensively carried on, and the produce are in considerable demand; but the settlement

has very little import and export trade, the latter consisting chiefly of flour, which is purchased at a fair rate by the Hudson's Bay Company. While the proposed transfer to the crown (autumn and winter of 1869—1870) of the rights of the Hudson's Bay Company was pending, the R. R. settlement was the scene of much contention and violence. The hasty action of the Canadian authorities incensed the French-speaking population, who, led by Louis Riel, organised a force, imprisoned their opponents (English and Scotch), seized on Fort Garry, established a provisional government, robbed the strong-box, and dictated terms to the governor of the H. B. Company to which he was obliged to submit. In July, 1870, a military force suddenly appeared in the province, and Riel, fearing capture, escaped, and thus closed the insurrection.

RED ROOT (*Ceanothus*), a genus of plants of the natural order *Rhamnaceæ*, consisting of deciduous shrubs with simple alternate leaves and large red roots, whence their common name. The common Red Root of North America (*C. Americanus*), which abounds from Canada to Florida, is a shrub of 2—4 feet high, with beautiful thyrsi of numerous small white flowers. It is sometimes called *New Jersey Tea*, because an infusion of the dried leaves is occasionally used as tea, and was so especially during the American War of Independence. The plant is also used for dyeing wool of a cinnamon colour. A strong infusion of the leaves has been found useful in aphthous affections, in the sore throat of scarlet fever, and in dysentery. —A number of species are found in different parts of North America, some of them very beautiful, especially *C. azureus*, a Mexican shrub, with elongated thyrsi of brilliant blue flowers. Some of the species grow very well in Britain; the Mexican ones require protection from frost in winter.

RE'DRUTH, a town of Cornwall, consists chiefly of one long street, which stands on a hill, in the centre of a famous mining district, 9½ miles north-west of Falmouth. Iron foundries are in operation; but the principal product of this vast mining district is copper. In the vicinity are many mines, which are worked by large steam-engines. By railway, there is easy communication to St Ives and Falmouth Bays. Pop. (1861) 7919.

RED SANDSTONE was the term formerly applied to the combined Devonian and Permian rocks, when their relations to the Carboniferous strata were unknown. The discovery that one set of the red sandstone was below the coal, while the other was above it, caused their division into the Old Red (q. v.), or Devonian, and the New Red, or Permian (q. v.). For some time after this division, the original term Red Sandstone was retained by a few geologists to characterise the newer set of red rocks, but it is now quite given up.

RED SEA, or ARABIAN GULF, an inlet of the Indian Ocean, in form a long and narrow gulf, stretching north-west from the Strait of Bab-el-Mandeb (lat. 12° 40′ N.), by which it communicates with the Gulf of Aden, to the Isthmus of Suez (lat. 30° N.), which parts it from the Mediterranean Sea. It separates Arabia on the east from Egypt, Nubia, and Abyssinia on the west. Its extreme length is over 1400 English miles; it varies greatly in breadth—from about 20 miles at the Strait of Bab-el-Mandeb, to upwards of 230 at about lat. 16° 30′. At Râs (Cape) Mohammed (lat. 27° 40′ N.), the sea is parted into two arms or smaller gulfs, which enclose between them the peninsula of Mount Sinai; that on the west, continuing the direction of the main body of the sea, is the Gulf of Suez (Bahr-es-Suweis), of which the Strait of Jubal or Jubbah forms the entrance; its length is about 180 miles; extreme breadth (about lat. 29°) upwards of 30. The eastern arm, called the Gulf of Akabah (Bahr el-'Akabeh), is entered by the Straits of Tiran, and runs north-north-east to lat. 29° 30′ N. Its length is upwards of 100 miles; greatest breadth, rather more than 15. The depth of the R. S. varies considerably, but is in many places very great; the deepest soundings recorded are 1054 fathoms, in lat. 22° 30′, and of 16, it is comparatively shallow, but the shallowest part of the whole Sea is the Gulf of Suez, which decreases in depth from 40 or 60 fathoms at the entrance to 3 fathoms in Suez Harbour, at the northern end, where the Gulf, which is supposed in ancient times to have extended considerably further north, has apparently been filled up by the sand washed up by the strong tides, or drifted in by the winds. The Gulf of Akabah is much deeper; it is, in fact, a narrow, deep ravine, with steep and rocky sides, forming the termination of the long valley of the Arabah, running northward to the Dead Sea. The basin of the R. S. itself is the lowest portion of a deep valley lying between the highlands of Africa on the west and the bare plateau of the Arabian hills on the east, which latter, rising at some little distance inland, leave for the most part a sandy and sterile tract along the sea. The navigation of the R. S. has always been accounted difficult and dangerous, owing to the prevalence of violent winds, and the number of islands, shoals, and coral reefs, which line the shores. These coral reefs extend generally in parallel lines along the coast; they abound in all parts, but are especially frequent on the Arabian side, where the navigation is consequently very intricate. The coral is very beautiful, often red or reddish in colour, but more commonly white. The islands generally occur singly, but between the parallels of lat. 15° and 17°, they are found massed in two groups—the Farsan (q. v.) Islands on the eastern, and the Dhalac (q. v.) Islands on the western side. In mid-channel, south of Ras Mohammed, there is generally a width of 100 miles clear. Along this channel, the winds are constant throughout the year in one of two directions: from May to October, the north-west monsoon blows; for the rest of the year, the south-east is the prevailing wind, and the water in the northern part of the Sea is then raised to a higher level than the Mediterranean. It had been generally supposed that the level of the R. S. was more than 30 feet higher than that of the Mediterranean, but it is now known, from careful observations, that the levels of the two seas are really the same. The principal ports are, on the Arabian side, Mocha, Jeddah (the port of Mecca), and Yembo (the port of Medinah); on the west, Suez, Cosseir, Suakin, and Massowah. The origin of the name R. S. has given rise to a variety of conjectures, and has never yet been satisfactorily settled. It is supposed to have been so called from the name Edom (Red), as the mountains of that country are washed by the waters of the Gulf of Akabah; from the red and purple colouring of the rocks which in some parts border it; from the red colour sometimes given to the waters by animalcules and sea-weed; or from the reddish tinge imparted to them in some places by the subjacent red sandstone and reddish coral reefs. To the Hebrews, it was known as Yam *Suph*, the sea of *weeds* or *sedge*. By the Greeks, in the earliest times, the name R. S. was given to the whole of the Indian Ocean, including both the R. S. and the Persian Gulf, and not distinguished to the former (which was then and afterwards known as the Arabian Gulf), though the name is

later times, gradually became restricted in its application.

From the earliest times, the R. S. has been a great highway of commerce between India and the Mediterranean lands, and traversed successively by Egyptians, Phœnicians, Hebrews, and Arabs. It is first mentioned in the Book of Exodus, on occasion of the passage of the Israelites, which is supposed to have taken place a little south of the present town of Suez. The first recorded navigation of the Sea was in the time of Sesostris, in the 14th c. B.C. Three centuries later, Hebrew and Phœnician ships traversed the R. S. on the voyage to Ophir, from the port of Eziongeber, at the head of the Gulf of Akabah. The Gulf of Suez was for many centuries apparently the seat of the Egyptian trade in this sea and to India. After the foundation of Alexandria, and during the dynasty of the Ptolemies and the Roman dominion, the trade with India was vigorously carried on, though the chief seat of traffic was moved further southward, to the towns of Berenice and Myos Hormos, which sent out annually large fleets to India. After the establishment of the Mohammedan empire in the 7th c., an important trade with India and China seems to have been carried on through the R. S.; and through it, in the period between the 12th and 15th centuries, the goods of the East passed to the Venetian factories in Alexandria, until the discovery of the route round the Cape of Good Hope diverted the traffic with India into a different channel, and put an end to the commerce of the Red Sea. Since the establishment of the so-called Overland Route to India, and opening of the Suez Canal, the R. S. has more than regained its ancient importance as the highway of commerce between Europe and the East. See SUEZ.

For the classical geography of the R. S., the *Geographi Græci Minores* of Müller (Paris, 1855), and the Atlas appended to it may be consulted. Fuller information on the subject of the R. S., its coasts, and adjacent lands, will be found in the elder Niebuhr's *Travels*, and *Description of Arabia;* in the *Travels* of Salt, Burckhardt, Rüppell, and others; in Wellsted's *Observations on the Coast of Arabia, &c.;* in Ehrenberg's work on the Coral Islands of the R. S.; Ritter's *Erdkunde*, vol. ii.; and the Admiralty Chart, based on the surveys of Moresby, Carless, and others.

REDSHANK. See SANDPIPER.

REDSHID PASHA, a celebrated Turkish statesman, and long the chief of the party of progress in Turkey, was born at Constantinople about 1800. He accompanied his brother-in-law, the governor of the Morea, into Greece, and after his death, obtained the post of chief secretary in one of the government offices at Constantinople. On the outbreak of the Russian war (1828—1829), he was charged with a mission in Bulgaria, and exerted himself effectually to protect the Christian subjects of the Porte from the fanatic rage of their Moslem neighbours; and on his return obtained from Mahmoud, who fully appreciated his character, a post in the foreign office. On the creation of resident representatives at foreign courts, R. was sent to the courts of France and Britain, and applied himself diligently to the study of the language, manners, and political constitution of these countries; but was recalled in 1837, and nominated grand-vizier. His persuasive eloquence and firmness of character greatly aided the sultan in carrying out his plans for the better centralisation of the administration, and for mercantile intercourse with foreign nations; but the old Turkish party were still too strong for him, and he was compelled to resign office, and return to Paris and London to support the Turkish against the Egyptian interests. Recalled by the death of the sultan, and the disaster of Nisib, to his old post, the foreign office, he succeeded, after a debate in council of three days' duration, in obtaining the hattisherif of Gulhane (3d November 1839), a species of constitutional charter, which, from the comparative weakness of its promoters, became a dead letter. The effects of his foreign diplomacy were soon apparent in the humiliation of the Egyptians in Syria; but a seraglio intrigue, which occasioned his dismissal, deprived him of the honour of concluding peace. From 1841 to 1845, he was the Turkish representative at the French court, and though recalled to fill the post of grand-vizier (28th September 1846), he found his influence at court greatly diminished under the new sultan. He was vigorously supported by Sir Stratford Canning, the English ambassador, who was of the opinion that all hopes of a bright future to Turkey depended solely upon Redshid Pasha. He was frequently deposed, and almost immediately recalled, according as the anti-reform party gained or lost the ear of the sultan; but the complications with Russia, which arose in 1853, threw the anti-reformers (who had counselled an obstinate disregard of all the Russian representations) into discredit, and R., more powerful than ever, was again recalled to the direction of foreign affairs. In 1854, he was again overcome by his political opponents, and retired from office, which he did not resume till after the peace of Paris. His reappointment as grand-vizier excited great hopes of further salutary reformations; but the French influence at the Porte was pertinaciously antagonistic, and he was twice forced to resign, and as often recalled. At last, worn out with harassing cares and toil, he was seized with an illness, to which he speedily succumbed, at his palace of Emmirgian, 7th January 1858. Though a Turk, he was one of the most enlightened men of his time, and was well versed in foreign languages, general literature, and science.

RED SNOW. The apparent redness of snow, as seen from a distance, is often an effect of light, which adds a peculiar charm to mountain and winter landscapes, particularly in the mornings and evenings, when the rays of the sun fall most obliquely on the surface of the snow. But snow is occasionally found both in polar and alpine regions of a really red colour. This phenomenon seems to have been observed by the ancients, as a passage in Aristotle apparently refers to it; but it attracted no attention in modern times till 1760, when Saussure observed it in the Alps, and from chemical experiments concluded that the red colour was owing to the presence of some vegetable substance, which he supposed might be the pollen of a plant. The next observations on red snow were made in the arctic expedition under Captain Ross, when it was found extending over a range of cliffs on the shore of Baffin's Bay for eight miles, and the red colour penetrating the snow in some places to a depth of 12 feet. On the return of the expedition in 1819, the colouring matter, as then existing in the melted red snow, was subjected to careful examination by Robert Brown and by Francis Bauer, the former most eminent botanist pronouncing it to be an unicellular plant of the order *Algæ*, whilst the latter referred it to *Uredo*, a genus of *Fungi*, and called it *U. nivalis*. Baron Wrangel afterwards declared it to be a *Lichen*, and called it *Lepraria Kermesina;* but Agardh and Dr Greville of Edinburgh—the latter of whom obtained specimens from the Scottish island of Lismore—on further examination, returned to the opinion of Brown, an opinion

which has since been fully confirmed, and the plant is generally known by the name *Protococcus nivalis*, given to it by Agardh, or *Palmella nivalis*, given to it by Sir William Hooker. The motions of this microscopic plant in the earlier stages of its existence have led some observers, and among them eminent naturalists, to regard the organisms which they found in red snow as animalcules. See PALMELLACEÆ. But whilst no doubt is now entertained of its real nature, it is not impossible that animal as well as vegetable life may exist in red snow, and that real animalcules may have been observed. The red snow plant consists, in its mature state, of brilliant globules like fine grains, seated on, but not immersed in, a gelatinous mass.

REDSTART (*Phœnicura rutecilla*, or *Ruticilla phœnicura*), a bird of the family *Sylviadæ*, nearly allied to the Redbreast, but having a more slender form and a more slender bill; the male in summer having the head, back, and wing-coverts gray, the forehead white, with a narrow black band at the base of the bill; the throat, sides of the neck, and face jet black; the wings brown, the tail and upper tail-coverts bright rufous chestnut, with a strip of dark brown on the centres of the two middle feathers; the rest of the under-parts mostly pale chestnut. The female is grayish-brown, with neither the white

Redstart (*Ruticilla phœnicura*).

nor the black on the head, and less red on the tail. The R. is widely diffused over Europe, Asia, and the north of Africa. It appears in Britain as a summer bird of passage, and is found in almost all parts of the island. It is a bird of very lively manners, remarkable for the way in which it flits about, in and out of some hedge or bush, where it is in quest of insects. It has a very soft melodious song, which is continued during the breeding-season far into the night, and resumed at early dawn. In confinement it becomes very tame, and has been known to imitate the song of other birds, and even to learn a tune.—The AMERICAN R. (*Setophaga ruticilla*) is a small Fly-catcher, of the family *Tanagridæ*, subdivision of wood-warblers, common in most parts of North America, a bird of great beauty, and extremely active in its movements. It breeds from Pennsylvania northwards.

REDU'CTION, in Arithmetic, is the conversion of a quantity in one denomination to an equivalent one of a different denomination. In the reduction of a quantity from a higher to a lower denomination, the process of multiplication is employed; and, contrarily, division is the needful process when a number of a lower denomination has to be reduced to an equivalent number of a higher.

REDUCTION, in Scotch law, means the annulling or setting aside of a deed or instrument, and thereby annihilating its legal effect. The action of reduction commences with a summons requiring the defender to bring the deed into court to be set

needs, stating the reasons of objection. The defender, if he defend the action, refutes the reasons, which implies that he intends to support the production, i.e., to produce the document and adhere to its validity. The action can be raised only by a person who has some title or interest connected with the matter.

REDUCTION OF METALS. A metal is said to be reduced to its metallic state when it is separated from the condition of a chemical compound in which it exists as an ore. This is generally effected either by the direct action of heat, or by heating the ore mixed along with a reducing agent. Thus, when oxide of mercury is simply heated, the oxygen is given off as gas, and mercury or quicksilver appears as metal. Again, when sulphuret of lead is heated with iron, sulphuret of iron is formed, and the lead is reduced to its metallic state. In this case, the iron is the reducing agent. The principal reducing agent employed in metallurgy is carbon, or rather the gas carbonic oxide, which is formed under certain conditions when carbon is burned. See METALLURGY, IRON.

REDUIT, in Fortification, is a central or retired work within any other work, intended to afford the garrison a last retreat when they can no longer hold the outer works. It is commonly of masonry, bastioned and often circular. Many engineers doubt the use of reduits altogether, as blocking up the work upon which they themselves are stationed for the men, and incapable of protracted defence, while they frequently mask the fire of other works more to the rear.

RED-WATER, also known as Bloody Urine, Moor-ill, and Hæmaturia, is a disease of cattle, and occasionally of sheep; it depends upon the eating of coarse indigestible nutritive food, or continued exposure to inclement weather, and on other such causes, which lead to a deteriorated state of the blood. In England and Ireland, it affects cattle of all ages and of both sexes, but in Scotland it is most common amongst milch cows within a fortnight after calving. The appetite and ruminations are irregular, the bowels speedily become constipated, and the urine reddened with the broken-down red globules of the blood. In the more advanced stages of serious cases, the urine is black. A dose of physic must at once be given, and for an adult animal may consist of ½ lb. each of common and Epsom salt, 3 ounces of sulphur, and a pound of treacle, mixed together in two bottles of water. Food should be withheld, and the food consist of scalded bay with a little cake. A full supply of pure water is further essential. Weakness, which is apt to supervene, may be warded off by giving several times daily two ounces each of gentian and ginger in a quart of ale. To prevent red water, attend to feeding and watering, place rock-salt in the pastures and yards, and, as has been successfully done in Cheshire and other English counties, improve the grazing lands, notorious for the production of the disease, by draining, liming, and manuring, and where these means are ineffectual, by ploughing them up, and cropping them for a few years.

RE'DWING (*Turdus pheniceus*, called also Swamp-Blackbird, an abundant species of the family of *Icterodæ* living mostly in North America. It breeds throughout the country from lat. 55° northwards, and in autumn collects in great flocks and migrates southwards to the coasts and islands of the gulf. It is black, with crimson epaulettes. Its note is musical. Also a species of Thrush (sp. v.), (*Turdus iliacus*), a British winter bird of passage, whose range extends from northern Europe and Asia to the Mediterranean. In size, it is about equal to the Song Thrush. The general colour is a rich chocolate-

The R. arrives in Britain rather earlier than the Fieldfare (q. v.), and, like it, congregates in large flocks. It has an exquisite song, which it pours

Redwing (*Turdus iliacus*).

forth from the summit of a high tree, gladdening the woods of the north.

RED-WOOD, the heart-wood of *Adenanthera pavonina* (*Leguminosæ*), a large tree growing in India, where it is called *Rukta-chundun*, and is much used in dyeing red. Small quantities are brought to this country for the same purpose, but it is not in much demand.

REE, Lough, a lake in the middle of Ireland, between Connaught on the west and Leinster on the east, is an expansion of the river Shannon (q. v.).

REED, the common English name of certain tall grasses, growing in moist or marshy places, and having a very hard or almost woody culm. The Common R. (*Phragmites communis*, formerly *Arundo Phragmites*) is abundant in Britain and continental Europe, in wet meadows and stagnant waters, and by the banks of rivers and ditches. It grows chiefly in rich alluvial soils. The culms are 5—10 feet high, and bear at the top a large much branched panicle, of a reddish-brown or yellowish colour, having a shining appearance, from numerous long silky hairs which spring from the base of the spikelets. The two outer glumes are very unequal; and the spikelet contains 3—4 perfect florets, with a barren one at the base. The culms, or stems, are used for making garden-screens, for light fences, for thatching houses and farm-buildings, for making a framework to be covered with clay in partitions and floors, for battens of weavers' shuttles, &c. So useful are reeds in these ways, and particularly for thatching, that it is found profitable in some places to plant them in old clay-pits, &c. Probably they might be planted with advantage in many peat-mosses, where they are now unknown. The plant is not very common in Scotland; but in the fenny districts of the east of England, it covers large tracts called *reed-ronds*, and similar tracts occur in many parts of Europe.—Nearly allied to this is *Arundo donax*, the largest of European grasses, plentiful in the south of Europe, and found in marshy places as far north as the south of the Tyrol and of Switzerland. It is 6—12 feet high, and has very thick, hollow, woody culms, and a purplish yellow panicle, silvery and shining from silky hairs. The woody stems are an article of commerce, and are used by musical instrument makers for reeds of clarionets, walking-sticks, and fishing-rods. *Arundinaria macrosperma* forms immense cane-brakes in the southern Mississippi Valley States. — *Arundo Karka* is supposed to be the grass called *Sur* in Sinde, of which the flower-stalks are very fibrous; and the fibres, being partially separated by beating, are twisted into twine and ropes. — The Sea Reed is *Ammophila* (q. v.) — or *Psamma — arundinacea*.

REED. See Loom.

REED, in Music, the mouthpiece of a hautboy, bassoon, or clarionet. Also, a piece of metal with a brass spring or tongue attached to it in such a way that the admission of a current of wind causes it to vibrate and sound a musical note. The reed is of two kinds, the *beating* reed and *free* reed. The former is used in the reed-pipes of an Organ (q. v.), and requires to be placed within a tube in order to produce a musical sound. It consists, as in fig. 1, of a metallic cylinder *a*, with the front part cut away, and a brass spring or tongue *b*, placed against the opening, and attached at the upper end. The admission of air to the pipe in which the reed is placed causes the tongue to vibrate against the edge of the opening, so as to cover and uncover the slit, through which the air passes to the pipe above, the regularly repeated beat producing a musical note, dependent for its pitch on the length of the tongue, which is regulated by a strong spring of wire *c*, pressing against it. The quality of the sound is determined to a large extent by the length and form of the pipe in which the reed is placed. The *free* reed differs from the beating reed in this, that the tongue is a little smaller than the opening, and strikes, not the edge of the opening, but the air. The admission of a current of wind causes it to yield so as to let the air pass, while, after recovering its position, it is carried back by its momentum equally far on the other side, and continues vibrating so long as the current of air is continued, the result of the pulsations being a musical note. The invention of the free reed has been ascribed to M. Grenié, a Frenchman, who brought it into use, but it has been long known to the Chinese. Its note is more smooth and mellow than that of the beating reed, and it has the advantage of not requiring a pipe, which is a necessary appendage to the latter. Besides being occasionally adapted to organ-pipes, it is used without a pipe in the Harmonium (q. v.), as represented in the subjoined fig. 2, where *a* is the brass frame containing the slit, *b* the reed in the frame, while *c* represents the position of the reed in the instrument, it being a little below the slit, when not in motion.

REED MACE. See Typha.

REED WARBLER. See Warbler.

REEF, in Naval matters, is a portion of a sail included between the bottom of the sail and a parallel row of eyelet-holes a short distance above it, or between such row of eyelet-holes and a parallel row higher up. The object of the reefs is to reduce the size of the sail when the wind becomes boisterous. For this purpose, cords are inserted at each eyelet-hole, which, when the sail is unreefed, hang freely. When the intention is to take in a reef, the sail is slightly lowered; the men climb out along the yard or boom below its lower edge, fold the loose sail on the yard, and fasten the reefing-lines securely round the yard and sail thus

folded. There are also systems of small ropes in some ships by which the sail may be reefed from the top without the men incurring the danger of going out on the yard during tempestuous weather.

REEL, a lively dance peculiar to Scotland, which may be danced by two couples, but admits a greater number. The music is in general written in common time of four crotchets in a measure, but sometimes in jig time of six quavers.

REEL-WINDING MACHINE, a beautiful contrivance, now used by the manufacturers of sewing-thread. It is for the purpose of winding the thread on to the reels upon which it is sold for use; and not only does it turn a number of reels round so as to wind the cotton upon them, but, by a peculiar arrangement, every turn is so managed that the cotton is reeled with the most beautiful regularity, each turn of the thread being laid on by the side of the previous one, and never crossing it.

RE-ENTERING ANGLE, in Fortification, is an angle in the line of works of which the apex points away from the front. As an example, the flanks of a bastion make re-entering angles with the adjoining curtains. Advantage is commonly taken of the comparatively sheltered position of these angles to form *places d'armes* for the assembly of troops.

RE-ENTRY is a legal term used in leases, whereby the landlord stipulates for power to re-enter the premises in certain conditions, such as the non-payment of rent after the lapse of a specified period from the time it became payable. Before, however, the power of re-entry can be exercised, all the conditions must be strictly complied with.

REEVE (Sax. *gerefa*, Ger. *graf*), a magistrate existing in early times in England and elsewhere in Northern Europe, whose duties were at first principally fiscal. In the Saxon period in England, he represented the lord of a district, whether township or hundred, at the folkmote of the county; and within his district, he levied the lord's dues, and performed some of his judicial functions. The word still survives in the shire-reeve or sheriff (*scyr-gerefa*), who was at first assessor to the ealdorman or earl, who, along with the bishop, presided, but afterwards became himself the presiding officer. Similar functions were exercised in boroughs by an elective officer called the Portreeve. In Anglo-Saxon times all the English boroughs were subject to the rule of a portreeve, for whom the Norman conquerors substituted a bailiff, who, in the larger towns, was allowed to assume the appellation of mayor.

REEVE, a verb used in speaking of ropes, signifies the passing of a rope through any hole, deadeye, block, or pulley, in conjunction with which it is to be used.

REFERENCE, as a legal term, means the sending by a court, or by agreement of the parties, the decision of a matter to an arbitrator, or to an officer of the court or master. In cases where parties, without going the length of commencing litigation, agree to arbitration, they usually execute a deed or agreement of submission; but after litigation has begun, if the judge think it would be better that an arbitrator should settle the dispute, an order of reference is drawn up for that purpose.

REFERE'NDARY, a name given in the early kingdoms of Europe to a public officer, whose duty was to procure, execute, and despatch diplomas and charters. The office of Great Referendary to the monarchy of France merged eventually in that of Chancellor.

REFINING OF METALS. The [illegible] connected with the [illegible] of copper, tin, lead, and some other metals is mostly called the refining process. With copper, for example, the impure or 'blister' copper containing from 4 to 20 per cent. of the metal alloyed usually with small quantities of iron, tin, arsenic, &c. is melted in a reverberatory furnace, and exposed to the oxidising influence of the air. By this means the foreign metals generally become oxidised, and rise to the surface in slag, which is skimmed off; the oxide of copper formed during the process being afterwards reduced to the metallic state by throwing coal on the surface of the melted metal, and stirring with a pole of green wood. The disengagement of gases from the wood during the 'poling' causing the metal to splash about, and so expose every particle of it to the reducing action of the coal, thus the oxide of copper is deprived of its oxygen, and the copper obtained nearly pure.

Tin is also refined by throwing billets of green wood into it while in a melted state, which has the effect of bringing impurities to the surface as dross, in a somewhat similar way to the oxidising of foreign metals in copper. See Tin.

Lead is purified from antimony and tin by an analogous mode of oxidation, and silver is separated from it by a special process. See Lead.

The refining of iron is a name applied to the process for partially separating the carbon from cast iron, and is described under Iron. Of the less important metals used in the arts, zinc, antimony, and mercury do not usually undergo any special refining process; aluminium, it is said, will not afterwards purify when once reduced to the metallic state; and nickel, of which German silver is largely composed, is refined by a process or processes kept strictly secret by manufacturers.

We may state here that no metal is ever quite pure in its commercial state, even though it has gone through the usual operation of refining, but all are to a certain extent alloyed with certain others. For the great majority of purposes, it is not necessary that metals should be chemically pure, and when it is, they can only be made so by refined chemical processes.

It will be readily understood, however, that it is always necessary to carry the refining of gold and silver further than the less valuable metals. To render gold sufficiently pure for conversion into coin, an ingenious process has, within the last few years, been proposed, by which fused gold is mixed with about 10 per cent. of black oxide of copper, and then stirred so as to oxidise any foreign metals which happen to be present. The oxide of copper does not fuse, but is disseminated through the melted metal, and oxidises any tin, antimony, or arsenic, and causes them to rise to the surface, so that they may be skimmed off. Perfectly pure gold is prepared by dissolving the metal in aqua regia—a mixture of nitric and hydrochloric acids—and precipitating silver (with which it is almost always alloyed) as well as any other foreign metals by chemicals which have no action on the solution of gold. The metallic gold is afterwards precipitated as a finely-divided powder, by a salt of iron, and is then fused and cast into bars.

Silver is rendered pure by dissolving it in nitric acid, filtering the solution, and then precipitating the metal with common salt as a chloride of silver. This is afterwards mixed with sulphuric acid, and then, by introducing bars of zinc, a chloride of zinc is formed, whilst the silver is reduced to the metallic state.

REFLE'CTION. See Catoptrics. Heat. Undulatory Theory. In the articles referred to, the laws of reflection are stated, illustrated

geometrically, and deduced from the modern theory of the nature of light and radiant heat.

We may now *mention* one or two curious circumstances connected with reflection, which could not well be given in any of these articles.

In general, a reflected ray is more or less *polarised* (see POLARISATION); and if the reflecting surface be metallic, or if it be formed of a substance of high refractive index, as diamond, it is in general *elliptically* polarised.

In various cases, principally known by the laborious investigations of BREWSTER (q. v.), the *colour* of the reflected light not only differs from that of the incident light, but is different for different angles of incidence, and for different azimuths of the plane of reflection. The theoretical explanation of these very singular facts has not been as yet very satisfactorily given. In fact, the problem of reflection from the surface of a metallic or a crystalline substance is one which presents difficulties of a very formidable kind, principally from the want of definite data for the formation of a satisfactory fundamental hypothesis; and, in a secondary manner, from the intricacy of the requisite mathematical investigations.

RE'FLEX ACTION. See NERVOUS SYSTEM.

REFORM, PARLIAMENTARY, the name generally given to the acts which passed the legislature of the United Kingdom in 1832, by which an extensive change was made in the system of parliamentary representation. Parliamentary reform had for many years before been a topic of popular agitation. So far back as 1782, a motion by Mr Pitt for a reform of the franchise was lost by a majority of 20, and similar motions in the years 1783 and 1785 by majorities of 44 and 74. The horror inspired by the excesses of the French Revolution caused a reaction, and the repression for a time of all liberal tendencies; and it was not till some time after the close of the French war that the desire for reform again manifested itself. Mercantile distress had added to the popular dissatisfaction, which was fomented by the revolutions of 1830 in France and Belgium; and an adjustment of the inequalities of the representative system, with an extended franchise, was looked forward to as a panacea for all the ills under which the community laboured. The demand for parliamentary reform became more imperious on the death of George IV. and accession of William IV. Meetings were held over all the country, and though there was no open rioting, a constant alarm was kept up. On the resignation of the Duke of Wellington, November 16, 1830, the celebrated Reform ministry of Earl Grey came into office. Parliament assembled on February 3, 1831, and on March 1, Lord John Russell proposed his first scheme of Reform. After a long and animated discussion, the bill passed the second reading by a majority of 1. On the motion for a committee, General Gascoyne moved, as an amendment, that the number of representatives for England and Wales should not be diminished; and the amendment being carried by a majority of 8, the ministry abandoned the bill, and resorted to a dissolution. The cry arose through the country of 'The bill, the whole bill, and nothing but the bill;' and when the new parliament assembled on June 14, a large majority, including the whole of the county members for England, excepting four or five, were pledged to support the bill, which was again introduced on June 24, and passed the third reading in the House of Commons by a majority of 113. The Upper House, however, threw it out on the second reading by a majority of 41, and parliament was immediately prorogued. It reassembled on December 6, and on December 12 the third Reform Bill was introduced in the Commons by Lord John Russell, which did not, like the former bills, diminish the number of members—a concession which the Opposition considered as an improvement, and it had a majority of 116 on the third reading. In the Lords, the second reading was carried by a majority of 9, and the bill ordered to be committed. In committee, Lord Lyndhurst carried, by a majority of 35, a motion that the disfranchising clause should be postponed, and the enfranchising first considered; on which, the king having refused to accede to a creation of peers sufficient to carry the bill, the ministry resigned. A week of intense public agitation followed. The government were induced to resume office on the king granting them full powers to secure majorities by the creation of peers; but eventually that expedient was avoided by a sufficient number of Lords absenting themselves to leave ministers a majority on the third reading, when the bill passed by a majority of 84, receiving the royal assent by commission on June 7, 1832. Reform bills for Scotland and Ireland were immediately afterwards introduced and carried. For the details of the alterations made by these several measures on the distribution of members and the electoral qualification, see PARLIAMENT. The changes effected were so sweeping as to cause many of the advocates of Reform to be apprehensive that the balance of the constitution would be disturbed by the preponderance of the democratic element; but the determination of the masses was such, that the conservative influences of the country were powerless to stay or modify the measure. Yet no sooner was the contest at an end, than a reaction followed, falsifying equally the hopes of the supporters of the bill, and the fears of its opponents.

In 1854, a new Reform Bill was introduced, but was withdrawn in consequence of the breaking out of the Crimean war. Another important change was made in the constituency of the House of Commons by the Reform Bill of 1867—68. The most important provision of the new act as regards England was that establishing household suffrage in boroughs, and occupation franchise in counties. The result of this act was an enlargement of the constituency from 514,026 in the boroughs in 1866 to 1,220,715 in 1868, and from 542,633 in the counties in 1866 to 791,916 in 1868, a total gain of 955,972 voters, or an increase of 90½ per cent.

REFORMATION. The *Reformation* denotes the great spiritual and ecclesiastical movement which took place in Europe in the 16th c., and as the result of which the national churches of Britain, of Denmark, Sweden, Norway, and Holland, and of many parts of Germany and Switzerland, became separated from the church of Rome. In other countries, such as Hungary and France, the same movement detached large portions of the population from the Roman Catholic faith, yet without leading to a national disruption with the papacy.

The causes of this movement were manifold; but, as may be supposed, they present themselves in very different lights to members of the different religious communions.

To Protestants, the Reformation appears as the natural result of causes which had long been at work, and which it needed but a fitting occasion to call into active operation. The church of Rome had gradually, from the 6th c., or the time of Gregory the Great, extended not merely its influence, but its direct control and government, over all the countries of Western Europe—in many places, as in Ireland, Scotland, and part of England, displacing the old national churches, which had been planted in earlier times, and which had

survived under comparatively simple forms of government. Although some uncertainty may exist as to the exact constitution, doctrine, and discipline of the old Scoto-Irish Church, there can be no doubt that it did not acknowledge the direct superintendence of Rome, and that it was only after a long and varying struggle, not terminating till the 12th c., that the popes fully established their authority, and set up over this ancient church a completed hierarchy connected with Rome. It is only by keeping this in view that some features of the Reformation can be clearly understood and appreciated.

The natural result of the wide-spread supremacy of the Roman Church was, that the spiritual aspects of the church became gradually more and more merged in its mere machinery of external government. Everything that could give power and efficiency to it as an institute was carefully watched and nursed; but when, in the course of the 15th c., and even earlier, spiritual life began to die out in the centre of this vast system of ecclesiastical government in Rome itself, the baleful effects of such spiritual decay speedily began to tell through all its borders. The growing corruption shewed itself in many forms—in a prevailing ignorance among the monks and higher clergy; in the perversion of ecclesiastical offices, and especially in the grossly materialistic abuse of spiritual privileges and censures. The ignorance of the monks is depicted in strong colours in the satires of Erasmus and Buchanan, and in such books as the *Epistolæ Obscurorum Virorum*. The great impetus which the friars had given to the papal power in the 13th c., had died out. They had sunk, from being zealous and active preachers, into bigots and mendicants, cumbering the ground. The secular clergy were hardly less corrupted; in many cases, the higher dignitaries of the church had no interest in the spiritual duties of their office, and gave themselves up entirely to the pleasures of a worldly life, or, at best, to the duties of political or military activity. The revival of the old classical literature in Italy—the spirit of what is called the *Renaissance*—accelerated this movement of spiritual decay. The papacy itself became half-pagan. The church was little cared for even as an organ of government; it was used as an engine of self-aggrandisement and the most extravagant luxury.

These general causes, however, might have proved inefficient to produce any such radical change as the Reformation; they had been long felt and deplored. Wycliffe in England, and Huss and Jerome of Prague had denounced, in the most vigorous manner, the prevalent abuses; they had excited a wide-spread popular interest, and even to some extent secured royal favour. But the overbearing power of the church proved too strong for the reforming spirit in its earlier manifestations. In the midst of his evangelical activity, Huss was betrayed, through the promise of a safe-conduct, into making his appearance at the Council of Constance in 1414. No sooner was he fairly in the power of the Council, than he was confronted with certain articles of abjuration; and refusing to submit without being convinced, he was, in defiance of the promise made to him, condemned to be burned as a heretic. The rising spirit of reformation was temporarily quenched in the flames which consumed the intrepid martyr of Bohemia. The Council did nothing effectual to repair the abuses which he had denounced. The church remained apparently strong after a temporary excitement and alarm.

In the meantime, however, throughout the 15th c., new seeds of preparation for the great work were everywhere ripening. The literary movement begun in Italy, was spreading in Germany, in England, and elsewhere. Reuchlin arose in Germany, Erasmus in Holland; England welcomed the latter as a student in the early reign of Henry VIII., while he was engaged in preparing his edition of the Greek New Testament. Various manifestations of spiritual life shewed themselves, especially in the Rhine country. The Brethren of the Common Lot took up in a more evangelical form the succession of the Brethren of the Free Spirit, whose teaching had degenerated into a species of spiritualistic pantheism. Gerhard Groot and Thomas à Kempis represent this comparatively evangelical tendency, and springing from them, various men—the best known of whom is John Wessel of Groningen—have been called 'Reformers before the Reformation.' If we add to these influences the internal political agitations of the Germanic empire—whose traditional opposition to the papacy was by no means forgotten—the growth of a healthy political activity in many of the great municipalities of the empire, we shall find abundant incitements to the Reformation in the social state of Europe, especially of Germany, and in the church in the beginning of the 16th century. It required only a definite spark to kindle the slumbering agitation, and this was not long wanting.

Whatever may be said of the doctrine of Indulgences as theoretically stated, it is not denied by the most zealous defenders of the institution that it has at all times been liable to the gravest abuse; and it so happened that at the period in question the abuse had risen to a scandalous height. (See INDULGENCE.) An agent of this system, of the name of Tetzel, a Dominican friar, came into Saxony in the year 1517, and established himself not far from Wittenberg, for the purpose of disposing of papal indulgences. He was a man of low and unscrupulous character, gifted with great volubility, and he carried on his traffic in a peculiarly offensive and shameless manner. Luther, who had been recently created a Doctor in the Holy Scriptures, and entered upon his career as a teacher in the university of Wittenberg, was roused to indignation by what he heard of the doings of this man. He saw the evil influence of the system upon the members of his own flock, and determined to raise his voice against it. 'God willing, I will beat a hole in his drum,' he exclaimed, with reference to the coarse vehemence with which Tetzel commended the value of his wares. He posted on the door of the church of Wittenberg his famous 95 theses, and thereby created such a popular excitement that Tetzel was silenced, and obliged to retreat from the field. This was the beginning of the Reformation in Germany. Luther's attention once aroused to the working of the papal system, he proceeded to examine it in different aspects, and the result was, that his resolution to assail it strengthened as he advanced. Neither cajoling nor threats, neither the bland softness of Cajetan, nor the blundering polemics of Eck, were of avail to silence him. A papal bull was at length fulminated against him; and he consummated his audacity by burning the bull at one of the gates of Wittenberg, on the memorable 18th December 1520.

About the same time, and without any concert whatever, a similar movement against the sale of indulgences took place in Switzerland. In 1520, the Franciscan friars, who had the charge of promulgating the indulgences there, were opposed by Zwingli, a preacher in Zürich. His opinions were declared to be heretical by the two great universities of Cologne and Louvain; but he declared himself unmoved by the voice of Catholic authority; the magistrates and people of the city supported him;

and the result was the active spread of the reforming spirit, not only throughout Zürich, but the neighbouring cantons of Schaffhausen, Basel, and Bern.

In the meantime, Luther advanced in his work. He addressed the 'Christian nobles' of Germany, loudly declaring that the time to rise against Rome was come. 'Talk of war against the Turk,' he cried; 'the Roman Turk is the fattest Turk in the world; Roman avarice the greatest thief that ever walked the earth; all goes into the Roman sack, which has no bottom, and all in the name of God too!' Step by step, he opened his eyes to the errors of the papacy, and no sooner reached a new conviction himself, than he launched it forth into the world. He pronounced against the Seven Sacraments, in favour of only three—Baptism, the Lord's Supper, and Penance. He contended for the use of the cup to the laity. His rapid writings—no fewer than three—in the same year, which he closed by burning the papal bull (1520), circulated in thousands, and were eagerly read. Nearly all Germany was aflame with the new spirit, and it seemed as if the empire would be wholly lost to the papacy.

The interposition of Charles V. produced at this crisis a temporary interruption in the progress of the Reformation. Charles was crowned Emperor of Germany in January 1521, and immediately summoned at Worms a diet of the sovereigns and states of the empire. The papal leaders exerted themselves to have Luther summarily condemned at the diet. They succeeded so far as to make the emperor issue an edict for the destruction of the reformer's writings; but the estates refused to publish it unless Luther was allowed an opportunity of meeting his adversaries, under safe-conduct, and answering before the diet to the charges preferred against him. Luther was accordingly summoned to meet the assembled authorities of Germany at Worms. He gladly and proudly embraced the summons. His journey thitherward was a kind of triumphal procession, so enthusiastically did the people, and even some of the priests, greet him along the route. He is said to have entered Worms chanting 'Ein feste Burg ist unser Gott'—the *Marseillaise* of the Reformation, as has been remarked. The same night, however, the intrepid monk was heard in an agony of prayer in his room, overwhelmed by the solemnity of his circumstances. On the afternoon of the following day, he made his appearance before the diet, and confronted its assembled statesmen and princes—a scene grand and striking in its features, which has been often painted. He was urged to retract; but he was immovable. In a speech, first in German, and then in Latin, he expressed his determination to abide by what he had written, and called upon the emperor and the states to take into consideration the evil condition of the church, lest God should visit the empire and German nation with His judgments. A direct answer was demanded from him whether he would retract or not. 'I neither can nor dare retract anything,' he replied, 'unless convinced by reason and Scripture; my conscience is captive to God's Word, and it is neither safe nor right to go against conscience. There I take my stand. I can do no otherwise. So help me, God. Amen.'

It was evident that Luther was not to be intimidated. He remained some days in Worms; but neither persuasion nor threatening availed with him. He received orders to depart; and in the end of April, he set out on his way home. As he left Eisenach a few days afterwards, and was passing through a narrow defile near the fortress of Altenstein, he was seized by two armed horsemen with attendants, carried to the neighbouring castle of the Wartburg, and there lodged in safety. This apparently violent seizure was the friendly act of his sovereign, Frederick of Saxony, to protect him from the destruction that his intrepid conduct was certain to have called down upon him had he remained at liberty. The ban of the empire had followed him, and temporary obscurity was his only safety.

The Reformation suffered, however, from the absence of his guiding hand. Carlstadt and others, when left alone at Wittenberg, gave the rein to many excesses. Reform seemed likely to merge into licence. The heart of Luther, after a year's residence in obscurity, was incontrollably stirred within him to be at his old post again, directing and controlling the spirit of innovation; and he returned to Wittenberg in March 1522. The lawless movement, however, which had received impulse, was not to be restrained. It broke out in many quarters. Social oppression and misery added to the flames of fanaticism. The peasantry rose in arms, headed by the Anabaptist Münzer, and the horrors of a civil war raged throughout Germany. Luther exerted all his influence to stem the unhappy tide of affairs; exhorted the nobles on one hand, and the peasants on the other; and at no part of his career did he shew a higher spirit and wisdom, although he has not always got the credit of this.

With his hands thus full of practical labour, he plunged at the same time into a violent controversy with Erasmus, which by no means reflected so much credit on him. Erasmus and he had hitherto, although in different ways, co-operated in the same cause; but they were men of such different spirit and temper, that a separation between them was inevitable. Luther had felt this for some time, but he was reluctant to come to an open breach. 'Do not join your forces to our adversaries; publish no books against me, and I will publish none against you,' he had said in a letter in 1524. On the publication, however, of Erasmus's treatise *De Libero Arbitrio*, Luther could no longer hold silence. He responded in the same year, 1525, by his counter-treatise, *De Servo Arbitrio;* and the war of words waged hotly and vehemently between them. Luther was not only hearty but violent in denunciation; his indignation sunk into coarseness, while the audacity of his logic plunged him into unguarded and even immoral paradoxes, which left him gravely open to the cold and telling sarcasms of his opponent. He was evidently himself little satisfied with the result, and even his warmest admirers cannot see much to admire in the spirit and zeal which he manifested on this occasion.

Hitherto, the Reformation had not received any legal establishment. Frederick of Saxony, while warmly protecting Luther and his followers, did not yet take any steps to displace Romanism by legal enactment, and set up in its stead a Reformed Church. This was now done, however, by Frederick's successor. He commissioned Luther and Melanchthon to prepare a new form of church government and church service for his dominions. His example was followed by the other princes and states in Germany that had renounced the papal supremacy. The Reformation thus obtained substantive existence and civil support. It was no longer merely a spiritual movement, it became henceforth also a political power. This important result shewed itself conspicuously at the Diet of Spires in 1526. An endeavour made at this diet to suppress the new religious movement, and to insist upon the rigorous execution of the papal sentence against Luther and his followers, was successfully opposed by a majority of the princes and representatives of state; and it was resolved, on the contrary,

that the princes should have full power to order ecclesiastical affairs in their own dominions as they thought proper. This resolution served greatly to extend the Reformation. The emperor was too busy for some years with his own affairs to be able to interfere with the course of events; and the reforming cause was in the meantime greatly strengthened and advanced in various states of Germany.

This period of progress and tranquillity, however, was soon interrupted. A new diet was convoked at the same place in 1529; and under the more powerful influence of the papal party, backed by the presence of the emperor's brother, who presided in the diet, the measures of the former diet were recalled, and all changes in religion declared to be unlawful except such as might be authorised by an approaching General Council. It was then that the Elector of Saxony, the Landgrave of Hesse, and other princes of the empire who had already embraced the Reformation, and established it in their dominions, made a solemn *protest* against the action of this diet—a circumstance which gave rise to the name of *Protestants*, which has since attached to all the followers of the Reformation. See PROTESTANT.

While the Reformation thus ran its course in Germany, and was adopted by the civil authorities in many states, it was making corresponding progress in Switzerland, and there at length also, after a famous and elaborate conference held at Bern in 1528, under the countenance of the civil authorities, the supremacy of the pope was abolished, and the Reformed doctrines, in even a broader and more definite shape than in Germany, were declared to be the only doctrine of Scripture. Bern, Zürich, and Basel continued to be the main centres of the reformed movement in Switzerland; but the reformed doctrines gradually extended throughout the great majority of the cantons. Chiefly those surrounding the Lake of Lucerne remained, as they remain to this day, strongly attached to the Roman Catholic faith. The chief point of difference between the reformers in Switzerland and Germany concerned the doctrine of the Eucharist. Luther, while abandoning the doctrine of a literal conversion of the bread of the Eucharist into the body of Christ, known under the name transubstantiation, held to a modification of this doctrine, under the name of consubstantiation. The bread did not become the body of Christ literally, but it contained the body of Christ. Christ was in the bread as really 'as the sword in the scabbard or the Holy Ghost in the dove.' Zwingli, on the contrary, and his co-reformers in Switzerland, discarded all outward presence of Christ in the Eucharist. The service, in their view, was merely memorial. 'It is the spirit that quickeneth; the flesh profiteth nothing:' a passage which they applied to prove the worthlessness of any supposed eating of the body of Christ, even if such a thing were possible.

The dispute which arose on this subject between the reformers of Germany and Switzerland, and especially between their respective leaders, Luther and Zwingli, proved a serious impediment to the cause. Philip of Hesse sought to bring about a reconciliation between them. Zwingli, Bucer, and Oecolampadius met with Luther and Melanchthon at Marburg in the year 1529, on his invitation, and held a long conference, but without any result. Luther was not to be moved in a matter which he held to be of the very essence of the Christian faith. The combatants separated with their opinions unchanged.

When Charles V. perceived the firmness of the Protestant princes in the position which they had taken up, he became anxious for temperate and conciliatory measures. In an interview with the pope at Bologna, he urged, but without success, the necessity of a General Council, and at the same time took means to convene personally with the princes at a new diet to be held at Augsburg. In the view of this important convention, the reformers prepared, at the instance of the Elector of Saxony, a statement of their special doctrines. The basis of this, the famous *Confession of Augsburg*, was seventeen articles, delivered by Luther to the elector at Torgau, which had been adopted at a conference at Schwabach in 1529. These articles, enlarged and polished by the careful and moderate pen of Melanchthon, were submitted in twenty-eight chapters to the diet which met at Augsburg in June 1530. Twenty-one chapters were occupied with the statement of the opinions of the reformers, and the remaining seven devoted to an exposure of the errors of popery. The reading of this Confession by the Chancellor of Saxony, in name of the Protestant states, made an earnest and favourable impression upon the diet. The papal authorities submitted a reply, which was approved by the emperor, and ordered by him to be accepted as a conclusion of the religious differences which had arisen. The Protestants responded instead by an answer to the papal document, which was afterwards expanded by Melanchthon, and published under the title of *Apology for the Confession of Augsburg*.

The religious schism between the emperor and many of the states of Germany seemed now approaching a crisis which could only terminate in war. A renewed decree, exceeding in severity that of Worms, was launched against the reformers. They on their part appreciated the solemnity of the crisis, and met, headed by the Elector of Saxony, first at Smalkald, and then at Frankfurt, in the years 1530 and 1531, when they entered into a treaty of defensive alliance, and encouraged each other in the resolution to maintain their religion and liberties against the threatened encroachments of the imperial edict. To Henry VIII. of England, who was at that time just beginning his own erratic career of reformation, they sent a special invitation to co-operate with them, on the basis of the doctrines of the *Confession of Augsburg*, an invitation to which he responded, but which issued in no practical result. The emperor, notwithstanding the strongly hostile attitude which he had assumed, was not prepared as yet to plunge into hostilities. The Turks were menacing the frontier of the empire; he had his own personal objects to gain in the advancement of his brother Ferdinand to the dignity of king of the Romans, an object which he could not accomplish without a majority of votes at an imperial diet. He was content, therefore, to enter anew into negotiations with the Protestant princes; and after many unavailing projects of reconciliation, a treaty of peace was concluded between them at Nürnberg in 1532. The Protestants agreed to support him against the Turks, and to acknowledge Ferdinand as king of the Romans; while the emperor in his turn agreed to abrogate the edicts of Worms and Augsburg, and allow the Protestants the free exercise of their religion until some settlement by a General Council or a diet of the empire.

It was the emperor's necessities, and not his will, which consented to the peace of Nürnberg; there was no prospect, therefore, of its being lasting. But the Protestants availed themselves of their temporary repose to strengthen themselves and extend their power. The emperor continued to urge the pope to convoke a General Council. At length, in 1536, Paul III. issued a summons for a council to meet at

Mantua in the following year; but the Duke of Mantua being disinclined to receive so many turbulent guests into his quiet city, the project did not take effect. In anticipation, however, and convinced that no council convened under the exclusive influence of the pope would deal fairly with the subject in dispute, the Protestants met at Smalkald in the year 1537, and while solemnly protesting against a mere Italian or papal council, at the same time agreed to a new summary of their doctrines, drawn up by Luther, to be presented to the assembled bishops. This summary is known under the name of the *Smalkald Articles*, and along with the *Confession of Augsburg* and the *Apology for the Confession*, constitutes to this day the doctrinal basis of the German Lutheran Church.

At length, in 1546, the same year in which Luther, worn out by his many toils, died somewhat suddenly at Eisleben, a council assembled at Trent. It was soon evident that no compromise was practicable between the Protestant and the papal party, and both sides prepared to try the venture of war. When the Council of Trent promulgated its decrees, and the Reformed princes in the Diet of Ratisbon protested against their authority, the emperor raised an army to compel their obedience. They, on their part, were ready with their forces, and marched into Bavaria against the emperor. The results, in the first instance, were severely disastrous to the Protestant cause, chiefly through the division of the princes, and especially the perfidy of Maurice, the nephew of the Elector of Saxony. Various attempts at reconciliation and compromise were again attempted, in which Melanchthon took a prominent part; but, as before, they came to nothing. A change of fortune gave a temporary triumph to the Protestant arms, and the result was that Charles concluded a formal treaty at Passau, in 1552, which may be considered the foundation of the Protestant liberties of Germany. The Protestants stipulated for the free exercise of their religion, until the meeting of a diet which should settle a permanent religious peace; and in return, they agreed to lend assistance against the Turks, who were still menacing the frontiers of the empire. The promised diet assembled at Augsburg in 1555, and framed articles for the religious pacification of Germany, according to which all adherents of the Augsburg Confession of Faith were left in the undisturbed enjoyment of the rights which they had acquired, were freed from papal domination, and allowed to order their religious concerns as seemed best to them; Protestants and Catholics alike being bound to respect each others' convictions, and not to injure or persecute one another on account of religion, under penalty of being proceeded against as enemies of the empire. This treaty of Augsburg terminates the period of the Reformation in Germany.

In the neighbouring countries of Denmark and Sweden, the progress of reformed opinions had proceeded still more rapidly than in Germany. In both these countries, the sovereigns took the lead in enlightening their people, and freeing them from the tyranny of the church of Rome. In Sweden particularly, Gustavus Vasa shewed both great courage and prudence in carrying out a reforming policy. He invited learned Lutheran teachers into his dominions, and shewed special zeal in the circulation of a Swedish version of the Scriptures, made by one of these teachers, named Olaus Petri, who occupies the most prominent place among the Swedish reformers. At an assembly of the states at Westeraas, in 1527, while the reformers in Germany were still struggling for bare existence, it was unanimously resolved that the Lutheran doctrines should be adopted in Sweden, and a Reformed Church, entirely independent of Rome, established. The same result occurred in Denmark in 1539, when an assembly of the Danish states at Odensee gave formal sanction to a plan of religious doctrine, worship, and discipline, drawn up by Bugenhagen, a disciple and friend of Luther, whom Christian III. had invited from Wittenberg for the purpose.

In France, the progress of the Reformation was of a much more uncertain and wavering character. As early as 1523, the new doctrines had spread greatly in many parts of France, under the countenance of Margaret, queen of Navarre, sister of Francis I., the constant rival of Charles V. The names chiefly associated with this early phase of the French Reformation, besides that of Margaret herself, are those of Lefevre and Farel, the latter particularly a man of active and fiery zeal, who had been originally a priest in Dauphiné, and whom we find subsequently associated with Calvin in Geneva. The university of Paris became for a time strongly infected with the 'new learning,' and many of the nobility, as well as the people, were actually inclined to throw aside the superstitions of Rome, and embrace a more scriptural form of faith. But the violent and inconsistent policy of Francis I., and the fierce spirit of faction which the struggle engendered, gave an unhappy turn to the course of events in France, and prevented the Reformation from obtaining in that country anything of the same national recognition that it obtained in Germany and elsewhere. Both Farel and Calvin were driven by the violence of persecution into Switzerland. The latter settled for a time at Basel, where he completed and published the first edition of his *Institutes*. The famous preface, addressed to Francis I., bears the date of Basel, August 1, 1535. In the following year, he repaired to Geneva, where Farel, already labouring in the work of the Reformation, retained him by a 'divine menace,' and he began that great career as a reformer, theologian, and legislator which has rendered his name so illustrious.

In Spain and in Italy, the spread of the Reformation, which in both countries had taken an active and hopeful start, was almost entirely suppressed by the power of the Inquisition. The church of Rome was able to bring its whole force to bear upon these countries, unchecked by political hostility. The flames of martyrdom, which elsewhere seemed to kindle a double zeal for the cause which they aimed to destroy, were here kept burning with such an incessant and devouring cruelty, as to consume all life out of the new movement, and brand the name of Protestant with the infamy which, in the popular mind, always attaches itself to hopeless failure.

The same policy was attempted in the Netherlands. Upwards of 100,000 of the inhabitants are said to have fallen under the atrocious cruelty of Charles V., and his son, Philip II. But the spirit of political freedom and moral earnestness proved at length an equal and finally, through a protracted and bloody conflict, a victorious match for the blood-thirstiness even of Philip and Alva; and the principles of the Reformation, after a Calvinistic type, were at length established in the United Provinces, along with the political supremacy of the House of Orange.

The Reformation in England is marked by peculiar features — an under-current of popular movement, dating even from the time of Wycliffe, and a somewhat inconsistent and wavering series of political changes during the reigns of the three Tudor princes, Henry VIII., Edward VI., and Elizabeth. In the beginning of the 16th c., as

early as the first movements of Luther, there are indications of a revival of evangelical religious life among the tradesmen of London, and the peasantry in different parts of the country, particularly in Lincolnshire. The popular mind had begun to look with suspicion and ridicule upon some of the most characteristic doctrines of Romanism. A story is told by Foxe of a Lincolnshire peasant, busy thrashing his corn in his barn, accosted by a neighbour. 'Good-morrow; you are hard at work.' 'Yes,' replied the man, in allusion to the doctrine of transubstantiation, 'I am thrashing God Almighty out of the straw.' The residence of Erasmus in England, in the beginning of the reign of Henry VIII., stimulated a spirit of biblical inquiry among the educated classes, which, while it remained for the most part faithful to the church of Rome, as in the case of More and others, yet helped to advance a reforming movement. The study of his Greek Testament was eagerly entered upon by a few students at both universities, especially at Cambridge. We find Biling, Tyndale, and Frith associated at the latter place in 1520; and in the decade following, Cranmer, Ridley, and Latimer all come into prominent notice. It is at the end of this latter period—the year 1529—a year before the meeting of the Diet of Augsburg in Germany, that the Reformation in England may be said to take its first decided advance. In this year, the usurpations of the clergy, and the manifold ecclesiastical abuses prevailing in the country, were the subject of parliamentary legislation. The negotiations as to Henry's divorce from Catharine had been proceeding for some time, and the country was greatly excited by the course of events. In 1533, Henry was married to Anne Boleyn, and his former marriage with Catharine declared void. All appeals to Rome were forbidden. In the two following years, the sovereign was declared to be the supreme head of the church of England, with authority to redress all errors, heresies, and abuses in the church; the monasteries were dissolved; and parliament petitioned that a new translation of the Scriptures might be authorised, and set up in churches. In all this course of reformation, however, there was but little religious impulse on Henry's part, for we find him again, in 1539, yielding violently to the spirit of reaction, and passing the famous statute known as the Six Articles, which rendered it penal to deny the doctrine of transubstantiation, or to affirm that priests might marry. Cranmer, who had been for some years Archbishop of Canterbury, laboured to prevent their passing; and Latimer resigned his bishopric as soon as they were confirmed.

With the accession of Edward VI., in 1547, the Reformation greatly advanced. The statute of the Six Articles was repealed, with other reactionary measures of the close of Henry's reign. The parliament of 1548 established the use of the Book of Common Prayer; the clergy were permitted to marry; the cup was allowed to the laity; and in 1551, the forty-two articles of religious belief, afterwards reduced to thirty-nine, were promulgated. The temporary restoration of popery under Mary, and the final establishment of Anglican Protestantism under Elizabeth, are well-known events, belonging to the special history of these reigns.

In Scotland, the reforming impulses began with Patrick Hamilton about the same time that Cranmer and Latimer first appear active in England. Hamilton was educated in Paris and in Germany, and learned there the doctrines which he introduced into his native country. There was something, indeed, of the same popular movement, known under the name of Lollardism in Scotland, as in England, and Hamilton's preaching may have served to kindle up the dying embers of this movement. His early death, in 1528, undoubtedly produced a great effect. 'Men began,' says Knox, 'very liberally to speak.' 'The reik of Mr Patrick Hamilton infected as many as it did blow upon.' After Hamilton, George Wishart appears as the next hero-martyr of the Scottish Reformation; and in connection with him—as his reverend disciple and companion—we first hear of John Knox, who became finally the great leading spirit of the movement, by whose influence popery was extirpated, and the Reformation established in Scotland in 1560. The Scottish Reformation followed the type of the Calvinistic Reformation in Geneva, where Knox had taken refuge during the period of persecution in Scotland, and acted for some years as the companion of Calvin. Episcopacy was abolished, and the fabric of the Reformed Kirk set up in every respect as far as possible in opposition to the papal system, which had become the opprobrium of the people.—Ranke's *History of the Reformation in Germany;* D'Aubigné's *History of the Reformation;* Waddington's *History of the Reformation.*

Such is the light in which this great religious revolution presents itself to the Protestant. Catholic students naturally regard it very differently; and although the name REFORMATION has come to be generally adopted as the historical designation of the religious movement of the 16th c., this name is only accepted by Catholics under protest, and as a conventional phrase, the rigorous meaning of which they distinctly repudiate. The more strict writers among Catholics employ in its stead the name 'Pseudo-Reformation,' or 'So-called Reformation.'

As regards the event itself, Roman Catholics, while they admit that many abuses existed in the church which called for reform, and many superstitions existed which deformed the true character of religion among the ignorant masses of the people, contend nevertheless not only that the extent and the nature of these abuses and superstitions are greatly exaggerated, but also that the task of reforming them did not imply either the necessity or the lawfulness of a separation from the church. They assert that the conduct and character of many of those who were most prominently engaged in the movement prove them to have been influenced by corrupt and unworthy motives; that in their effort to throw off the obedience of Rome, they rather sought emancipation from moral and disciplinary restraint, than the purification of the religious system of the church; that the change in many of the countries in which it was effected was brought about mainly through the agency of the sovereign, with a view to the appropriation of the revenues of the church; and that in others it was brought about by appealing to the prejudices of excited and unreasoning multitudes, who were taught to confound the system with its abuses, and who were incapable of distinguishing the true doctrine of the church from the superstitions which were justly held up for reprobation. And thus in the view of Catholics, the true REFORMATION of the church was not that which has been described above, as carried out by the seceders of the 16th c., but that internal change which was effected by the decrees of the Council of Trent, and by the religious revival which took place simultaneously with the sittings of that assembly. They dwell much on the fact, that all the notable successes of Protestantism were at its first origin, and that, in the words of Lord Macaulay, if Protestantism had at its first onset 'driven Catholicism to the Alps and Pyrenees,' so Catholicism, in its turn, 'rallied

and drove back Protestantism even to the German Ocean.'

As to the moral and religious results of the Reformation, the same difference of opinion exists. That the very necessity of action which it created had a beneficial influence on their own church, by the internal revival to which it led, Catholics freely admit; but they look upon the revolt against authority, the inauguration of religious innovation and skepticism, the separation from the church, and the disruption of Christian unity, as fraught with moral and intellectual evil; and a work of much learning has been devoted, by the well-known German Catholic theologian, Dr Döllinger, to establishing this point by the confessions of the first reformers themselves, and their immediate successors. See *Die Reformation, ihre innere Entwicklung und ihre Wirkungen*, von J. Döllinger (3 vols. 8vo., Regensburg, 1848).

REFO'RMATORY SCHOOLS.—The Ragged Schools (q. v.) established towards the close of the last century were indirectly juvenile reformatories. The mental, industrial, and religious training which they imparted to the young generation of their time was the beginning of the greatest of all social problems. Early in the present century the example of the humble men who were the fathers of the ragged schools was rapidly followed by the establishment of asylums and reform schools sustained by public and private munificence at Falck, Weimar, Zeller, Beuggen and Overdyk, which prepared the way for the great work by Weichern at the Rauhes Haus (q. v.), at Hamburg, and of de Metz at Mettray (q. v.) in France. The Society of Friends also promptly initiated measures for the relief and reformation of the suffering and depraved. The London Philanthropic Society established in 1788 the Redhill Reformatory, one of the most successful in England. A second school was established in Warwickshire in 1818, and a third in 1830; both these efforts failed for want of support.

The manual labour schools and home colonies of William Allen were founded in 1825 at Smithfield, near London, and were successful.

The first reformatory for girls was the Victoria Asylum, established in 1834 at Chiswick. In 1852 schools were opened by sundry philanthropists, among whom were Mr Baker, Miss Carpenter, Joseph Sturge, and Mr Adderley; government legalised the system, and the schools are now visited by Her Majesty's Inspector, who has traced to their operation the late marked decline in juvenile delinquency, previously rapidly on the increase.

The first reformatories in America, established about 1800, under municipal and private patronage, were the Boston Female Asylum and Boston Asylum for Indigent Boys (now Farm School). The New York House of Refuge was opened in 1825, and contained in 1870 nearly 1000 inmates, more than 12,000 having been trained under its roof. In 1828 a House of Refuge was opened in Philadelphia, 'to save, not to punish' juvenile delinquents, and in 1848 the corner-stone for another for coloured juveniles was laid. In 1854 the white department was reconstructed on a more extended scale: 10,500 have been instructed in these institutions. A Western House of Refuge has been erected at Pittsburg.

To awaken interest and invite enlightened inquiry into the best methods of repressing and correcting juvenile delinquency and kindred purposes, Boards of State Charities have been instituted by Massachusetts, Rhode Island, New York, Pennsylvania, Ohio, Illinois, and North Carolina. By the excellent report of Col. Gardiner Tufts, of Massachusetts, for 1869, it appears that reformatory legislation is there yielding its appropriate fruits in healing and eradicating organic degeneracies, and repressing and correcting criminal depravities. A State Primary School was established in 1866, co-operating with numerous municipal and private reformatories, industrial schools, children's aid societies, and similar organisations, sanctioned and supported by the humane and benevolent. The records of three reformatories and three almshouses show the names of more than 3400 children now nominally the wards of the commonwealth; of these 1900 have been indentured as apprentices, under the care of a special visiting agent, who exercises over them a paternal supervision and protective care. On Sept. 30, 1869, there were 1168 inmates of the Reformatories, State Primary School and almshouses.

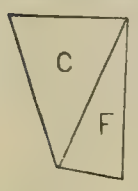
Among the organisations intended to restrain the indigent and neglected wandering children from wrong courses and raise them to positions of usefulness and honour should be named the *Truant Schools*, which date from 1862, and have been established at Worcester, Springfield, New Bedford, Cambridge, and Newburyport; the Boston and Lowell reform schools act also partially in this capacity.

In 1866 the state of New Jersey established a Reform School at Jamesburg on the open farm or family plan, and in 1869 appropriated $12,500 towards its support, and $10,000 towards the extension of the building. Here are (1871) gathered 150 of the dangerous class of street-boys, who, with few exceptions, have been reclaimed, and are preparing for lives of usefulness and virtue.

In 1868—69 there were 64 reformatory and industrial schools in England and Scotland. In 1869 there were 6248 juveniles (5072 boys and 1176 girls) under detention. About 70 per cent. of the discharged do well; 20 per cent. relapse, and the remainder become idlers, but not criminal. When well managed, 88 per cent. do well. £121,697 were expended in the cause in 1869.

REFO'RMED CHURCHES, a term employed in what may be called a conventional sense, not to designate all the churches of the Reformation, but those in which the Calvinistic doctrines and still more the Calvinistic polity prevail, in contradistinction to the Lutheran (q. v.). The influence of Calvin proved more powerful than that of Zwingli, which, however, no doubt considerably modified the views prevalent in many of these churches. The R. C. are very generally known on the continent of Europe as the *Calvinistic Churches*, whilst the name *Protestant Church* is in some countries almost equivalent to that of *Lutheran*. One chief distinction of all the R. C. is their doctrine of the sacrament of the Lord's Supper, characterised by the utter rejection not only of transubstantiation, but of consubstantiation; and it was on this point, mainly, that the controversy between the Lutherans and the Reformed was long carried on. See LORD'S SUPPER and SACRAMENTARIAN CONTROVERSY. They are also unanimous in their rejection of the use of images, and of many ceremonies which the Lutherans have thought it proper to retain. Among the R. C. are those both of England and Scotland, notwithstanding the Episcopalian government of the former, and the Presbyterianism of the latter; the Protestant Church of France, that of Holland and the Netherlands, many German churches, the once flourishing Protestant Church of Poland, &c., with those in America and elsewhere which have sprung from them.

REFRA'CTION. See DIOPTRICS; HEAT; REFRACTION, DOUBLE; UNDULATORY THEORY. In the articles referred to, the ordinary experimental laws of single and double refraction are stated; geometrical consequences, such as the mode of action of lenses, prisms, telescopes and microscopes, are deduced from them; and the connection of these laws with the hypothesis of undulations is explained.



It remains that we should give the refractive and dispersive powers of a few common substances, to shew the great diversity which exists amongst them, especially in the non-proportionality of

dispersion to refraction. The following results are due to Fraunhofer, who was the first to employ, for this purpose, Wollaston's discovery of the *fixed lines* in the Spectrum (q. v.), without whose aid all such observations are of comparatively little value. The lines B, D, and H, which we have selected for the table, correspond to definite rays of red, orange, and violet respectively.

Substance.	Refractive Index.			Dispersion.
	B.	D.	H.	(H—B).
Flint Glass, . .	1·6277	1·6350	1·6710	0·0433
Crown Glass, .	1·5258	1·5296	1·5466	0·0207
Water. . .	1·3310	1·3336	1 3442	0·0132
Turpentine, .	1·4705	1·4744	1 4939	0·0234

The numbers in the last column roughly shew how far the red and violet are separated by prisms (of a given angle) of the various substances; and even this brief list shews how erroneous was Newton's idea that dispersion is proportional to refraction, an idea which led him to the conclusion that an Achromatic (q. v.) combination was impossible.

Thus we see that the refractive indices of flint and crown-glass are (approximately) as 16 : 15, while the dispersive power of flint is more than double that of crown. Hence, if we construct prisms of the two materials, such that the angular separation of red and violet which they produce shall be equal, the angle of the flint will be far less than that of the crown, and the whole refraction also less. The combination of two such prisms, with their edges turned opposite ways, as in the cut, will thus bend (or refract) a ray of white light without separating the red from the violet—and thus we may obtain *refraction without colour*.

This is not strictly the case, on account of what is called *Irrationality of Dispersion*, the existence of which is easily seen from the above table. Thus, if we form two spectra, by means of properly constructed prisms of different media, such that the lines B and H coincide, the lines D will not generally coincide. In other words, some substances draw out the red end of the spectrum more than the violet—and *vice versâ*. Thus, from the above table,

	D—B.	H—D.
Flint Glass, . .	0·0073	0·0360
Crown Glass, . . .	0·0038	0·0170

But 73 : 360 :: 38 : 187; hence we see that the distance from B to D in flint bears a less proportion to that from D to H than it does in crown. Thus, if, by proper arrangements, as before mentioned, B and H be made to coincide, D will be nearer the middle of the crown spectrum than of the flint. Hence a double achromatic lens, composed of flint and crown, may be made to refract equally any *two* colours of the spectrum; but there will be a slight non-accordance of the remaining colours. *Three* colours may be made coincident by using a *triple* lens, but this is now rarely constructed.

REFRACTION, Conical. In certain cases, light, passing as a single ray through a plate of a crystallised body, emerges as a hollow *cone* of rays; and in others, a single ray, falling on the plate, becomes a cone inside the crystal, and emerges as a hollow cylinder. These extraordinary appearances were *predicted* from theory by Sir W. R. Hamilton (q. v.), and experimentally realised by Lloyd. They form one of the strongest arguments in favour of the truth of the undulatory theory of light. In our article on that subject, we shall briefly describe them in connection with the theory of double refraction in biaxal crystals.

REFRACTION, Double. The great majority of crystallised bodies: and in general, all transparent bodies (such as glass), when unequally strained, as by pressure, heat, or rapid cooling, divide a single ray which falls on their surface into two. Through a plate of such a substance every object appears doubled. The cause of this singular phenomenon cannot be explained without reference to Polarisation (q. v.), and it is therefore deferred to the article on the Undulatory Theory of Light, where the principal experimental facts will be given along with their theoretical explanation.

REFRAI'N (Fr.), otherwise called the *burden* of a song, a part of a song which is repeated at the close of every stanza.

REFRI'GERANTS. This term is applied in Medicine both to internal and external cooling remedies. The medicines of this class prescribed for internal use cause a refreshing feeling and a sensation of coolness throughout the system, although they do not in reality diminish the temperature of the body. Their principal use is in the treatment of febrile and inflammatory affections, in which the benefit they produce appears to depend on the fact, that their direct action on the coats of the stomach occasions, by nervous sympathy, a temporary reduction in the force of the circulation. They likewise have the power of allaying gastric irritability and the morbid sensations of heat and thirst. The following are the refrigerants in most common use for internal administration: citric and tartaric acids taken in combination with bicarbonate of potash as effervescing draughts, ripe oranges, lemons (in the form of Lemonade, q. v.), chlorate of potash (ten grains dissolved in water, and sweetened with syrup, to be taken every second hour), and nitrate of potash, which may be taken in the same manner as the chlorate, or as *nitre-whey*, which is prepared by boiling two drachms of nitre in a pint of new milk; the strained milk may be given in frequent doses of two or three ounces. Many continental physicians regard oxalic acid in the form of lemonade as the best of all the refrigerants. Its poisonous character must not be forgotten, but five grains dissolved in half a pint (or more) of water may be taken, in divided doses, in the twenty-four hours with perfect safety.

The following remarks on the external application of refrigerants are for the most part condensed from Mr Simon's able article on 'Inflammation' in Holmes's *System of Surgery*. Cold, continuously applied, is the sedative of every vital manifestation; and in theory, it may be regarded as being in direct and essential opposition to the causes of inflammation; and as it is thus an antidote to the causes of inflammation, rather than a remedy for the resulting changes, so, in order to get full advantage from its use, it should be employed from the moment when these causes begin to operate. Cold is of great value in the treatment of wounds, especially such as are made in surgical operations. The local temperature can be thus continuously moderated, care being taken that it is not too much reduced, so as to occasion gangrene. Under the effective use of cold (together, of course, with absolute rest of the parts), many a knee-joint, whether wounded accidentally or by a surgical operation, recovers without permanent injury. In most cases, local cooling is best effected by water of the desired temperature. Cloths wetted with it are spread over the surface which is to be acted on, their original low temperature being retained either by their being continuously dripped upon by means of a bundle of threads inserted in a reservoir of cold water, and acting like a siphon, or by their being frequently re-wetted or changed. Their surface should be exposed as freely as possible to the air, so as to secure ample space for evaporation. In

cases where great cold is required—as, for example, in cases of strangulated hernia, of inflammation of the brain and its membranes, or of fever with well marked cerebral symptoms—bladders of pounded ice are preferable to wetted cloths. Both as regards the degree of cold and the period of its application, the surgeon should to a considerable degree be influenced by the sensations of his patient. When its application gives comfort, it is almost certain to be doing good; and in most cases where it gives discomfort, it is doing harm.

A notice of the external use of refrigerants would be imperfect without a reference to the memoir of Dr Esmarch, Professor of Surgery in the University of Kiel, *On the Use of Cold in Surgery*, recently (1861) translated by Dr Montgomery for 'The New Sydenham Society.' His mode of application is by means of India-rubber bags filled with ice, snow, or some freezing mixture; or of thin iron-plate reservoirs of cold water, made by means of a mould of gutta-percha to fit any inflamed part. In a case of 'chronic purulent inflammation of the knee-joint,' the ice-bags were continuously applied for 12 weeks. Dr James Arnott's investigations on 'Local Anæsthesia by Cold,' in the *Medical Times* for the years 1854–5–7, and Dr Chapman's method of treating nervous diseases by the application of cold to the spine, as recorded in his *Functional Diseases of Women* and elsewhere, require also a passing reference.

According to Dr B. W. Richardson, the phenomena observed on freezing animal tissue depend essentially on the change in the condition of the water of the body. If the 85 per cent. of water composing nerve tissue be rendered solid, we can produce a temporary death. Dr Richardson's 'spray instrument' has been employed to produce local anæsthesia (q. v.), on the supposition that this result is 'due to a freezing process arising from rapid evaporation, and not to any specific effect of the agent employed; an opinion not yet fully sustained.' See *Report of British Association*, 1868. In addition to what is stated under the articles BATH and HYDROPATHY, it is important to know that prolonged immersion in water as warm as 95° Fahr. may be the means of reducing febrile temperature.

REFRIGERA'TION OF THE EARTH. That the earth is at present losing heat, is an immediate consequence of the observed fact, that the temperature of its crust *increases* as we descend; for, in any conducting body, the flux of heat is always from warmer to colder parts; and the rate at which heat is thus lost can be easily calculated if we know the conducting power (for heat) of the rocks forming the crust, and the rate at which the temperature increases with the depth under the surface; for the conductivity may be measured by the quantity of heat which, in unit of time, passes (per square foot of surface) through a layer of rock of one foot thickness, whose upper and lower surfaces are maintained at temperatures differing by 1° F. Hence, if k be the conductivity of the crust, and if the temperature increases by 1° F. every x feet of descent, the quantity of heat lost, in unit of time, from each square foot of surface, is measured by $\frac{k}{x}$. k and x can be determined by experiment for any particular locality, and thus the loss may be determined. These quantities vary very much in value in different localities, thus x is sometimes as great as 110, sometimes as small as 15. The value 50 is generally supposed to give a fair average—that is, for every 50 feet of descent the temperature increases by 1° F. Hence the stifling heat experienced in deep mines. At the depth of a mile, the temperature would on this estimate exceed that of the surface by more than 100° F. Beds of coal at such a depth could not be wrought, as the temperature would far exceed that of tropical climates.

Three methods of accounting for this increase of temperature towards the interior of the earth have been proposed: 1. That the earth was originally molten, either throughout, or for a considerable depth over the whole surface; 2. That the internal heat is due to chemical combination; 3. That the earth, ages ago, passed through a region of space where the temperature was far above that of its present envelope.

Of (1) it is sufficient to say, that such a state is the necessary consequence of impact, if the earth was formed by the aggregation of cosmical masses due to their mutual gravitation. It is scarcely doubted now that this is the origin of solar and stellar heat; and the fact of the moon's turning always the same face to the earth (see ROTATION), is most easily explained on the hypothesis of her original fluidity. The figure of the earth (see EARTH) is also a strong argument in favour of this hypothesis. This explanation of the origin of the earth's internal heat is obviously consistent with the increase of temperature as we descend below the surface—for a spherical mass of molten rock will evidently soon cool externally, while its low conductivity (rendered still lower by the high temperature) will prevent the interior from supplying anything at all equivalent to the loss at the surface. On this hypothesis, the rate of loss of heat must constantly become smaller and smaller, but very slowly; and it is possible that a considerable portion of the earth's mass may still be in a melted state.

The second hypothesis is perfectly sufficient to account for observed facts, but is apparently unnecessary, since (1) has been shewn to be, in the universe, a *vera causa*. It is only alluded to here because Lyell and other distinguished geologists have endeavoured to shew from it that the earth need not be losing heat on the whole, a result perfectly untenable. They suppose the internal heat to be generated by chemical combination, and then that the compounds so formed are again decomposed by electric currents produced by the heat (see THERMO-ELECTRICITY), and are thus prepared to combine again, and reproduce the heat. Were this the case, we should have a Perpetual Motion (q. v.), and, in the present state of science, this is known to be impossible.

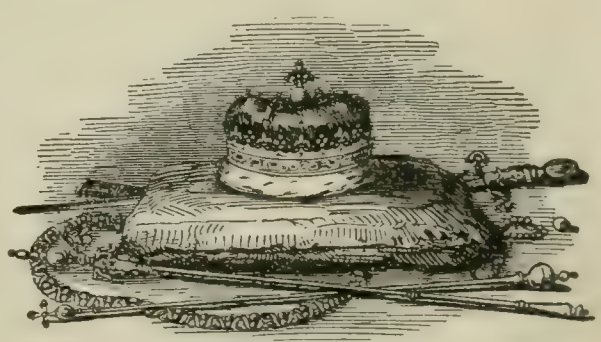
The third hypothesis, proposed by Poisson, is easily shewn to be inconsistent with known facts; for, if the passage through the warm region be supposed to have taken place from 1250 to 5000 years ago, the temperature at the earth's surface must have been from 25° to 50° F. above the present mean temperature, which is inconsistent with history. If it took place 20,000 years ago, the mean temperature must have been 100° F. above its present value. Geology shews that this cannot be accepted. And, if it be supposed to have taken place more than 20,000 years ago, the requisite temperature must have been incompatible with the existence of animal or vegetable life.

From the above argument, which is taken from a paper by Professor W. Thomson in the *Transactions of the Royal Society of Edinburgh* (1862), it is obvious that the first hypothesis is that which we must, in the present state of our knowledge, adopt.

Supposing the temperature of melting rock to be from 7000° F. to 10,000° F. (and experiments seem to shew that it lies somewhere between these limits), the present state of temperature of the crust indicates that the earth became solid somewhere

between 100,000,000 and 200,000,000 years ago. These estimates are based on the known laws of conduction of heat discovered by Fourier, and the conductivity of rocks and soils, deduced by Principal Forbes (q.v.) from observations made in the neighbourhood of Edinburgh. But as these observations refer to conductivity at very moderate temperatures only, and as Forbes has shewn that conductivity is in general lowered by heating, the lower limit above may possibly be reduced to *twenty million years*.

In conclusion, we may mention, to shew how little the internal heat of the earth has to do with surface temperature, that Thomson has shewn (*Proc. R. S. E.*, 1863—1864) that if we accept the estimate of 1° F. of increase of temperature for 50 feet of descent, the earth's surface is heated (by conduction of heat from within) only $\frac{1}{75}$th of a degree Fahrenheit.



REFRI'GERATOR. See FREEZING MIXTURES.

REFUGEE' (Fr. *refugié*), a name given to persons who have fled from religious or political persecution in their own country, and taken refuge in another. The term was first applied to those Protestants who found an asylum in Britain and elsewhere at two different periods, first during the Flemish persecutions under the Duke of Alva in 1567, and afterwards in 1685, when Louis XIV. of France revoked the Edict of Nantes. Of the numerous French artisans who settled in England on this last occasion, the most part Anglicised their names, as by substituting Young for 'Le Jeune,' Taylor for 'Tellier,' &c., so that their posterity can now hardly be recognised as of foreign origin. According to Lower (*Patronymica Britannica*) De Preux became Deprose, and 'Richard Despair, a poor man,' buried at East Grimstead, was, in the orthography of his forefathers, Despard. There were also refugee families of a higher class, some of whose descendants and representatives came to occupy a place in the peerage. The Bouveries, Earls of Radnor, are descended from a French refugee family. The refugee family of Blaquière was raised to the Irish peerage; and Charles Shaw Lefevre, Lord Eversley, is the representative of a family of Irish refugees. The military employment offered in Ireland after 1688 maintained a considerable number of foreign Protestants. General Frederic Armand de Schomberg, was raised by William III. to the peerage, becoming eventually Duke of Schomberg. A Huguenot officer of hardly less celebrity was Henry Massue Marquis de Ruvigny, created by William III. Earl of Galway. Lord Ligonier was also of a noble Huguenot family, and England has had at least one refugee bishop in Dr Majendie, Bishop of Chester, and afterwards of Bangor. Among other refugees of note may be enumerated Sir John Houblon, Lord Mayor of London in 1695, one branch of whose family was represented by the late Lord Palmerston; Elias Bouherau or Boireau, D. D., whose descendant was created a baronet as Sir Richard Borough of Baselden Park, Berkshire; as well as Martineaus, Bosanquets, and Papillons, whose descendants have attained more or less eminence in the country of their adoption. The first French Revolution brought numerous political refugees to England, and Great Britain is noted throughout Europe for affording a ready asylum to refugees of all classes, both political and religious. Weiss' *History of the French Protestant Refugees, from the Revocation of the Edict of Nantes to the Present Time*, translated by Hardman (London, 1854); J. S. Burn's *History of the French, Walloon, Dutch and other Foreign Protestant Refugees settled in England* (London, 1846), and S. Smiles' *The Huguenots, their Settlements, Industries, &c., in England, Ireland, and America*, N. Y., 1868

REGALBU'TO, or RAGALBUTO, a city in the island of Sicily, in the province of Catania, and 30 miles west-north-west of the city of that name. It is beautifully situated on a hill near the right bank of the river Salso, and with Mount Etna bounding the prospect on the north-east. Its only object of interest is the cathedral. Pop. 8995.

REGA'LIA, the ensigns of royalty, including more particularly the apparatus of a coronation. The regalia of England were, prior to the Reformation, in the keeping of the monks of Westminster Abbey, and they are still presented to the sovereign at the coronation by the dean and prebendaries of that church. During the Civil War, the crown and most of the regalia fell victims to Puritan zeal; and on the restoration of the royal family, new ensigns had to be made for the coronation of Charles II., which, with occasional alterations and repairs, have continued in use down to the present day. The regalia, strictly so called, consist of the crown, the sceptre with the cross, the verge or rod with the dove, the so-called staff of Edward the Confessor (made in reality for Charles II.), the blunt sword of mercy called Curtana, the two sharp swords of justice, spiritual and temporal, the ampolla or receptacle for the coronation oil, the anointing spoon (probably the only existing relic of the old regalia), the armillæ or bracelets, the spurs of chivalry, and various royal vestments. All these, with the exception of the vestments, are now exhibited in the Jewel-room in the Tower of London, in which are also a smaller crown, sceptre, and orb for the coronation of a queen-consort, two other queen-consorts' sceptres—one of ivory, made for Marie d'Este; and the state-crown of silver and diamonds, which was used at the coronation of Queen Victoria, containing a large ruby and sapphire, the former said to have been worn by Edward the Black Prince. The Prince of Wales's crown of gold, without stones, is modern.

The proper regalia of Scotland consist of the crown, the sceptre, and the sword of state. The crown probably belongs to the time of Robert Bruce, and is adorned with crosses and fleurs de lis alternately. It was originally an open crown, but two concentric arches were added in the reign of James V., surmounted at the point of intersection by a mound of gold and a large cross patée. The sceptre is of the time of James V.; the sword was a present from Pope Julius II. to James IV. in 1507. During the Civil War, the regalia were removed by the Earl Marischal for safe custody from the Crown-room of Edinburgh Castle, their

Regalia of Scotland.

usual place of deposit, to his castle of Dunnottar; and while Dunnottar was besieged by the Parliamentary army, the regalia were preserved by being conveyed by stratagem to the manse of Kinneff, by the wife of Ogilvy of Barras, the lieutenant-governor, and the wife of the minister of Kinneff.

From the Restoration to the Union, the regalia continued to be kept in the Crown-room as formerly; at the beginning of each session, they were delivered to the Earl Marischal or his deputy, in whose custody they remained while parliament was sitting, and were afterwards restored to the charge of the Treasurer. William, ninth Earl Marischal, who opposed the Treaty of Union in all its stages, declined to witness its consummation, but appeared by his deputy, who took a written protest that the regalia should not be removed from the castle of Edinburgh without warning given to him or his successor in office. From that time till 1818, the regalia remained locked in a chest in the Crown-room, away from public gaze, and it came to be the general belief that they had been secretly conveyed away to London, an idea confirmed by the keeper of the Jewel-office in the Tower shewing a crown which was alleged to be that of Scotland. On the 4th February 1818, an order being obtained by warrant under the sign-manual of George IV., then Prince-regent, the chest in the Crown-room was broken open, and the crown, sword, and sceptre were found as they had been deposited at the Union, along with a silver rod of office, supposed to be that of the Lord High Treasurer. They are now in the charge of the officers of state for Scotland, as commissioners for the custody of the regalia, and are exhibited in the Crown-room, along with a ruby ring, set with diamonds, worn by Charles I. at his coronation at Holyrood in 1633; the golden collar of the Garter, sent by Elizabeth to James VI.; the St George and Dragon, or badge of the Order of the Garter; and the badge of the Order of the Thistle, with figures of St Andrew and Anne of Denmark, set in diamonds. These latter insignia were bequeathed by Cardinal York, the last of the Stuarts, to George IV., and sent to Edinburgh Castle in 1830, by order of William IV.

REGALIA, or REGALE, RIGHT OF, a right in ecclesiastical things, claimed by sovereigns in virtue of the royal prerogative, which has frequently been the subject of controversy between kings and popes. It involved several points as to presentation to benefices, most of which formed the object from time to time of negotiation by concordat; but the most serious conflict arose out of the claim made by the crown to the revenues of vacant benefices, especially bishoprics, and the co-ordinate claim to keep the benefice or the see vacant for an indefinite period, in order to appropriate its revenue. This plainly abusive claim was one of the main grounds of complaint on the part of the popes as to the practice of lay INVESTITURES (q. v.), and it reached its height in England under the first Norman kings, especially William Rufus. The most memorable conflict, however, on the subject of the regalia was that of Innocent XI. (q. v.) with Louis XIV., which was maintained with great pertinacity on both sides for several years, the king extending the claim to some of the French provinces which had until then been exempt from it, and the pope refusing to confirm any of the appointments of Louis to the sees which became vacant, as long as the obnoxious claim should be persisted in. The dispute continued till after the death of Innocent, Louis XIV. having gone so far as to seize upon the papal territory of Avignon in reprisal; but it was adjusted in the following pontificate, the most obnoxious part of the claim being practically abandoned, although not formally withdrawn.

REGA'LITY, a species of territorial jurisdiction formerly existing in Scotland, nearly akin to a Palatinate (q. v.) in England. The lands were given over by the sovereign *in liberam regalitatem* to some powerful noble, called a *Lord of Regality*, to control as he best might with the strong hand. The lord of regality exercised the highest prerogatives of the crown, including originally the four pleas, often having a complete court of his own, with seneschal, chancellor, chamberlain, and other officials, in imitation of royalty. An offender amenable to a court of regality might have been repledged from the sheriff, or even from the Court of Justiciary. Jurisdictions of regality were abolished by act 20 Geo. II. c. 50.

RE'GALS (perhaps from *rigabello*, an instrument used prior to the organ in the churches of Italy), a small portable finger-organ in use in the 16th and 17th centuries, and perhaps earlier. Many representations exist of this instrument, including one sculptured on Melrose Abbey. The tubes rested on the air-chest, which was filled by the bellows; and the bellows were managed with one hand, and the keys with the other. Until 80 years ago, there existed in the royal household an officer called the *Tuner of Regals*.

REGA'RDANT, a term used in heraldry with reference to an animal whose head is turned backwards. See PASSANT and RAMPANT.

REGA'TTA. This word originated in the Venetian dialect, and signified a boat-race, held annually with great solemnity among the gondoliers. Thence the expression has extended its meaning, and is now applied to all rowing or sailing matches indiscriminately, and especially to the contests between yachts.

REGELA'TION. This is an exceedingly ill-chosen term for a somewhat obscure phenomenon, inasmuch as it implies a previous state which may not have existed. Unfortunately, the term has come into general use, and we must make the best of it. The principal fact to be explained is the adhesion of two pieces of ice brought into contact, not merely in air, but even when both are immersed in water at such temperatures as 100° F. Several explanations have been proposed, of which we may specially mention those of Faraday, Forbes, and J. Thomson.

Faraday's idea seems to be, that in liquid and solid bodies the proximity of particles in a particular state tends to produce the same state in other particles; and thus, that a film of water between two plates of ice tends to assume the solid state. There are many singular phenomena in physical science which are apparently explicable by this suggestion; but with all due deference to so great an authority, the so-called explanation seems merely to *shift* the difficulty, without in any way overcoming it.

Forbes starts with the assumption, that ice is essentially colder than water, and therefore that there is constantly a transfer of heat from water to ice which is in contact with it; the effect being to cover the surface of the ice with a film of half-melted ice or half-frozen water. Such a film, existing between two slabs of ice, would part with heat to both, and would freeze without melting the adjacent ice. This explanation would be satisfactory if the postulate could be granted, but it seems very improbable that there is any such essential difference of temperature between solid and liquid water.

The explanation proposed by Professor J. Thomson is undoubtedly founded on a *vera causa*, but there may be some hesitation in allowing that the cause is adequate to the production of the observed effect in every case. It is certain, however, that it accounts for at least part of the phenomenon. It is founded on his very beautiful theoretical discovery that *the freezing-point of water is lowered by pressure*.

which was experimentally verified by W. Thomson. Hence, if two slabs of ice be pressed together, at the points of greatest pressure the ice will be melted; its latent heat of fusion must be drawn from surrounding bodies, and thus cold is produced which will freeze part of the film of water between the two slabs. The points of greatest pressure will thus be shifted, and the process of melting and regelation may go on indefinitely. Objections to this explanation were advanced by Faraday and Forbes, who shewed that slabs of ice freeze together when suspended vertically with the view of avoiding pressure between them. But J. Thomson shews that the capillary forces of the film of water which must (in these cases) be between the slabs (for without directly applied pressure the effect cannot be obtained with slabs of *dry* ice), are sufficient to produce the pressure requisite for the application of his mode of explanation.

This part of the subject cannot be said to be completely cleared up; but the theory of J. Thomson has been applied with perfect success to the explanation of the very extraordinary phenomena observed in Glaciers (q. v.), where enormous forces are constantly at work. It evidently at once accounts for the result of observation, due to Rendu and Forbes, that a glacier moves like a viscous fluid: in fact, it shews why and how the mass gives way to pressure, and how it is re-frozen in a new form, which in turn gives way to the new distribution of pressure. The explanation of the veined structure, the formation of clear ice from snow, &c., are all easily deduced from it.

The phenomena of regelation are easily seen in the making of snow-balls, which is well known to be impossible, by the hands at least, when the snow has been exposed to great cold, and is therefore dry. But, even in this case, the effect is easily obtained by the application of pressure sufficient to melt the ice, as is well seen in wheel-tracks, &c. By means of a Bramah's press, it is easy to convert a snowball into a sphere of perfectly clear ice.

REGENERA'TION is a theological expression denoting the spiritual change which passes on all men in becoming Christians. There are various interpretations of the mode and meaning of this change, but its necessity in some shape or another may be said to be admitted by all branches of the Christian Church. By all, man is supposed, as the condition of his becoming truly Christian, to pass from a state of nature to a state of regeneration, from a state in which he obeys the mere impulses of the natural life to a state in which a new and higher—a divine—life has been awakened in him. The words of our Lord to Nicodemus: 'Verily, verily, I say unto thee, except a man be born again, he cannot see the kingdom of God,' are accepted as the expression of this universal necessity by the Christian Church. It may be further stated that every branch of the Catholic Church recognises, although under very different conditions, the Holy Spirit as the author of this change. The change, in its real character, is spiritual, and spiritually induced. According to certain sections of the Christian Church, however, the change is inseparably involved with Christian baptism in all cases; while other sections do not acknowledge any essential connection between baptism and regeneration. In the view of the former, baptism constitutes always a real point of transition from the natural to the spiritual life. The grace of baptism is the grace of regeneration; the laver of baptism is the laver of regeneration, not merely in any formal sense, but in a real and living sense, so that every baptised person—or at least every rightly baptised person—has already become a Christian truly, although he may fall away from the grace that he has received. This is what is commonly called the High Church doctrine of regeneration. In the view of others, regeneration is a special, conscious process, which takes place independently of baptism, or of any other outward fact or ceremony. It implies a sensible experience—an awakening whereby men come to see the evil of sin, and the divine displeasure against sin, and, through the Holy Spirit, are born again, put away their former evil life, and begin to live a new divine life; and many Christians have spoken with rapture of this *experience*, of its thoroughness, its suddenness, its immediateness. There are different shades of opinion on the subject, some holding it as a condition of regeneration, that the regenerate should be able to recount, or at least give some precise idea of the time and manner of the change through which they have passed; others repudiating such views as savouring of fanaticism, yet holding no less to the spiritual definiteness of the change, independently of church forms of any kind; and such views, in contradistinction to the High Church doctrine, have received the name of Evangelical. The idea that regeneration is essentially involved in baptism, or identical with baptism, is supposed by many Christians to be a peculiarly unevangelical idea, opposed to the spirituality and freedom of divine grace.

RE'GENSBURG or RATISBON (Lat. *Reginum*, *Radespona*), the capital of the Bavarian province of Oberpfalz and Regensburg, is situated on the right bank of the Danube, at the mouth of the Regen, 65 miles north-north-east of Munich. Pop. (1867) 30,357. R., which was formerly a free city of the empire, and the seat of the German Diet, is pleasantly situated in the midst of a broad and fruitful valley, lying 1000 feet above the level of the sea. It presents a strongly-marked medieval character, with its ancient ramparts, fosses, and gates, and its narrow crooked streets, with their high, many-cornered, gabled houses, while it retains many interesting monuments of its importance and wealth during the middle ages. Among its 13 Roman Catholic churches, the most remarkable is the cathedral, begun in 1275, and not completed till the middle of the 17th c., which ranks, since its complete restoration in 1830, as one of the noblest specimens of German architecture, and is especially noteworthy for the fine monuments of its former bishops, and for the silver altar and numerous painted-glass windows, restored in 1830, with which it is adorned. The Church of St James of Scotland dates from the 12th c., and is built in the pure Byzantine style. The old town-hall was used for a century and a half as the place of meeting for the imperial diet. The royal library contains 60,000 volumes. The city has several highly ornamental fountains, and contains a monument to Kepler, who was a native of R., and who made many of his observations there. A stone bridge connects R. with the busy trading suburb of Stadt am Hof. The manufactures of R. include gold, silver, brass, and steel wares, paper, earthenware, beet-root sugar, brandy, and candles and soap of superior quality. Since 1853, it has been a free port; and in addition to ship-building, which is carried on with much activity, the trading community is extensively engaged in the transport of corn, wood, and salt. R., as the principal seat of the Danube Steam-navigation Company, is an especially busy trading port.

R., which ranks as one of the most ancient cities of Germany, and was built by the Romans, by whom it was named *Reginum*, was a place of considerable commercial importance in the early

ages of Christianity. In the year 750, a bishopric was founded here, which embraced a large portion of Bavaria and the Upper Palatinate. Under the Emperor Frederick I., it was relieved from the subjection under which it had previously stood to the dukes of Bavaria, and declared a free city. During the middle ages, it was the chief seat of the Indo-Levantine trade, and was one of the wealthiest and most populous cities of Southern Germany. From 1663 to the dissolution of the German empire in 1806, R. was, with a very short interregnum, the seat of the German Diet; and after undergoing various changes of fortune during the period of Napoleon's power, was finally ceded to Bavaria, of which it has since formed an integral part.

RE'GENT (Lat. *rego*, I govern), one who exercises the power without having the name of a king. In a hereditary monarchy, there are various circumstances which may necessitate the delegation of the sovereign power—as the devolution of the crown on a minor too young to be intrusted with the kingly office; the incapacity of the sovereign by illness, mental or bodily; and the case of absence from the realm. A regent under the title of Protector (q. v.) has often been appointed to exercise royal authority in the sovereign's minority, the latest instance in England being during the minority of Edward VI.; and regents and councils of regency have been sometimes named by the sovereign to provide for the probable nonage of his heir. According to Coke, the surest way of making such an appointment is by authority of the Great Council in parliament; and in recent times the appointment has generally been made by statute. During the frequent absences of the first two kings of the House of Hanover in their continental dominions, it was the practice to appoint regents or *Lords Justices* (q. v.) to exercise the powers of sovereign. In 1788, when George III. became incapacitated from exercising the kingly office by insanity, it became a question whether his eldest son, then of full age, had a right to be regent, or whether the nomination rested with parliament. The chief political authorities of the time were divided in their judgment, but the king's recovery ended the discussion. On the return of the malady, all parties were unanimous that the regency should be conferred on the Prince of Wales; this was done, however, by parliament, and for the first year of his regency, certain restrictions were imposed, which were to be removed in the case—which eventually occurred—of the king's continued illness.

In 1830, a Regency Bill was passed, providing for the administration of the government, should the crown descend to the Princess Victoria before she attained eighteen years of age; and in 1840, a Regency Bill (3 and 4 Vict. c. 52) was passed, providing that the late Prince Consort should be regent, in the event of the demise of the Queen, her next lineal successor being under age. During her present Majesty's various short absences from the country, there has been no delegation of the royal power.

REGENT OF A UNIVERSITY. In the university of Paris, where this as well as other learned distinctions originated, every Master of Arts possessed the privilege, which he was bound to exercise, of delivering public lectures. The same was the case at first in the universities of Oxford and Cambridge. In process of time, however—about the middle of the 13th c.—the title of Master became a degree attainable by any one after a certain amount of residence, and a certain proficiency, and the duty of lecturing was confined to a limited number of graduates, called *Regents*. The regents were eventually succeeded in the office of lecturing by the established professors. In the English universities, a Master of Arts becomes a regent after a short period; the regents form the governing body at Oxford and Cambridge, England. In the State of New York numerous private incorporated colleges and academies are to some extent regulated, assisted, and used by the state. They constitute collectively the University of the State of New York. The first are nominally, the latter really, under the supervision of the body known as the Board of Regents.

REGGE'LLO, a small town of Italy, in the province of Florence, and 16 miles east-south-east of the city of that name. It is surrounded by beautiful hills, which produce wines, fruits, and grains in abundance. Pop. 10,207.

RE'GGIO (anciently, *Rhegium Julii*), a seaport in the south of Italy, the chief city of the province of Calabria Ultra I., stands on the shore of the Straits of Messina, ten miles south-east of the city of Messina in Sicily. Population (1862) of the town proper, 15,692. It is well built; its streets are wide and regular, and it is surrounded by a wall flanked by towers. A fine cathedral, a hospital, and several educational institutions are the principal buildings. Manufactures of linens, stockings, silks, and odoriferous waters, are carried on. The fisheries of the vicinity are profitable, and abound in the Pinna (q. v.), a mollusc, the very delicate skin of which is made into gloves, stockings, and caps of great value. The climate of R. is salubrious, and the scenery of the vicinity exceedingly beautiful; the soil is rich, and produces fruit-bearing plants, both of the temperate and tropical zones, in great variety. Behind the city rises Aspromonte, a mountain of the Apennines, where Garibaldi was wounded in 1862.

The ancient *Rhegium* was founded by the Greeks, was governed wisely and justly by Anaxilas, and afterwards by his sons, 494—461 B. C. It was besieged and destroyed by Dionysius the Elder, rebuilt by Dionysius the Younger, and afterwards united to Rome.

REGGIO, a city of Central Italy, formerly belonging to the duchy of Modena, and now included in the province of Reggio, stands on the ancient *Via Emilia*, 16 miles west-north-west of the city of Modena. R. is situated on a fertile plain on the right bank of the Crostolo; is surrounded by a wall; contains beautiful palaces, and a fine cathedral of the 15th c. and other churches, which possess famous paintings; the *Teatro Nuovo*, one of the finest theatres in Italy; the lunatic asylum; a museum, an academy, and many other institutions. It is a rich city, and has manufactures of cotton, of cloth, and of other stuffs. Pop. (1862) of the town proper, 21,174.

RE'GIAM MAJESTA'TEM is the title given to an ancient collection of laws bearing to have been compiled by order of David I., king of Scotland. The authenticity of the work has been controverted, the prevalent opinion being that it is a compilation from the English work of Glanville, called the *Regiam Potestatem*, and that the publication of the book was an artifice of Edward I. to further his design of assimilating the Scotch law to that of England.

REGI'LLUS, LAKE, anciently a small lake of Latium, to the south-east of Rome, somewhere about the foot of the Tusculan hills. If Gell's conjecture as to its situation, be correct, it must have occupied an extinct volcanic crater at a place called Cornufelle, near the modern Frascati. Lake R. is celebrated in the semi-legendary history of Rome as the scene (496 B. C.) of a great battle between the Romans, under Aulus Postumius, and the Latins, on

behalf of the banished Tarquin, under O. Mamilius. The latter were entirely defeated, and an end, it is said, was put to the efforts of Tarquin to force his return to the city.

RE'GIMENT, in all modern armies, is a colonel's command, and the largest *permanent* association of soldiers. Regiments may be combined into brigades, brigades into divisions, and divisions into armies; but these combinations are but temporary, while in the regiment the same officers serve continually, and in command of the same body of men. The strength of a regiment may vary greatly even in the same army, as each may comprise any number of battalions. French and Austrian regiments have ordinarily 4 to 6 battalions. Among British infantry, the smallest regiments are those numbered from the 26th upwards (except the 60th), which, unless serving in India, have 1000 men each, composing one battalion. Regiments in India have 1200 men to a battalion. The 60th and Rifle Brigade comprise each 4 battalions and 4000 men. The largest regiment is the Royal Artillery, comprising 34,713 officers and men. The strength of a regiment, however, is changed from time to time; usually by the addition or withdrawal of private soldiers.

The regimental system could only exist where standing armies are maintained. Accordingly, the Macedonian syntagmata and the Roman cohorts were evidently regiments in a strict sense. During the middle ages, feudal organisation precluded the system, and its first reappearance was in France. Francis I. formed legions of 6000 men each, which were divided into independent companies, the latter being, in fact, battalions, and each legion a regiment. The word regiment began to be applied to bodies of British troops in Elizabeth's reign; regiments are spoken of at the time of the Armada, 1588, and as composing the force in Ireland, 1598. From that time forward, the army and militia of Britain have been organised into regiments. Charles I. and the parliament each raised regiments, all of which were disbanded at the Restoration, with the exception of the Lord-general's Regiment of Foot, and his Life Guard of Horse. These two were re-engaged (1661), and form the present Coldstream Guards and Royal Horse Guards. In the same year, a Scotch corps of 1700 men, which had taken service in France in the time of James I., returned to England, and was included in the British army as the 1st Foot. Other regiments of infantry were gradually raised as required. In 1693 was raised the 1st troop of Horse Grenadier Guards, and the 2d troop in 1702. These were disbanded in 1782, and re-formed as the 1st and 2d Life Guards, which still exist. Besides cavalry and infantry, the British army comprises regiments of artillery, engineers, and military train.

The total regiments of the British army for the year 1865—66, and by the estimates for 1870, were:

	Regiments.	Officers and Men. 1865—66.	1870.
Life Guards,	2	880	1,20:
Horse Guards,	1	440	
Cavalry of the Line—			
Dragoon Guards, 7			
Dragoons, 3	28	16,833	9,177
Hussars, 13			
Lancers, 5			
Horse Artillery,	1	5,743	17,127
Foot Artillery,		28,970	
Royal Engineers,	1	5,028	4,836
Military Train,	1	1,817	
Foot Guards,	3	5,953	5,910
Infantry of the Line,	110	137,780	61,392
Army Hospital Corps,	1	980	860
Commissariat Staff Corps,	1	602	2,195
West India Regiments (black troops),	4	3,467	1,934
Colonial Corps,	4	4,069	1,839
Total,	157	212,562	106,572

Each regiment is nominally commanded by a colonel, who is an old general officer, and whose office is merely a sinecure. The real command rests with the lieutenant-colonel in each battalion, who is assisted by two majors, and has for a staff an adjutant, a quartermaster, a paymaster, a surgeon, and one or two assistant-surgeons, according to the station. The regiment or battalion is divided into companies in infantry and engineers, into troops in the cavalry and the military train. The artillery is divided into 28 brigades, each of which is as large as an ordinary regiment. The brigade is subdivided into batteries. The working officers are captain, lieutenant, ensign to each infantry company; captain, lieutenant, cornet to each cavalry troop; captain, second captain, three lieutenants per battery of artillery.

The following table shews the allotment of the several ranks in each arm:

	Infantry Battalion of 12 Companies.	Cavalry Regiment of 8 Troops.	Field-Artillery Brigade of 6 Batteries.
Officers.			
Staff,	9	10	22
Companies, Troops, or Batteries,	36	24	40
Non-commissioned Officers.			
Staff,	9	11	8
Companies, &c.,	74	48	104
Rank and File.			
Corporals, &c.,	50	32	96
Privates,	750	464	1280
Total,	928	589	1548

It is to be observed that either of the above formations is augmented at once by the addition of privates, without any increase in the officers or non-commissioned officers. The new recruits being distributed among the troops or companies, as many as 300 could be received without sensibly impairing the discipline of the regiment. See UNIFORM.

REGIMENTAL SCHOOLS (British) are educational establishments, maintained by the state in every regiment, for the instruction of the soldiers and their children. There is a schoolmaster for the soldiers and elder boys; and a trained schoolmistress—usually the schoolmaster's wife—to teach the girls and infants of both sexes. Attendance at the schools is optional. Religious instruction takes place on Monday mornings, when children can be kept from school if their parents object to the instruction imparted. The girls' school comprises an 'industrial' section for needlework, &c. The charge for regimental schools for the year 1865—1866 was £31,661.

REGIOMONTA'NUS, the name adopted by an early German mathematician, called Johann Müller, probably because he was a native of Königsberg (of which *Regiomontanus* seems intended as a Latin equivalent), where he was born 6th June 1436. Which Königsberg, however, is to be understood, is a disputed point among his biographers, but Delambre and others favour the one in Franconia. R. was sent by his parents to Leipzig at the age of 12, and there made such rapid and extraordinary progress in mathematical studies, that by the time he was 16, he could find nobody, it is said, in the Saxon University competent to give him further instructions. He therefore removed to Vienna, where, in 1461, he became professor of astronomy, but was permitted to reside in Italy for some time, in order to study Greek, with the view of making himself acquainted with the writings of the Alexandrian geometricians and astronomers. He appears while here to have gone through a great amount of laborious work in the collection, collation, and copying

of Greek MSS., in studying the language (under the best masters, such as Theodore Gaza), making astronomical observations, lecturing to the students of Padua on the Arabian philosopher Alfragan, and composing his celebrated work, *De Triangulis Planis et Sphæricis* (first published at Nürnberg, 67 years after his death), which, according to Delambre, gives a very complete account of what was then known of plane and spherical trigonometry. In 1464, R. returned to Vienna, where he remained for some years in the discharge of his duties as professor; but afterwards removed to Buda, in Hungary, on the invitation of Mathias Corvinus. In 1471, he went to Nürnberg, where he lived in close intimacy with a wealthy and enlightened citizen, named Bernhard Walther, who furnished him, among other things, with means to start a book-printing establishment, and to construct various astronomical instruments, by which they were enabled to demonstrate the inaccuracies of the 'Alphonsine Tables.' Their united labours are to be found in the *Observationes* 30 *Annorum a J. Regiomontano et B. Walthero* (Nürnberg, 1544). R. now devoted himself vigorously to the composition of scientific works, among others, his *Kalendarium Novum* (ante 1475), which is thought to have been the first almanac that ever appeared in Europe. This last work excited great attention among the learned and powerful of the time, and the first edition was rapidly sold off. The king of Hungary presented R. with a gift of 800 or 1200 golden crowns. Pope Sixtus IV. now sought his assistance in his meditated reformation of the calendar, and, to secure his services, conferred on him the dignity of Archbishop of Ratisbon. He now left Nürnberg, and proceeded again to Rome, where, however, he died, 6th July, 1476, at the early age of 41. R.'s premature death was a serious loss to the science of mathematics. He is pronounced by competent authorities the most learned astronomer of his age; and his sagacity and ardour were such as to promise important acquisitions to our knowledge of celestial physics. A list of his numerous writings is given by Delambre in the *Biographie Universelle.*

REGISTRA'TION OF BIRTHS, DEATHS, AND MARRIAGES is an improvement introduced in modern times, and ingrafted on the law and social customs of the United Kingdom for the purpose of keeping an exact account of important facts connected with the population of the country and its social progress. In England, the first act for this purpose was passed in 1836, and a general registry-office was provided in London (at Somerset House) for England and Wales. But even before the new arrangement, there had been long in operation an ecclesiastical mode of registration of marriages, baptisms, and burials in connection with each parish church, the officiating minister being required to keep such a register. By that act, which still retains its force as to baptisms and burials, registers of public and private baptisms, and burials solemnised according to the rites of the Established Church in any parish or chapelry, are to be kept, and entries made, by the minister within seven days at least after the ceremony. These registers are to be transmitted annually to the registrar of the diocese, who keeps the same, and allows inspection on payment of certain fees—severe penalties being incurred by any one who forges or injures the register. This mode of registration was found to be insufficient for statistical purposes, for it was confined only to births and deaths, so far as the ceremonies of the church extended; and hence a systematic plan was instituted in 1836 by the acts 6 and 7 Will. IV. c. 85, 86, which have been since amended by subsequent acts. The head of the office is the Registrar-general. Every poor-law union throughout the country was subdivided into districts for the purposes of the acts. In each district, a registrar, locally resident, is appointed, and a superintendent-registrar is put over these.—1. As regards *Births*, it is the duty of the registrar to inform himself of every birth that takes place in his district, and to record the particulars without fee or reward, except such as the act authorises him to take. The forms of the register-books are all settled by the act of parliament, and include a statement of the date of birth, name (if any), sex; name and surname of the father, and name and maiden surname of the mother; rank or profession of the father; signature, description, and residence of the informant; date of registration; signature of registrar; and baptismal name of child, if added after registration. It is not incumbent on the parent or occupier of the house where the child is born to give information; but upon being requested to do so, they are bound, within forty-two days after the birth, to give the particulars touching the birth to the registrar. No fee is payable by the parent, &c., who gives information within the forty-two days. After that period, any person present at the birth, or the father or guardian, may, within six months, make a solemn declaration as to the truth of the particulars, and require the particulars to be registered; but he must pay a fee of 7*s.* 6*d.*, unless the delay was not occasioned by the party's fault. If registration is required to be made after forty-two days, and within six months, except as now stated, the party incurs a penalty of £50. After six months from the birth, the registrar is not allowed to register the birth under a penalty of £50, unless the child was born at sea.

2. *Marriages.*—With regard to marriages which are performed in the Established Church, every officiating clergyman is required, immediately after the office of matrimony solemnised by him, to register in duplicate the marriage according to a form prescribed by the statute, and one of the duplicates is to be forwarded to the superintendent-registrar. Every marriage in England which does not take place in a parish church or chapelry of the Established Church, must take place either in a registered building—and most of the chapels of dissenters are so registered—or in the office of the superintendent-registrar. In the two latter cases, it is necessary that the registrar be present in the registered building at the time, or that the superintendent-registrar be present in his office at the time with witnesses. In such cases, the registrar or superintendent-registrar himself registers the marriages so celebrated.

3. As to *Deaths*, every registrar is required to inform himself carefully of every death within his district, and he is bound to enter the particulars in the form required by statute. The occupier of the house in which the death occurs, if none of the parties present at the death shall have previously informed the registrar, must, within eight days after the death, on being requested, give such information. Four times every year, the district-registrar sends a certified copy of all the deaths to the superintendent-registrar, and when the book is filled, he sends the book itself. These are sent on, and kept in the General Register-house in London. At the general office in London, indexes are kept of all the certified copies of the registers, and every person is entitled, on payment of a fee, to search them, and have a certified copy. For a general search of all these indexes, a fee of 20*s.* is paid; for a search of a particular index, 1*s.* is paid, and 2*s.* 6*d.* for a certified copy. This certified copy is sealed with the seal of the office, and is evidence in all courts. During the time the register is in the hand of the superintendent-registrar, he is bound also to keep an index, charging a fee of 5*s.* for a general search, and 1*s.* for a particular search.

UNITED STATES.—In 1860 an act was passed by the Legislature of Pennsylvania providing for the registration of Births, Marriages, and Deaths in the

city of Philadelphia, the substance of which is as follows:

1. By this law it becomes the duty of clergymen, clerks, or keepers of records of all religious societies, and of every magistrate and other person before whom any marriage may be solemnised or contracted, of every practising physician, every practitioner of midwifery, of every undertaker, or superintendent or sexton of any cemetery or burial-ground in the city of Philadelphia, to report their names for registry at the office of the Board of Health.

2. Every physician is obliged to report within 48 hours the death of his patient, and the coroner to report cases that come under his notice to the undertaker or superintendent of burial, accompanied by a certificate setting forth the full name, sex, colour, age, condition, and cause and date of death; and no sexton is permitted to bury, or allow to be buried, or to remove beyond the limits of the city, the dead body of any person without first procuring the certificate of the physician or coroner. If a physician refuse to give a certificate, and the services of a coroner be not required, the Health Officer may give one on proper examination. Every physician who shall refuse or neglect to give the proper certificate shall forfeit and pay $5 for each offence, and every undertaker or sexton, &c., who neglects to perform his duty as provided in the act shall forfeit and pay for every offence $25.

3. Every person practising midwifery or superintending a birth must keep a registry of such birth, and enter it in a schedule furnished by the Health Officer; and if no physician or other person is in attendance, it becomes the duty of the parents to report its birth to the Health Officer in manner and form, and within the period, above required.

4. Every clergyman and every magistrate and clerk or keeper of records of all religious societies, and every other person before whom a marriage is solemnised or contracted, must make a faithful return of the same at the expiration of every three months to the Health Officer. Clergymen, physicians, or keepers of records, who shall refuse to perform their duties, shall pay a fine of $10.

The book of register or a certificate duly certified becomes *prima facie* evidence of a marriage, birth, death, &c., as the case may be, in any court of the State of Pennsylvania.

The results of the operation of this important law may be seen in the series of reports issued by the Board of Health, to which are appended the interesting and valuable reports of the Registration Department, under the charge of George E. Chambers, Registrar. We learn therefrom that from Jan. 1, 1861, to Jan. 1, 1871, there were recorded for each year an average of 16,418 births, 6051 marriages, and 15,706 deaths.

The highest number of births (17,437) was recorded in 1866, the lowest (14,741) in 1862. The highest number of marriages (7087) in 1866, the lowest (4417) in 1861. The highest number of deaths (17,582) in 1864, and the lowest (13,933) in 1867. Total births in 10 years and 6 months (1860—1870), 172,615; marriages, 62,824, and deaths, 163,411. Since 1866 the registration appears to have been more thorough, and a steady natural increase in the population is manifest.

The importance of a thorough and general registration of births, marriages, and deaths is but imperfectly understood and appreciated by the people. This is a source of great annoyance and loss, as it begets indifference to the duties on the part of parents, aldermen, clergymen, and physicians. The value of such records for a series of generations is well known to lawyers, and to all who have had occasion to trace a line of ancestry in order to establish rights, and who are subjected to great inconvenience in suits at law for want of the required certificates from an acknowledged registry. So perfect is the registry of London that the population in 1871 was thereby predicted to be almost identical with that shown by the recent census report, being only one-eighth of one per cent. removed from the truth.

It is to be regretted that the laws providing for registration at the founding of Pennsylvania were not fully and continuously enforced, and that those since enacted in Massachusetts, Connecticut, and Rhode Island were not established at a much earlier period. In the United States the law is found to work well, and professional men regard it as of the highest importance to the community and Courts of Record. See *Health Officer's Annual Reports*, 1860—71, G. E. Chambers, Registrar; *Twenty-seventh Report to the Legislature of Massachusetts relating to the Registry, &c.*, by Geo. Derby, M.D., Boston, 1870.

REGISTRATION OF DEEDS AND WRITS, in the law of Scotland, is an important feature of the administration of the law. The general registration is authorised either by virtue of a clause of registration inserted in a particular deed, or under the old act of parliament of 1698, c. 4, which applies to all probative writs whatever. The clause of registration arose from the practice of churchmen drawing the enforcement of ordinary contracts within their jurisdiction, by causing the parties to consent that the court should, as it were, execute diligence at once if the obligation were not fulfilled. The clause used to be in the form of an authority given to a procurator to go before a judge, and consent to a decree in terms of the obligation; but it is now enough to use this form: 'I consent to the registration hereof for preservation (or for preservation and execution).' Hence, when money is not paid at the time appointed, diligence issues at once on application of the creditor for execution. The practice is now almost universal to insert a clause of registration in deeds stipulating for money payments, especially bonds. When there is a clause of registration, the principal deed is retained in the register, and an attested copy or extract, authenticated by the clerk, and authorising diligence, is given out, and a copy of the deed is entered in a book. When the deed has no clause of registration, it is recorded as a probative writ only, and the principal deed is marked by the clerk, and returned with a certified copy, a copy being also kept in the record. The registration, under authority of a clause of registration, is called a registration for execution, and is in effect a short cut to a judgment without the formality of an action, and the registration may take place after the death of the creditor as well as of the debtor. The other registration is usually called a registration for preservation, the object being merely safe custody; but the extract or copy kept in the register is allowed to be evidence in all cases except where there is an action of improbation to reduce the original deed for forgery. The general register is separate from that of deeds containing clauses of registration, and is applicable to all writs of which it is useful to preserve a copy.

Another class of registers has for its object publication to all the lieges, which is effected by allowing inspection to the public, and these writs are those connected with heritable rights, being used by all who lend money on land, or purchase land. There is under this class (1) a register of sasines—i. e., of the final deeds completing the title to property, and vesting it in the owner; (2), a register of entails—i. e., of deeds which perpetuate the enjoyment of land by a specified class of heirs; (3), a register of interdictions—i. e., by which a proprietor of heritage limits his own power of alienation; (4), a register of adjudications—i. e., transfers by operation of law;

(5), a register of inhibitions—i. e., of diligence restraining an owner of land from alienating it to the prejudice of creditors; (6), a register of inventories, by which heirs limit their liability to the amount of their ancestors' assets. By the combined effect of these registers, the state of heritable property, as affected by incumbrances, is displayed to all parties who are interested in ascertaining that fact, and the practice has been found of great benefit to the landowners of Scotland. Besides the general registers for all Scotland, there are also local registers in every county and burgh for similar purposes; some of these local registers remain permanently there, but others are transmitted at intervals, when books or volumes are made up, to the General Register House in Edinburgh. The general result of the Scotch registration system is, that deeds and all other writings may be registered for preservation either in the central register in Edinburgh, or in the provincial registers; that deeds containing clauses of registration with consent of execution, as well as protests of bills of exchange, may be registered for preservation and also for execution in the Books of Council and Session, or in the registers of the subordinate courts; and that all deeds, instruments, and proceedings affecting heritable property must be registered, so that any one can ascertain the burdens affecting it, by inspecting the burgh register as to burgage property, and as regards all other property by inspecting the General Register in Edinburgh, where the whole of the general and particular registers are ultimately concentrated. At the head of the management of these public registers is the Lord Clerk Register, by whom and by his deputy and officers the details of registration are carried out. The General Register House in Edinburgh, in which are collected all these records, was completed in 1787, a general principle of the management being, that the formation of the records is intrusted to one set of officers, and the safe custody of them to another set. so as to provide a better check on the whole process.

RE'GIUM DO'NUM (Lat. royal gift), an annual grant of public money in aid of the maintenance of the Presbyterian and other dissenting ministers in Ireland. It began in 1672, when Charles II. gave £600 of secret-service money to be distributed annually among the Presbyterian clergy in Ireland, on hearing that they had been loyal to him, and had even suffered on his account. The grant was discontinued in the latter part of the reign of that monarch, as well as in the time of James II., but was renewed by William III., who increased it to £1200 a year. It was further augmented in 1723 by George I., in consequence of the Presbyterians having supported the House of Brunswick; raised to £2200 in 1784, and to £5000 in 1792. The amount of the grant for 1863 was £39,746. The ministers who lately shared the Regium Donum were those of the Presbyterian, Independent, and Baptist persuasions. The propriety of receiving the Regium Donum was much disputed by those of the same persuasions in England and Scotland. By act of Parliament (1869) the Regium Donum was to cease January, 1870, provision having been made for compensating the Presbyterians who were in receipt thereof.

RE'GIUS PROFESSOR, the name given to the professors in the English universities whose chairs were founded by Henry VIII. In the universities of Scotland, those professors are called Regius Professors the patronage of whose chairs is vested in the crown.

RE'GLET, a flat narrow moulding rising equally on both sides. It is used to separate panels, and to form frets, &c.

REGNAULT, Henri Victor, a distinguished living French chemist and physicist, was born at Aix-la-Chapelle in 1810. While still very young, he was left to provide for himself and his sister, came to Paris, and became a shopman in a bazaar. He made such good use of his scanty leisure, that he qualified himself for admission (in 1830) to the Ecole Polytechnique, and, after the two years' course, came out as a mining engineer. He became a professor in Lyon, whence, in 1840, he was recalled to Paris as a member of the Academy of Sciences, in consequence of some important discoveries in organic chemistry. Having filled chairs in the Ecole Polytechnique and the Collége de France, he became, in 1854, director of the imperial porcelain manufactory at Sèvres.

He is distinguished for extreme skill and patience in experimental work, more than for brilliance or novelty in discovery; and has devoted himself especially to the determination of important physical data, such as the laws of expansion of gases, the measurement of temperature, latent and specific heats, &c. His greatest work is that, undertaken by direction of the French government, on the numerical data bearing on calculations connected with the working of steam-engines, which forms the 21st volume of the *Mémoires de l'Académie des Sciences*. He has also published, in addition to numerous papers in the *Annales de Chimie*, &c., *An Elementary Course of Chemistry* (4 vols. 12mo), a really excellent work.

REGRA'TING. See Engrossing.

RE'GULA, a band under a Triglyph (q. v.) in the Doric style, or the bands between the canals of the triglyphs.

REGULAR CANONS (Lat. *Canonici Regulares*, canons bound by rule), the name given, after the reform introduced into the system of cathedral clergy in the 11th c., to the members of those canonical bodies which adopted that reform. They were thus distinguished from the so-called 'secular canons,' who continued exempt from rule, and who are represented down to modern times by the canons, prebendaries, and other members of cathedral chapters, in those churches, in which the full cathedral system of the Roman Catholic Church is maintained. The rules of the regular canons being variously modified in different countries and ages, a variety of religious orders arose therefrom, Augustinians, Premonstratensians, &c. See Canons, Augustines.

REGULAR PLANE FIGURES are those surfaces whose perimeters are equilateral and equiangular polygons. They are named according to the number of sides which compose the perimeter, being triangles, squares, pentagons, hexagons, &c., according as they have 3, 4, 5, 6, &c. sides respectively; and to all except the *Square* (q. v.) the prefix 'regular' or 'equilateral and equiangular' is applied, to distinguish them from other plane figures which have an equal number of sides, but have not all the sides and angles equal. Circles can be inscribed in and described about all regular figures. See Polygons. *Regular bodies, solids, or polyhedrons* are those solids whose sides are plane figures, all the plane figures being equal, similar and regular. The number of such bodies is necessarily very limited; in fact, no more than *five* such bodies are possible. They are the tetrahedron, hexahedron or *cube*, octahedron, dodecahedron, and icosahedron. The sides or faces of the first, third, and fifth of these solids are equilateral triangles; those of the second are squares; and those of the fourth are regular pentagons. From these five regular solids having been treated of, or described by Plato, they are

generally known as the Platonic bodies, or Plato's five solids.

REGULARS, REGULAR CLERGY (Lat. *regulares*, from *regula*, 'persons bound by rule'), a name used to designate that portion of the clergy, in the Catholic Church, who belong to the monastic orders or religious congregations, and thus live under an established rule, commonly including the three vows of poverty, chastity, and obedience. The name Regular is employed in contradistinction to 'secular,' the term applied to the clergy who are employed in the ordinary parochial duties, or at least who are not withdrawn from liability to such duties, by being subject to any religious rules or constitutions. The name, therefore, comprises all friars, monks, regular canons, clerks of the missions, and, in general, all members of clerical congregations who live under an approved rule.

REGULATIONS, Military and Naval, are the official codes of rules for the guidance of officers in all the cases where uniformity of practice is requisite, and which cannot rightly be left to individual discretion. Regulations may be divided into three classes: viz., those affecting drill, discipline, and finance. Of the first class are such as cavalry regulations, infantry field manual, naval gun drill, &c. Of the second are the Mutiny Act (q. v.), Articles of War (q. v.), and Queen's Regulations (q. v.). The third class are represented by the War-office regulations, purveyors' regulations, explanatory directions for paymasters, navy paymasters' regulations, &c. All these are continually supplemented and altered by circulars.

RE'GULUS. See Golden-crested Wren.

REGULUS, a term in Metallurgy, which is now used in a generic sense for metals in different stages of purity, but which still retain, to a greater or less extent, the impurities they contained in the state of ore. When, for example, the ore known as the sulphuret of copper is smelted, the product of the different furnaces through which it passes is called regulus until it is nearly pure copper. The name, which signifies 'little king,' was first given by the alchemists to the metal antimony, on account of its power to render gold brittle.

REGULUS, Marcus Atilius, a favourite hero with the Roman writers, was consul for the first time 267 B.C., and for his successes against the Sallentini, obtained the honour of a triumph. Chosen consul a second time 256 B.C., he was sent along with his colleague L. Manlius Vulso at the head of a navy of 330 ships (with a land army on board) against the Carthaginians, it being the 9th year of the first Punic War, and encountering the enemy's fleet off Heraclea Minor, he totally defeated it. The Romans then landed near Clypea, where they established their headquarters, and ravaged the surrounding Carthaginian territory with fire and sword, but Manlius being recalled to Rome with one half of the land forces, R. was left to carry on the war with the remainder. For some time he was victorious in every encounter, but at last (255 B.C.) suffered a total defeat; 30,000 Romans were left dead on the field, about 2000 fled and took shelter in Clypea, and R., with 500 more, was taken prisoner. R. remained in captivity for five years, but when fresh reverses induced the Carthaginians to solicit peace, R. was released on parole and sent to Rome in company with the Punic envoys. The rest of his history is one of the most favourite of Roman tales. It is related, *con amore*, by the Roman poets and historians, as an instance and a model of the most supreme heroism, how R. at first refused to enter Rome since he was no longer a citizen; how, after this conscientious scruple was overcome, he declined to give his opinion in the Senate, till that illustrious body laid upon him its commands to do so; how he then earnestly dissuaded them from agreeing to any of the Carthaginian proposals, even to an exchange of prisoners (though no reason appears why such an exchange should not have been effected); and how, after he had succeeded by his earnest appeals, in obtaining the rejection of the Carthaginian offers, he resisted all persuasions to break his parole, though conscious of the fate that awaited him, and, refusing even to see his family, returned with the ambassadors to Carthage, where the rulers, maddened by the failure of their schemes through his instrumentality, put him to death by the most horrible tortures. The common story is, that he was placed in a cask or chest stuck full of nails with the points projecting inwards, and rolled about till he expired; and on the news of this event reaching Rome, retaliations equally atrocious were committed on two of the noblest Carthaginian prisoners. Unfortunately this noble instance of heroic patriotism and unflinching fortitude has not even been noticed by Polybius (about 200 B.C.), who details at great length the other achievements of R.; and Palmerius (Paulmier de Greutesmesnil) and Beaufort, two eminent historical critics, have adduced strong reasons for the story being merely invented for the purpose of excusing the horrible treatment of the captive Carthaginians. Niebuhr roundly declares it to be a forgery, and believes that R. died a natural death; though, excepting the silence of Polybius (which would be utterly unaccountable on the supposition of the mode of his death being the same or similar to what is stated in the common account), there appears to be no reason to doubt the statement in which all the other Roman historians agree, that he was put to death by the Carthaginians.

REGUR, the native name for the cotton-soil of India. It is a rich darkish loam, which has yielded a constant succession of crops—one of cotton, and two of corn—for twenty centuries. It covers extensive level tracts in the southern peninsula, varying from 3 to 20 feet in thickness.

RËI, REE, or REA, the nominal unit of account in Portugal and Brazil, but no longer existing as a coin; multiples of it, however, still form the authorised coinage in both countries. In Portugal, copper pieces of 5, 10, and 20 (*vintem* = 1*d.* nearly) reis, silver coins equivalent in value to 50, 100 (*testoon*), 200, 480 (*cruzado novo*), 500, and 1000 (*milreis*) reis, and gold pieces of 1000, 2000, 4000 (*moeda douro*), 5000, 6400, 10,000 (gold crown), and 12,800 (*dolra*) reis, are the current coin of the realm; but accounts are kept almost exclusively in milreis and reis. In Brazil, since 1832, no copper coins have been struck; and in that country only silver coins of 500, 1000, and 2000 reis, and gold pieces of 10,000 and 20,000 reis, are coined. The milrei in Brazil is, however, only equivalent to about 2*s.* 3*d.* sterling; while that of Portugal is more than twice this value, the exchange at present being about 4*s.* 9*d.* sterling.

REI'CHENBACH, a flourishing manufacturing town of Saxony, 11 miles south-west of Zwickau. It contains a large cotton-spinning mill, stoneware, and other factories; and produces extensively woollen fabrics, leather, nankeens, lace dresses, damask napkins, waistcoatings, and hosiery. The greater part of the machinery in the town and vicinity is driven by steam. Pop. 11,713.

REICHENBACH, a town of Prussian Silesia, on the right bank of the Peilbach, romantically situated at the foot of the Eulen Mountains, 46 miles by railway south-east of Liegnitz. It contains six cotton factories, and carries on linen and woollen

manufactures, yarn bleaching, dyeing, and printing. Pop. 6590.

REICHENBACH, KARL, BARON VON, a German naturalist and technologist, was born at Stuttgart, the capital of Würtemberg, 12th February 1788, and educated at Tübingen, where he received the degree of Ph.D. Soon after he conceived the project of founding a new German state in the South Sea, but his plans were watched by the French authorities, and being suspected to have some hidden political significance, their author was arrested and imprisoned for some time in the fortress of Hohensperg. On his release he turned his attention to the natural sciences, and their application to the industrial arts, visiting the principal manufactories of Germany and France, and on his return he established at Vilingen and Hausach kilns for the production of wood-charcoal. In 1821, in connection with Hugh, Count of Salm, he commenced a number of manufactories of different kinds at Blansko in Moravia, which were carried on under his own superintendence. R.'s management was so economical and effective, that the concern soon became extremely profitable; and R., after a few years, was the possessor of a handsome fortune, which he invested in the purchase of large estates, including the château of Reisenberg, where he kept his magnificent collection of meteorites; he was about the same time created a baron by the king of Würtemberg. R.'s position as manager of the works at Blansko afforded him valuable opportunities, which were not neglected, for scientific investigation, and the numerous new facts thus brought to light have been of great value to science and art. From the nature of the works, the objects which chiefly presented themselves to his investigation were the compound products of the distillation of organic substances, and by careful analysis he succeeded in bringing to light a number of compounds of carbon and hydrogen not previously known. Among these were creosote (1833), and paraffin (q. v.). In later years he launched out into speculations of a wholly different character. Studying with enthusiasm the subject of animal magnetism, he discovered, as he thought, a new force in nature. See OD. His chief literary works are, *Geologische Mittheilungen aus Mähren* (Vienna, 1834), the first geological monograph published in Austria; *Physikalisch-physiologische Untersuchungen über die dynamide des Magnetismus und der Electricität, und ihre Beziehungen mit der Lebenskraft* (Brunswick, 1847—1849); several other works on 'odic force,' published at Stuttgart between 1852 and 1856; and in the *Neues Jahrbuch der Chemie und Physik* may be found several papers by R., in which he describes his various chemical discoveries; he also wrote the *Kohlerglaube und Afterwissenschaft* (1856), in reply to be a work of Karl Vogt. He died on Jan. 19, 1869.

REI'CHENBERG, the third town in population in the kingdom of Bohemia, stands in the middle of the most populous and industrious district of the Austrian monarchy, in a romantic valley on the Neisse, 52 miles north-north-east of Prague. Linen, cotton, and woollen fabrics are manufactured extensively, as well as fire-arms, hats, leather, shoes, gold and silver wares, musical instruments, &c. The annual value of the goods manufactured at R. is estimated at over £400,000. Pop. 22,394.

REI'CHENHALL, a small town of Bavaria, on the Saal, 8 miles south-west of Salzburg. It was almost wholly consumed by fire in 1834, and has been handsomely rebuilt since that time. It is the centre of the Bavarian salt-works, and in the manufacture of salt, its inhabitants—about 3000 in number—are for the most part employed. Of its 18 salt-springs, which burst forth about 50 feet below the surface of the ground, and to which a spacious shaft has been sunk, some are so strong in the brine as to be fit for boiling at once; but generally speaking, they are subjected to a preliminary evaporating process. The strongest and most abundant spring, containing 24 per cent. of salt, and yielding 3300 cubic feet of water every 24 hours, is perhaps the most copious salt-spring in the world. From it alone about 200,000 cwts. of salt are obtained annually. A brine conduit, 60 miles in length, conveys the water of salt-springs from Berchtesgaden, through R., over mountains nearly 2000 feet high, to Traunstein and Rosenheim, in the vicinity of which abundant timber for fuel is procurable.

REICHSTADT, NAPOLEON FRANÇOIS CHARLES JOSEPH, DUKE OF, described by the Bonapartists as NAPOLEON II., was the son of the first Napoleon by Maria Louisa of Austria, and was born at Paris, 20th March 1811. His father's joy at his birth was unbounded. '*C'est un roi de Rome*,' he cried to the crowd of congratulators who pressed into his apartments on hearing the news. The infant prince was baptised on the 9th of June in the cathedral of Notre Dame by Cardinal Fesch. After the reverses of 1814, Napoleon, it will be remembered, abdicated in favour of his son, but the Senate took no notice of Napoleon II., and called Louis XVIII. to occupy the French throne; whereupon Maria Louisa and her child removed to the palace of Schönbrunn, near Vienna, where they remained till the treaty of Vienna had rearranged the affairs of Europe. Maria Louisa then proceeded to take possession of the sovereign duchy of Parma, which had been conferred upon her, while her son continued to reside at the Austrian court with his grandfather Franz I., who was much attached to him. By an imperial patent, dated 22d July 1818, he was created Duke of R., with the rank of an Austrian prince, and received a liberal education, but never enjoyed robust health, nor exhibited a vigorous intelligence. At the July revolution in 1830, his name was mentioned as a candidate for the French throne, and Talleyrand, it is even believed, proceeded to Vienna for the purpose of advocating his cause, but was coldly received, and the project dropped. Destiny had indeed determined otherwise. The constitution of the poor youth was utterly undermined by laryngeal phthisis, and on the 22d July 1832 he expired at Schönbrunn. His last words, addressed to his mother, were very touching as an expression of almost childish despair, '*Ich gehe unter, meine Mutter, meine Mutter!*' He was interred with magnificent pomp in the imperial tomb at Vienna.

REID, THOMAS, was born on the 26th April 1710, at Strachan, a country parish in Kincardineshire, where his father was minister. His mother belonged to the well-known family of the Gregories (q. v.). R. began his education at the parish-school of Kincardine, and at the age of 12 he became a student of Marischal College in Aberdeen. His master in philosophy was Dr G. Turnbull, one of the earliest representatives of the properly Scottish school. He took his degree of M.A. in 1726, and continued to reside in Aberdeen as college librarian, his chief studies being mathematics and the philosophy of Newton. In 1736, he left Aberdeen, and went, in company with a friend, to England, where he was introduced to the most distinguished men in Oxford, Cambridge, and London. In the following year, he was presented by the senatus of King's College to the parish-church of New Machar in Aberdeenshire. The parishioners were bitterly opposed to his appointment, but his conduct and manner gradually won them over. It is said that, from distrust of

his powers, instead of composing for the pulpit himself, he preached the sermons of the English divines Tillotson and Evans. In 1740, he was married to a cousin of his own, who greatly aided him in the work of his parish. In 1739, Hume's *Treatise on Human Nature* appeared; the perusal of which gave the impulse that determined his future philosophical career. He had fully adopted the idealism of Berkeley, but was now revolted by the conclusions drawn from it by Hume, and in consequence was led to seek a new foundation for the common notions as to a material world. In 1748, he contributed to the Royal Society of London a short essay on *Quantity*, occasioned by what he considered an abusive application, by Hutcheson, of the forms of mathematical reasoning to ethics. In 1752, he was appointed one of the professors of philosophy in King's College, Aberdeen, the senatus being the patrons of the chair. Here he followed the established course of teaching in three successive years to the same students, mathematics, natural philosophy, and moral philosophy. He took an active part in all the business of the university. He was also the founder of a Literary Society in Aberdeen, which enrolled among its members, Campbell, Beattie, Gerrard, and other men of ability; to this society he submitted his first draft of the *Inquiry into the Human Mind*. In 1763, he was chosen to succeed Adam Smith as professor of moral philosophy in the university of Glasgow. He was now rescued from the necessity of teaching physical science, and devoted himself thenceforth to metaphysical and mental speculation. In 1764, he published his *Inquiry*. His thirst for general science never left him; at the age of 55, he attended Black's lectures on Heat. He continued in the duties of his chair till 1781, when he retired to devote his remaining strength to the publication of his works on the mind. In 1785, the *Philosophy of the Intellectual Powers* appeared; and in 1788, the *Active Powers*. These treatises must always be looked upon as constituting the first complete and systematic work on the science of the human mind. In 1774, he had contributed his account of Aristotle's logic to Lord Kames's *Sketches*. The publication of the *Active Powers* was the close of his career as an author, although to the end of his life he kept up his bodily and mental vigour, and his interest in science. His only surviving daughter had married the son of Gershom Carmichael (the real founder of the Scottish school of philosophy); she it was that, after the death of his wife in 1792, cared for him in his last years. He was taken ill suddenly in the autumn of 1796, and died on the 7th October. He was under the middle size, but had great muscular strength, and was addicted to exercise in the open air.

R. had many points of resemblance to his great contemporary Kant. Both were occupied up to middle life with mathematical and physical studies; both were roused to metaphysical research by Hume, and each became in his own country the chief of a school whose aim was to deliver philosophy from scepticism, and to do so by resting finally on principles of intuitive, or *à-priori* origin.

R.'s refutation of Berkeley, notwithstanding the powerful support of Hamilton, is now considered by many to be a failure. His own account of the motives that led him to abandon Idealism, proves that he completely misconceived the real drift of that famous speculation.

REI'GATE, a parliamentary borough and thriving market-town of Surrey, pleasantly situated at the southern base of the North Downs, 23 miles south of London by the South-eastern Railway. From very early times, it was considered a place of strength; and after the Conquest, it was granted to the Earls of Warrenne. Of the castle built by these earls, only very slight vestiges remain; but beneath the site are several large vaults or caverns, excavated in the sandstone not earlier than the 13th century. The church is in various styles of architecture—the oldest portions dating from the 12th century. Under its chancel is buried Charles Howard, Earl of Effingham, Elizabeth's Lord High Admiral, and the conqueror of the Spanish Armada. One member is returned to parliament for the borough. Pop. in 1851, 4927; in 1861, 9975.

REIGN OF TERROR, the name given to that period in the history of France when the revolutionary government, under the guidance of Maximilien Robespierre, supported itself by the pure operation of terror, exterminating with the guillotine all the enemies, or supposed enemies, of the democratic dictatorship. In the year 1793, the Convention vested the government in a 'Committee of Public Safety,' a body belonging to the party of the Mountain, and of which Robespierre, Couthon, and St Just became the triumvirate. This Committee, to which every other authority in the country was subjected, deliberated in secret, and the Convention sanctioned all its decrees. Louis XVI. had already been brought to the scaffold; and on October 16, his queen, Marie Antoinette, after being subjected to every possible indignity, was beheaded; the Princess Elizabeth sharing the same fate on 10th May 1794. The execution of the Girondists (q. v.) followed, and that of the Duke of Orleans. The guillotine became the only instrument of government: a look or a gesture might excite suspicion, and suspicion was death. The Calendar was remodelled, and all religious rites suppressed. When the power of the Committee had attained its climax, a decree was passed abrogating every delay or usage calculated to protect an accused person; but from that moment a reaction began. A section of the Mountain party were satiated with blood, and had become impatient of the control of Robespierre. On July 28, 1794, he was denounced in the Convention for his barbarities, and his death (see ROBESPIERRE) brought to a close this sanguinary era in French history.

REI'KIAVIK. See ICELAND.

REIMARUS, HERMANN SAMUEL, a German philologist of high eminence, was born in 1694 at Hamburg, where his father was Professor at the Johanneum Gymnasium. He visited the universities at Jena and Wittenberg, travelled afterwards in Holland and England, and was, on his return, elected Rector at Wismar, and subsequently Professor of Hebrew and Mathematics at the gymnasium of Hamburg. He died there in 1765. He is the author of the so-called 'Wolfenbüttelsche Fragmente eines Unbekannten,' first published by Lessing in his *Beiträge zur Geschichte und Literatur aus den Schätzen den Wolfenbüttelschen Bibliothek*. These 'Fragmente,' up to that time only known in MS. by a few of R.'s most intimate friends, produced the profoundest sensation throughout Germany: since in them, the author, in the boldest and most trenchant manner, denied the supernatural origin of Christianity. Another work, in the same direction, is his *Vornehmste Wahrheiten der Natürlichen Religion;* of a miscellaneous character are his *Primitia Wismariensia, De Vita Fabricii, Dissertatio de Assessoribus Synedrii Magni*, &c. His edition of *Dio Cassius* is one of the most valuable contributions to classical philology.

REINDEER (*Cervus tarandus* or *Tarandus rangifer*), a species of Deer (q. v.), a native chiefly of the arctic regions; by far the most valuable and

important of all the species of deer, and the only one which has been thoroughly domesticated and brought into service by man. It is found wild in Europe, Asia, and America, in Spitzbergen, and in Greenland. It is not, however, a native of Iceland, but was introduced into that island by Governor Thodal in 1770, and soon became thoroughly naturalised; great herds now roaming over the wildest parts of the interior, but approached with difficulty

Reindeer (*Cervus tarandus*).

by the hunter, and of little value to the inhabitants. It is not there known as a domestic animal. The R. attains its greatest size in the arctic regions; and in Western Europe it is not found very far to the south of the arctic circle; but in Siberia and in America its range extends much further to the south, almost to the latitude of Quebec in America; and in the west of Asia, along the whole chains of the Ural Mountains, and even to the south of Astrakhan, almost to the Caucasus.

The wild R. of Lapland is almost equal in size to the stag, but there are great differences of size in different districts, the largest size being generally attained in very polar regions. The domesticated R. is never so large as the largest wild ones; but the domesticated R. of Siberia is, like the wild one, much larger than that of Lapland. The R. is very inferior in gracefulness to the stag, and, indeed, to most species of deer, being of a rather heavy appearance, with comparatively short and stout limbs, the withers much elevated as in the elk, and the neck carried almost straight forward. The tail is very short. There is little or no mane, but the hair of the lower part of the neck is very long and shaggy. Both sexes have large horns, those of the male being larger, and often more than four feet long. They are slender and cylindrical almost to the tip in young animals, but in old ones become palmated there, although still slender and cylindrical at the base; they are more or less branched, and from the base spring one or two branches, comparatively short, but also in old animals much palmated, so that the armature of the head is of a very peculiar appearance. The R. is said to use its horns to remove the snow from the lichens which form great part of its winter food; it also scrapes up the snow with its feet and turns it up with its snout; and by a beautiful provision of nature, the feet, forehead, and nose are protected by a remarkably hard skin. The R. is gregarious, partially migratory—its migrations, however, not being regulated by climate, but by the facility of obtaining food. To the Laplander the R. constitutes the chief part of his wealth; and many Laplanders possess herds of 2000 and upwards, which they feed chiefly in the mountainous tracts in summer, and in the lower grounds in winter. The flesh is excellent, as is also the milk, which is much used. The skins are used for clothing, tents, and bedding. The hard skin of the face and feet is much valued by the Laplanders for making shoes. The R. is also extremely valuable as a beast of draught, for which purpose it is harnessed to sledges. It is capable of maintaining a speed of nine or ten miles an hour for a long time, and can easily draw a weight of almost 200 lbs. besides the sledge. It is much employed for this purpose in Siberia as well as in Lapland; but in America, it is merely an object of chase, valued for its flesh, fat, and hide. Among other methods resorted to by the Esquimaux and other Indians for its capture is that of making pits in the snow, covered with a slab of ice, which revolves on its own centre when the R. sets foot on it. The flesh and fat are made into Pemmican (q. v.), besides being used in a fresh state. A very thick layer of fat lies under the skin of the back of the male. The American R. is called the CARIBOU, and is sometimes regarded as a distinct variety, but the differences are very slight. Although the R. has been found to live for years when brought to Britain, the climate does not seem suitable to it.

The R. suffers grievously during summer from the attacks of various kinds of insects, and particularly of a species of Bot (q. v.), which is sometimes not merely tormenting but destructive.

REINDEER MOSS (*Cenomyce rangiferina* or *Cladonia rangiferina*), a lichen of great importance to the Laplanders and other inhabitants of the northernmost regions of Europe and Asia, as forming the chief winter food of the reindeer. It is found in almost all parts of the world, but is most abundant and luxuriant in the arctic regions. It is common in Britain, growing in moors and on mountains. It covers extensive tracts in Lapland and other very northern countries, making them even in summer as white as snow, and often thus occupies the ground in pine forests. When pine forests are destroyed by fire, it soon springs up in its greatest luxuriance. It is a very variable plant, but always consists of a much-branched erect cylindrical tubular thallus, with small perforations in the axils. It attains a height of two inches and upwards. The branches of plants which grow together usually mix very intricately into one mass. The importance of this lichen was first brought into notice by Linnæus in a beautiful passage of his *Flora Lapponica*. The reindeer reach it by scraping with their feet, even when it is covered with very deep snow. It is capable of being used for human food, and was recommended for this purpose in times of dearth by an edict of Gustavus III. of Sweden. Its taste is pleasant, although attended with a slight pungency or acridity. It is generally boiled in reindeer milk. Its nutritious qualities depend chiefly on the Lichenin (q. v.) which it contains.

REINFO'RCE, FIRST and SECOND, in Guns, are the two sections of the length which come next the breech. The gun is made thicker at these parts, so as to resist more effectually the explosive action of the powder. The thickness of metal is less at the second reinforce than at the first, the powder being considered to have already exerted its greatest disruptive force. The conclusion is, however, open to dispute. The first and second reinforce are shewn (with their reinforce rings) at AC, CD in the figure under GUN.

REIS EFFE'NDI, the title of one of the chief officers of state in the Ottoman empire. He is the Chancellor of the empire, and Minister of Foreign

Affairs. His duty in the first-mentioned capacity is to confer with the grand-vizier regarding the orders and instructions to be sent to the different provinces, and regarding the proper decision on any subject affecting the empire, whether internal or external; and in the latter capacity, he has the sole and exclusive charge of the relations of the Porte with foreign courts.

REJOI'NDER, in English law, means the pleading of a defendant in answer to a plaintiff's replication. The order of pleading is declaration, plea, replication, rejoinder, surrejoinder, rebutter, surrebutter, &c.—each party alternately delivering one of these pleadings.

RELA'PSING FEVER is one of the three great species of continued fever common in this country, the two others being typhus and typhoid. Although the disease has been accurately described by several physicians during the last century (since 1739), its present name was given to it only about 1850 by Dr Jenner. It had previously been vaguely known under the various names of *five-day fever*, *seven-day fever*, *mild yellow fever*, *short fever*, *short relapsing fever*, &c., and has often been confounded with common continued fever. It has attracted special notice since 1843—1844, when there was prevalent in Scotland 'an epidemic fever characterised by the suddenness of its onset, its wide diffusion, its short duration, and its small mortality; by its proneness to relapses, by the frequent occurrence of petechiæ, of something like black vomit, and of yellowness of the skin; by the absence of intestinal ulcers; and by profuse sweatings, whereby the fever seemed to be solved.' This fever was supposed at the time by Alison and other eminent physicians who described it, to have been a new and hitherto unknown pestilence; but Jenner's subsequent researches shewed, as has been already mentioned, that in this respect they were in error; epidemics of this kind having previously occurred in Scotland or Ireland (or both simultaneously) in 1736, 1739—1741, 1800—1801, and 1816—1820.

Relapsing fever usually begins suddenly with rigors, a sense of chilliness and frontal headache. Febrile reaction soon sets in; the tongue is coated with a thick moist whitish fur; and the skin is often so yellow as to approach to jaundice (a phenomenon that never occurs in typhus or typhoid fever). By the fifth or sixth day, there is usually delirium. After the above-described symptoms have lasted for a period varying from five to eight days, generally on the seventh day, a sudden change takes place. This change commences with a copious perspiration, which is followed by a rapid falling of the pulse to its healthy rate (or even lower), and the patient appears nearly well. But from the fifth to the eighth day of this seeming convalescence, a sudden relapse occurs, and all the primary symptoms return; these run a rather shorter course than before, and again terminate in sweating and in a second convalescence, which is in most cases permanent. The relapse sometimes, however, occurs three or even four times.

Death is a rare termination of relapsing fever; and when it does occur, it is usually before the seventh day of the disease. No special anatomical lesion is observed in the bodies of those who succumb to this disease, but enlargement of the spleen is by no means uncommon.

The treatment to be adopted is simple. The bowels should be opened at the commencement of the attack by calomel and rhubarb, and if necessary, kept open subsequently with castor-oil or saline aperients. The headache must be encountered by leeches or cupping, if the patient is robust; and by blisters or dry cupping, if he cannot bear the loss of blood. The vomiting is often hard to check: if effervescing draughts fail, it may sometimes be combated by calomel and opium combined in pills.

Its cause is unknown, but it mainly attacks the poor and the ill-housed and ill-fed. Its poison appears to be a specific kind; the phenomena of the fever are very different from those of typhus and typhoid fevers; and patients recovering from these diseases may catch, by contagion, this disease, while patients convalescent from this fever may take typhus or typhoid fever. It has been supposed by some physicians to be allied to yellow fever, but it seems more nearly to resemble some form of Remittent Fever (q. v.), on account of the repetition of the rigors after a regular daily period of from two or three days.

RE'LATIVE KEYS, in Music, the keys most nearly related to any key whose scales have the greater number of their notes in common with it. The keys which are most nearly related to a major key, taken as principal, and into which it may most easily pass, are its *dominant*, or fifth above; its *subdominant*, or fifth below—each of which differs from it by only one sharp or one flat—and its *relative minor* key, that is, the key which has the same signature, is in its descending scale the same, the ascending scale differing by two notes. In the same way, the keys most nearly related to a minor key are its *dominant* and *subdominant*, and its *relative major*. Thus the relative keys of C major, as principal key, are G major, F major, and A minor; and the relative keys of A minor are E minor, D minor, and C major. A more remote degree of relationship subsists between a major key and the dominant and subdominant of its relative minor, or between a minor key and the dominant and subdominant of its relative major. A major key is also closely connected with its tonic minor, or the minor key of the same tonic, as the two keys have the tonic, dominant, and subdominant in common.

RELATIVE PRONOUNS differ from personal and other Pronouns (q. v.) in this, that, besides standing for nouns, they at the same time have the power of conjunctions. They join sentences or clauses by *relating*, or referring back directly, to something just named. The relatives in English are *who*, *which*, and *that*. *What* is used for *that which*, thus embracing both relative and antecedent. In many cases, *who* or *which* can be resolved into a conjunction and a personal pronoun. Ex. 'At last the surgeon was called in, *who* (= *and he*) straightway amputated the limb.' 'Why consult Charles, who (= *for*, or *since he*) knows nothing of the matter?' 'Ahab seized the vineyard of Naboth, *which* (= *although—it*) he had no title to.' In cases where they are not thus resolvable, they introduce sentences or clauses to limit nouns, the relative clause serving the purpose of an adjective. Ex. 'He picked out all the men *who had blue eyes*' (= *the blue-eyed*). 'The house *which stands* (= *situated*) half-way up the hill is the most cheerful.'

Who is employed when the reference is to persons, and *which* when it is to inferior animals or things. *That* is applied to both persons and things; but it does not follow that it may be used at pleasure instead of *who* or *which*. Whenever a *who* or *which* is resolvable as above described, the substitution of *that* would alter the meaning; in the last, e. g., of the three examples given, it would make the sentence declare that Ahab seized the particular one of Naboth's vineyards to which he had not a title; implying that he had a title to some other vineyard or vineyards of Naboth. It is only when the purpose of the relative clause is to limit or define the

thing meant, that *that* is ever applied; and for this purpose, its use is in general preferable to that of *who* or *which*. It is easier and more idiomatic to say: 'All the men that had blue eyes,' than, 'All the men *who*,' &c.; and who would think of saying: 'This is the house *which* Jack built?' Besides, *that* so employed often avoids ambiguities that would attend *who* or *which*. Ex. 'His conduct surprised his English friends, *who* had not known him long.' This may mean either that his English friends generally were surprised, for the reason that they had not known him long; or that only a portion of them—those, namely, that had not known him long—were offended. If the latter is the meaning intended, it would remove all ambiguity to write: 'His English friends *that* had not known him long.'

The use of the demonstrative *that* as a relative is common to the Teutonic languages, but is unknown in Greek, and Latin, and in the Romanic languages. The relatives proper (and the many derivatives and compounds formed from them) in all the allied languages begin with *k*, or an equivalent of *k* (*qv*, *hv*, *hw* = *wh*, *w*, *h*). Sans. *kas*, Gr. *kōs* or *pōs* (how), Lat. *quis*, *qui*, Pol. *kto*, Goth. *hvas*, Ger. *wer*, Dan. *hvi* (pron. *vi*), Eng. *who*, *how*, Fr. *qui*, It. *chi*.

The relatives proper are also used (sometimes with a slight variation of form) to ask questions, when they are called Interrogatives.

RELATIVE RANK, in the Army and Navy, signifies the precedence which certain non-combatant officers and others are entitled to take among their combatant brethren; for instance, in the British army, a commissary-general has the relative rank of major-general, a naval surgeon that of a naval lieutenant, &c. Relative rank carries with it all precedence and advantages attaching to the military rank with which it corresponds, and regulates rates of lodging-money, number of servants, rations of fuel and light (or allowances in their stead), detention, and prize-money. Relative rank does not entitle the holder to salutes from ships or fortresses, nor to the turning out of guards. The relative rank of the several civil departments is stated under their respective headings; see MEDICAL DEPARTMENT, PURVEYORS, &c.

The relative rank of officers in the army and navy of the United States is shown as follows:

Navy.		*Army.**
Admiral	ranks with a	General.
Vice-admiral	"	Lieutenant-general.
Rear-admirals	"	Major-generals.
Commodores	"	Brigadier-generals.
Captains	"	Colonels.
Commanders	"	Lieutenant-colonels.
Lieutenant-commanders	"	Majors.
Lieutenants	"	Captains.
Masters	"	First Lieutenants.
Ensigns	"	Second Lieutenants.
Midshipmen	"	

RELEA'SE, in English Law, is a discharge of some interest in land, or of some legal right. Thus, where one who is the owner of land gives or transfers his right to another, who has some prior estate in possession, the deed by which this is done is a release. Formerly, it was usual for A to give a lease of land to B, and next day to give a release conveying the rest of the estate to B. The term 'release' is also used as a discharge of all demands or rights of action in reference to a particular matter.

RE'LEVANCY, in Scotch Law, means the condition of a plea which is well founded in point of law, provided it be true in fact. An objection to the relevancy corresponds in many respects to a demurrer in English law.

RE'LICS (Gr. *leipsana*, Lat. *reliquiæ*, remains), the name given in theological and historical nomenclature to what may be in general described as the personal memorials of those among the dead who have been distinguished during life by eminent qualities, especially by sanctity or by remarkable religious services. Under the same name are classed certain objects which are believed to be memorials of the life of our Lord upon earth, and especially of his passion and death. Such memorials of the distinguished dead have at all times and in all states of society, however rude, been held in honour among men. But the question as to relics is chiefly important in relation to Christian history, in which the name is restricted to a single class of memorials, viz., to objects which derive their value from their connection with our Lord and with the saints; as, for example, fragments of our Lord's cross or crown of thorns, portions of the dust, the bones, the blood, the instruments of torture, the chains, &c., of the martyrs, the mortal remains, the clothes, the books, and other objects of personal use of the other saints, and even objects to which a certain indirect sacred interest is given by their being brought into contact with the direct memorials of the distinguished dead, as by their being placed on the tombs of the martyrs, touched with the relics, or blessed at the shrine or sanctuary of the saints, &c. In all such cases, the motive of religious honour, however differently it arises, is precisely the same, viz., the association of the object which is honoured with the personage whose virtues or services are the subject of grateful veneration. The merits of relics, in their theological aspect, are beyond the scope of this publication. We shall confine ourselves to an outline of the history of the veneration of relics, and to an explanation of the conflicting views of the rival Christian communions on the subject.

The very earliest monuments of Christian history contain evidences of the deep and reverential affection with which martyrs of the faith, their mortal remains, and everything connected with their martyrdom, were regarded by their fellow-Christians, and for which Catholics profess to find warrant in many passages of the Old and of the New Testament, as Ex. xiii. 19; Deut. xxxiv. 6; 2 Kings xiii. 21, and xxiii. 16—18; Isaiah xi. 10; Matt. ix. 20—22; Acts v. 12—16, and xix. 11, 12. The contemporary letter of the Church of Smyrna attests this plainly as to the martyrdom of Polycarp; Pontian's *Life of Cyprian* tells of their stealing the martyr's body, and carrying it away by night in holy triumph with lights and torches. At an early period, too, miracles are described as connected with relics. Thus Ambrose (Ep. xxii. 1, 2) tells of a blind man's sight restored by his touching the bodies of the martyrs Gervasius and Protasius; and similar wonders are detailed by Gregory Nazianzen (*Orat.* xviii.), Chrysostom (*In S. Ignatium*, n. 5), Leo the Great (*Serm.* iv. 4); insomuch that the possession of relics of the martyrs, and even the occasional touching of them, was regarded as a special happiness (Gregory Naz. *Orat. in S. Theodorum*), and that not merely individuals, but, according to Theodoret the historian, even cities were content to share with each other portions of the sacred treasure (Theodoret, *Græc. Affectionum Curatio*, disp. viii.). Connected with this feeling, too, is found a belief of a certain sacred efficacy in the presence or the touch of the relics, and especially there is ascribed by Chrysostom, Basil, Theodoret, and other Fathers, to prayers offered before the relics, a virtue in dispelling or warding off sickness, diabolical machinations,

* The rank of an army officer, and not the salary he may have received, will control his pay on retirement.

and other evils. Hence we find that altars were erected over the tombs of the martyrs, or at least that relics were invariably placed on the altars, wherever erected, insomuch that the Trullan Council ordered the demolition of all altars in which no relics had been deposited. Far more sacred than the relics of martyrs, was the cross of our Lord, which was believed to have been discovered at Jerusalem by Helena (q. v.), mother of the Emperor Constantine. Minute portions of the wood were distributed to the principal churches; and Cyril of Jerusalem, within less than a century after the discovery of the cross, describes the precious wood as dispersed throughout the world. It must be added, too, that even at this early period, many abuses and superstitions had crept in, which even the Fathers who admit the worship do not fail to condemn.

The practice of relic-worship, however, and the feeling on which it was founded, were not suffered to pass without a protest. Vigilantius, in a treatise which is now lost, but the tenor of which is learned from his adversary, Jerome, reprobated in the strongest terms the excesses to which it was carried, and indeed the essential principles on which the practice rests. But the protest fell without drawing an echo from the contemporary mind. Vigilantius had so few followers, that were it not for the refutation of his work against relics composed by Jerome, we should have no record of his opposition to the popular view; and it is urged by Catholics, as a proof of the universal acquiescence of the church of the 4th c. in the practice of relic-worship, that in an age remarkable for intellectual activity and for polemical ardour—an age which in 25 years saw nearly 30 councils in the cause of the Pelagian heresy—it was not even found necessary to call a single council to condemn Vigilantius.

The writings of Augustine, of Paulinus of Nola, of Ephrem the Syrian, of Gregory the Great, and others, are full of examples of the miraculous virtue ascribed to relics, and of the variety and the extensive multiplication of sacred memorials of all kinds. Nor was this confined to the orthodox alone; all the different parties in the controversy on the Incarnation agreed with Catholics and with one another on this subject, and even the Iconoclasts, at the very time that they most fiercely repudiated the use of images, admitted without difficulty the veneration of relics.

In the age of the Crusades, a fresh impulse was given to the worship of relics in the West, by the novelty and variety of the sacred objects brought home from the churches of Syria, Asia Minor, and Constantinople by crusaders, by palmers returning from Palestine, and by the Latin conquerors of Constantinople; and it is admitted by the most zealous Catholics, that at this period many false, and perhaps even absurd and ridiculous relics were introduced, and were successfully commended to the veneration of individuals or individual churches in the West; nor do they venture to doubt that abuse and superstition found their way side by side with what they regard as the genuine and authorised worship of the church. Nevertheless, with the exception of the Waldenses, Wycliffe, and a few isolated individuals, the practice remained unchallenged till the 16th c., when, in common with many other doctrines and practices of the church of Rome, it was utterly repudiated by the Reformers. Catholics, however, allege that the practice, as sanctioned by the church, has nothing in common with the abuses which form the main ground of the objections alleged by Protestants. The Roman Catholic use of relics, as authorised by the church, is to serve as incentives to faith and piety, by recalling vividly to men's minds the lives, and, as it were, the corporeal presence and the earthly converse of the saints, and thus placing before them, in a more touching manner, the virtues which, in the examples, are held up for men's imitation. The decree of the Council of Trent connects the subject of relic-worship with the general question of saint-worship, and regards the relics of the saints not as possessing intrinsic virtue, but only as instruments 'through which God bestows benefits on men.' See INVOCATION OF SAINTS.

The Greek and other oriental churches, and most of the oriental sects, agree with Roman Catholics in the practice of relic-worship. On the contrary, the Reformed churches, without exception, have rejected the usage as unscriptural, calculated to withdraw from the worship of the one God, and deformed by numerous superstitions. They regard a large proportion of the relics which Roman Catholics worship as false and suppositious, and they specify several, regarding the spuriousness of which even learned Catholics appear to be satisfied. Some relics have been the subject of much controversy among Roman Catholics themselves. See HOLY COAT, HOLY PLACES, LORETTO, PILGRIM. It may be added that the practice of relic-worship forms a notable feature of the Mohammedan usage of pilgrimages. The holy cities of Mecca and Medina, and the celebrated Mosque of Omar at Jerusalem, owe most of their holiness, in Mohammedan eyes, to the memorials of the Prophet, and other relics which they contain; and the celebrated *Sanjak-sherif* or Sacred Standard at Constantinople, is believed to be formed of the nether garment of Mohammed. The practice occupies a still more important place in Buddhism (q. v.—see also CEYLON).

RELIE'F, in English law, means a payment by a tenant or vassal to a lord, the theory being, according to feudal law, that relief (*relevium*, Lat. *relevare*) is a restoration of the lands after the wardship or guardianship of the lord has ceased, and the vassal has attained majority.—Relief is also the common term used among the poor and among parochial officers to denote the pecuniary assistance given under the poor-laws to a pauper. See RELIEVING OFFICER.

RELIEVING OFFICER is a person appointed in an English union or large parish to administer relief, or rather to inquire into the title of destitute persons to be relieved by such union or parish. He is appointed by the Board of Guardians, and his duty is to receive all applications for relief, to inquire into the truth of the facts alleged by the paupers as to their place of settlement, their state of health, ability to work, and the state of their family. In discharging this duty, he requires to visit the house where the pauper lives, to relieve cases of urgent necessity, &c., and to keep a list of all these paupers, and enter what is done with them in his book.

RELIE'VO. See ALTO-RELIEVO.

RELI'GION, in Christian countries, is generally understood as the feeling of reverence towards the Creator and Ruler of the world, together with all those acts of worship and service to which that feeling leads. The root of this sentiment lies in the very constitution of man, and in the circumstances in which he is placed, and manifests itself abundantly even where the one supreme God of the Christian is unknown. Man is naturally religious, and if he is ignorant of the true God, he must make to himself false ones. He is surrounded by dangers and difficulties; he sees the mighty powers of nature at work all around, pregnant to him with hope and fear, and yet inscrutable in their working, and beyond his control. Hence arises the feeling of *dependence* upon something more powerful than himself—the very germ of religion. These operations

of nature, again, he has only one way of conceiving and accounting for. The idea of physical causes is one of late growth; to the primitive man, there is only one kind of agency he can understand—that of a will or mind like his own. Hence all things that he sees moving and acting become to him animated, conscious beings, with thoughts and passions similar to those of men; and what more natural than that he should seek, by offerings and entreaties, to secure their favour, or propitiate their malignity or anger? There is no doubt a vast distance between the reverence with which the Christian looks up to Him that fills the universe, and that of the poor fetich-worshippers (see FETICHISM), but in both cases it is the same feeling that is at the bottom—they are both manifesting religion.*

According to this view, religion includes all forms of belief in the unseen and spiritual powers or gods, together with the practices arising out of those beliefs. The forms that religious belief has assumed are endless, but they may be all classed under two heads: *Monotheism*, or the belief in *one* God; and *Polytheism*, or the belief in *many* gods. The several modes of religious belief and worship are treated in this work each under its own name. See JEWS; CHRISTIANITY; ENGLAND, CHURCH OF; ROMAN CATHOLIC CHURCH; PRESBYTERIANISM; FRIENDS; GREEK RELIGION; MOHAMMEDANISM; INDIA, RELIGION; BUDDHISM; LAMAISM, &c. Subjoined is a statistical table of the divisions of mankind in this respect.

I.—JEWS.

France (including Algeria),	185,000	
Holland and Belgium,	66,000	
Russia and Poland,	2,000,000	
Turkey,	150,000	
Austria,	1,049,871	
Prussia,	252,692	
German States,	476,000	
Great Britain and Ireland,	42,000	
United States,	200,000	
British America,	1,241	
Persia, Egypt, India, China, and Tartary,	2,000,000	
Africa,	1,000,000	
Australia,	2,903	
Total Jews,		7,425,707

II.—CHRISTIANS.

I.—ROMAN CATHOLICS.

America—		
British America,	1,760,000	
United States,	3,000,000	
Mexico and Central America,	9,888,000	
South America,	21,200,000	
Spanish, French, Dutch, Danish, and Swedish Possessions (including Hayti),	2,911,000	
		38,759,000
Europe—		
Portugal,	3,913,000	
Spain,	16,550,813	
France,	35,734,667	
Austria and Venetia,	27,505,375	
Prussia,	6,867,574	
German States (exclusive of Holstein, Lauenburg, Luxemburg, and Limburg),	5,587,473	
Italian Kingdom,	21,350,000	
Switzerland,	1,023,430	
Holland (inclusive of Luxemburg and Limburg),	1,250,000	
Belgium,	4,600,000	
Great Britain and Ireland,	6,000,000	
Denmark Proper (inclusive of Iceland and the Faröe Islands), Slesvig-Holstein, and Lauenburg,	2,000	
Sweden and Norway,	4,000	
Russia, Poland, and Finland,	7,020,000	
Turkey,	640,000	
Greece,	15,000	
Ionian Islands,	40,000	
		138,103,332
Asia—		
Asiatic Russia,	6,000	
East Indies with Ceylon,	1,033,000	
Further India and China,	857,000	
Asiatic Turkey,	260,000	
Asiatic Archipelago,	2,000,000	
Arabia and Persia,	11,000	
		4,167,000
Africa—		
English, French, Portuguese, and Spanish Possessions,	1,041,000	
Egypt, Abyssinia, Tunis, Tripoli, Morocco, and Madagascar,	72,200	
		1,113,200
Polynesia,		280,000
Total Roman Catholics,		182,422,532

II.—GREEK CHURCH.

Austria,	2,918,000	
Prussia,	1,300	
Russia,	59,000,000	
Turkey,	11,625,000	
Greece,	1,080,000	
Total Greek Church,		74,624,300

III.—PROTESTANTS.

Europe—		
Spain and Portugal,	17,000	
France,	1,561,250	
Austria (including Venetia),	3,233,486	
Prussia,	11,287,448	
German States (exclusive of Holstein, Lauenburg, Luxemburg, and Limburg),	11,075,502	
Italy (including the Papal Territory and San Marino, but exclusive of Venetia),	50,000	
Switzerland,	1,482,848	
Holland (inclusive of Luxemburg and Limburg),	2,023,000	
Belgium,	25,000	
Great Britain and Ireland,	23,000,000	
Denmark Proper (inclusive of Iceland and the Faröe Islands, Slesvig-Holstein and Lauenburg),	2,670,000	
Sweden and Norway,	5,463,000	
Russia, Poland, and Finland,	3,940,000	
Turkey,	40,000	
Ionian Islands,	2,000	
		65,870,534
Asia—		
Asiatic Russia,	40,000	
East Indies (with Ceylon and Further India),	300,000	
Arabia, Turkey, Persia, China, and Archipelago,	89,000	
		429,000
Africa—		
English Possessions,	650,000	
Liberia, Algeria, Egypt, and Madagascar,	69,000	
		719,000
Polynesia,		1,000,000
America—		
British America,	2,590,000	
United States,	25,000,000	
South America,	50,000	
Dutch, Danish, and Swedish Possessions (including Hayti)	97,000	
		27,737,000
Total Protestants,		95,755,534

III.—MOHAMMEDANS.

Turkey, Persia, Arabia, Tartary, Madagascar, Africa, India, Archipelago,	120,000,000

IV.—HINDUS.

India,	120,000,000

V.—MAGIAN RELIGION OR PARSEES.

India,	1,000,000

* The word *religion* is of Latin origin, and according to its etymology would mean 'binding,' 'obligation,' or rather 'restraint.' It was applied by the Romans to all actions in which men are guided, not by motives deducible from the ordinary course of nature, but by regard to some unseen power or mysterious influence; as when Livy says of a spot in the forum: *ubi despui religio est*, 'where spitting is a matter of religion;' i. e., where there is a religious scruple restraining people from spitting.

VI.—BUDDHISM AND RELIGIONS OF CHINA AND JAPAN.

Further India and Burmah,	23,000,000	
Tartary,	8,000,000	
Ceylon,	1,600,000	
China,	415,000,000	
Japan,	35,000,000	
		482,600,000

SUMMARY.

The religions of the world may, from the above tables, shortly be summarised in round numbers as follow:

1. Jews,	8,000,000
2. Christians,	353,000,000
3. Mohammedans,	120,000,000
4. Brahminical Hindus,	120,000,000
5. Parsees,	1,000,000
6. Buddhists,	483,000,000
7. To which may be added the Fetichism of the aboriginal tribes of Africa, America, Polynesia, &c.,	189,000,000
Total,	1,274,000,000

—which, according to statistical writers, is the present population of the globe.

PROTESTANTS.

The following table, drawn up from reliable data, shews the numerical strength of the principal churches and sects into which the Protestant part of Christendom is divided:

1. Lutherans,	30,767,924
2. Calvinistic Churches,	12,716,958
3. Anglican Church,	14,459,000
4. Presbyterians,	3,866,000
5. Baptists,	2,439,436
6. Congregationalists,	1,445,683
7. Methodists,	4,406,422
8. Quakers,	203,091
9. Swedenborgians,	12,000
10. Moravians,	157,925
11. Unitarians,	183,000
12. Universalists,	656,000
13. Minor Christian Sects—	
Brethren,	108,422
Campbellites,	710
Christian Chartists,	220
Christian Disciples,	2,471
Evangelical Union,	10,319
Free Christian Brethren,	340
Irvingites,	6,000
Mormons,	100,902
Sandemanians,	1,700

RELIGION, Offences Against. See Brawling in Churches. In Scotland, the crime of blasphemy is sometimes described as the crime of treason or lese-majesty against God, which consists in denying His being and attributes, and uttering impious and profane things against God, or the authority of the Holy Scriptures. The crime was more rigorously punished by the old statutes of Scotland than by those of England; but the statute 6 Geo. IV. c. 47 declared it expedient that the punishment should be the same, and enacted accordingly. Profanity is in Scotland treated as an offence lower in degree than blasphemy, and includes profane swearing, which is punishable with a fine by justices of the peace; scoffing at religion, or the public mocking or contempt of religion, which is punishable in the same manner, and the disturbance of public worship. The first statute providing against disturbances of public worship was dated 1551, which inflicted a fine; but a later statute of 1587, added escheat of movables as part of the punishment, and applied the penalty to all cases of raising a fray or disturbance in the kirk-yard equally as in the kirk, to the troubling or dispersing of the people assembled there for religious purposes.

RELIGIOUS TRACT SOCIETY, a Society for the promotion of religion by the publication and circulation of religious tracts and small books. By far the most important Religious Tract Society in the world is that of London, which was founded in 1799. There are now, indeed, numerous Religious Tract Societies in different parts of the world, comparatively limited in their field of operations; this great Society reckoning many of them as its branches and auxiliaries. The advantage likely to accrue to the cause of religious truth by the diffusion of tracts and pamphlets, was thoroughly appreciated at the time of the Reformation, but no society was formed for the purpose. In the 17th c., several traces are found of associations for printing and promoting the sale of religious works, but none of them seems to have existed long, or to have been intended for permanence. The English 'Society for Promoting Christian Knowledge,' founded in 1701, avowed, for one of its objects, 'to disperse, both at home and abroad, Bibles and tracts of religion.' In 1750, a society was formed in England, called 'The Society for Promoting Religious Knowledge among the Poor,' not, like the former, confined to the Church of England, but embracing Christians of all denominations, which published many tracts and books; and shortly after, similar societies were founded in Edinburgh and Glasgow, which, however, were of brief existence. The design of the Religious Tract Society originated with Mr Burder, a minister at Coventry, and amongst its founders were Rowland Hill, Matthew Wilks, and other ministers eminent in their day. It was founded on occasion of the annual meeting of the London Missionary Society. Its beginnings were humble, but it soon expanded, until its income, from contributions of benevolence, has for many years been always above £4000, sometimes nearly twice that sum. It derives also a large income from the sale of its publications. Its operations have extended over all quarters of the world, and it has issued books and tracts in more than 100 different languages and dialects, thus rendering very efficient assistance to missionary and other evangelistic operations. Many of the publications of the Society, except during the first years of its existence, have been books rather than tracts. It has produced many new works, and also many reprints and abridgments.

Objections are sometimes strongly urged against its mode of operations, as interfering with the natural course of the book-trade, and checking free commercial enterprise; to which it has been always replied, that the diffusion of good and cheap books has increased the demand for them, and that the influence of the Society has been favourable and not unfavourable to the book-trade in general. It is impossible, however, to accept this as any proper answer to the objections in question. Fair competition in trade is a sacred principle not lightly to be interfered with, and it is sufficient to say that certain members of the general publishing business complain of being encountered by a system of production which leaves them no hope of competing successfully with the Society. That tracts distinctly religious may be rendered a valuable engine of spiritual and social advancement is not to be disputed; and those impressed with this conviction cannot but regret that among the immense mass of tracts issued in Great Britain and the United States, so many, owing to the exaggerated and false views they present, not only of the facts of life but of the teaching of Scripture, are calculated to damage rather than promote the cause they are meant to serve.

RELIQUARY, a case or box to contain relics. They are made of all kinds of materials, such as wood, iron, stone, ivory, silver, &c., and are frequently ornamented with costly jewels. Shrines

are of the same description. That of the 'Three Kings,' at Cologne, has jewels valued at £240,000.

RELI'QUIÆ (Lat. remains), applied in Geology to the remains of plants and animals found fossil in the sedimentary deposits.

REMAI'NDER is a term much used in the law of England. Thus, if the owner of the fee-simple, or freehold of lands, give them by will or deed to A for life, and after his decease to B and his heirs, the interest of B is called the remainder, because, after deducting A's life estate, all that remains belongs to B. A remainder is distinguished from a reversion in this, that in the latter case, the remainder returns to the owner of the estate himself, and so it is called, in that instance, a reversion instead of a remainder. A contingent remainder is too technical a term to be popularly explained, though it plays an important part in the law of real property in England. It is an estate which may or may not ever become vested or enjoyable.

REMBA'NG, a town and seaport of Java, capital of a residency of the same name, stands on the north coast of the island, in long. about 111° 10′ E. It contains 11,000 inhabitants, and is the seat of some trade. The residency, of which the area is 2600 sq. m., the pop. 460,000, contains forests which are the peculiar haunts of the black tiger, an animal found nowhere out of the island.

REMBRANDT HERMANSZOON, commonly called REMBRANDT VAN RHYN, was the son of a miller, Herman Gerritsz van Rhyn, whose house (where the painter was born) and mill were situated on an arm of the Rhine at Leyden. R. was born either on 15th July 1606, or in 1608. The former date rests on the authority of the *Description of Leyden*, published in 1641, by Orlers, burgomaster of that town, under whose custody, along with other registers of the city, were those of the registers of baptism, since lost. The latter date rests on the painter's marriage-certificate, lately discovered, dated 10th June 1634, in which R. is stated to be aged 26, and thus the year of his birth 1608. He attended for a short time the Latin School at Leyden; and after studying art three years under Jacob van Swanenburg, and for a very limited period under Pieter Lastman at Amsterdam, and Jacob Pinas at Haarlem, he returned home, and devoted himself to the study of nature. His works now attracted some attention; and about the year 1630, he was encouraged to establish himself at Amsterdam, where he soon entered on a most successful career, and executed numerous works—portraits, landscapes, historical and *genre* subjects, and those wondrous etchings, numbering above 360, which have served almost as much as his paintings to raise his reputation so high. R. holds the chief place in the Dutch School; his power and originality are exemplified in almost every branch of art; and as examples of composition, expression, colour, and light and shade, his works rank with those of the greatest artists. He had numerous pupils, many of whom, such as Gerard Dow, G. Flinck, F. Bol, N. Maas, P. de Koning, and Vanden Eeckhout, were distinguished artists. R. spent his large gains in the indulgence of a taste for works of art, arms, and objects of *vertù*, as is proved by an inventory of his effects, extracted from the registers of the Insolvents' Court at Amsterdam, for he got into difficulties, partly from his expensive habits, and partly on account of claims by the tutors of his son, after the death of his first wife. He married a second time, and left two children; his son Titus, by his first wife, predeceased him. Many interesting matters connected with the history of this great painter have been brought to light and published so lately as 1853, by Dr P. Scheltema, Keeper of Records at Amsterdam. The date of the painter's decease was a matter of doubt; but among other documents discovered by this author, the following extract, from the Register of Burials of the city of Amsterdam, proves that he was interred in the Westerkerk (West Church) on 8th October 1669: 'Deynsdach, 8th October 1669, Rembrant van Rijn, Schilder, op de Rosegraacht, teghenover het Doolhof. Laet na 2 Kynders.'—('This day, 8th October 1669 [was buried] Rembrandt van Rhyn, Painter, on the Rosegraacht [Rose-Canal], opposite the Labyrinth. He leaves two children.')

REMIREMONT, a small town of Lorraine, in the former French department of Vosges, stands on the left bank of the Moselle, 17 miles south-east of Epinal. Here, two abbeys, founded in 620, were destroyed in the 10th c., but afterwards rebuilt. Of these, the more important was for lady canonesses. Its abbess was a princess of the empire, and those over whom she presided were all descended from families which had been noble for at least four generations. The remains of the abbey are the finest buildings in the town. Linen and muslin goods are extensively manufactured; and paper, leather, and wrought-iron are made. R. is the great mart for the neighbouring mountain districts. Pop. 5668.

REMI'SSIO INJU'RIÆ, in Scotch Law, denotes a forgiveness of an injury, and it is set up in answer to an action of divorce for adultery. Forgiveness implies that the party knew of the injury, and acted as if it had never happened; and it is proved by words or acts, such as cohabitation. In English law, it is called condonation. In Scotch law, remission is an extinguishment of a crime by pardon or by act of parliament, but it does not prevent a private party recovering damages.

REMI'TTENT FEVER is one of the three varieties of fever arising from malaria or marsh-poison—the two others being Intermittent Fever, or Ague (q. v.), and Yellow Fever. In its milder forms, it scarcely differs from severe intermittent fever; while in its more serious form, it may approximate closely to yellow fever. As the nature of the poison on which it depends is sufficiently noticed in the article MIASMA, we shall at once proceed to describe the most characteristic symptoms. The attack may be either sudden or preceded by languor, chilliness, and a general feeling of *malaria*. Then comes a cold stage, similar to that occurring in ague, and usually of short duration. This is followed by a hot stage, in which the symptoms are commonly far more intense than those exhibited in the worst forms of ague. Giddiness proceeding to delirium is not uncommon, and is a bad symptom; while, in other cases, drowsiness or lethargy is one of the most marked symptoms. There is often great tenderness or pain in the region of the stomach, and vomiting—the vomited matter frequently containing bile or blood. A remission of these symptoms occurs, in mild cases, in six or seven hours; but, in severe cases, the paroxysm may continue for 24 hours or longer. The remission is sometimes, but not always, accompanied with sweating. The duration of the remission is as varied as that of the paroxysm, varying from two or three to thirty hours, or even longer. The fever then returns with increased severity, and without any cold stage; and then the paroxysms and remissions proceed, most commonly according to no recognisable law, till the case terminates either fatally or in convalescence. In favourable cases, convalescence is usually established in about a week. The severer forms of this

fever are often accompanied with more or less jaundice, and hence the disease has received the name of bilious remittent fever. It is also known as jungle fever, lake fever (from its prevalence on the border of the great American lakes); and the African, Bengal, Levant, Walcheren, and other similar local fevers, are merely synonyms of the disease. In England, the disease is very rare; and when it occurs, it is usually mild. The disease is most severe in Southern Asia, Western Africa, Central America, and the West India Islands.

The first object of treatment is to reduce the circulation during the hot stage. This is done by bleeding, followed by a dose of five grains each of calomel and James's powder, and, after an interval of three or four hours, by a sharp cathartic—as, for instance, the ordinary black draught. On the morning of the following day, the remission will probably be more complete, when quinine, either alone or in combination with the purgative mixture, should be freely and repeatedly administered. A mixture of antimonial wine with acetate of potash should also be given every two or three hours, so as to soften the skin, and increase the action of the kidneys. Sir Ranald Martin—our highest authority in relation to tropical diseases—has directed attention to the fact, that the patient must be carefully watched during the period of convalescence. A timely removal from all malarious influence, by a change of climate or a sea-voyage, is of the highest importance, and is more likely than any other means to prevent fatal relapses into other forms of fever, or into dysentery, which so frequently occur to our troops at stations where miasmatic influences are rife. Although the above sketch of treatment is applicable in most cases, there are some forms of this fever in which blood-letting cannot be borne; and almost every epidemic fever of this kind requires special modifications of treatment. The following data, extracted from a table drawn up by Sir Alexander Tulloch, will give some idea of the frequency of this disease and the variations in intensity:

	Period of Observation.	Aggregate Strength.	Number Attacked.	Died.	Ratio of Deaths to Cases Attacked.
Jamaica, .	20 years,	51,567	38 393	5114	1 to 8
Gibraltar, .	19 "	60,269	1,522	423	1 " $3\frac{2}{3}$

REMO'NSTRANTS. See ARMINIUS.

RE'MORA, or SUCKING-FISH (*Echeneis*), a genus of fishes which Cuvier placed among the *Discoboli* (q. v.), but which constitutes an entire family, *Echeneidæ*, near the *Scombridæ*, among *Acanthopteri*. Their chief relation to the *Discoboli*, indeed, is in the possession of a sucker, by which to affix themselves to objects of various kinds; but the sucker itself is very different. The remoras have an elongated body, covered with very small scales; one soft-rayed dorsal fin, situated above the anal fin; the head flattened, and covered with an elongated disc extending back beyond it, which is the sucker; the mouth large, with numerous small recurved teeth on both jaws, the vomer, and the tongue. The sucker-disc exhibits numerous transverse cartilaginous laminæ directed backwards, and has a free flexible broad margin. These laminæ are formed by modification of the spinous processes of a first dorsal fin. They are moved simultaneously by sets of muscles raising or depressing them, and when they are raised after the margin of the disc has been closely applied to a smooth surface, a vacuum is created; and so powerful is this apparatus, that great weights may be dragged by a R.; whilst it obstinately refuses to let go its hold, and will even submit to be torn in pieces before it does so. The Common R. of the Mediterranean, and of the ancients, is a small fish, seldom more than eight inches long, of a dusky-brown colour. It is found in the Atlantic, and occasionally as far north as the British coast. It is frequently seen among the other fishes following ships, and often attaches itself by its sucker to some other fish, even of a kind that would make haste to devour it if it could be reached—an instance of which once occurred on the British coast, a R. being taken affixed to a cod—often also to the rudder or bottom of a ship. The ancients imagined that it had power to impede or arrest the course of a ship, a fable which continued to be credited till recent times. Thus, it was alleged, was Antony's ship detained from getting soon enough into action in the memorable and decisive battle of Actium. Of what use its power of adhesion is to the R., is matter of mere conjecture. The R. is very palatable. There are about ten known species, some of the tropical ones much larger than the Common Remora. One of them is said, on the authority of Commerson, to be used on the coasts of Mozambique for the curious purpose of catching turtles. A ring is fixed round its tail, with a long cord, and the fish, placed in a vessel of sea-water, is carried out in a boat; the fishermen row gently towards a sleeping turtle, and throw the R. towards it, which seldom fails immediately to affix itself, when the cord is drawn in, and the turtle becomes an easy prey.

REMOULADE, a term in Cookery for a fine kind of salad-dressing, consisting of the yolks of two eggs, boiled hard; flour of mustard, about a teaspoonful, rubbed up with three or four tablespoonfuls of oil; when they are thoroughly incorporated, add two tablespoonfuls of vinegar and a little pepper, and other flavouring materials according to taste. It is much used in making the salad called Mayonnaise.

REMO'VAL OF GOODS by a tenant of a house to prevent the landlord distraining or seizing them in payment of rent, is attended with this consequence: if the rent is already due, and not merely current rent, then, if a tenant fraudulently or clandestinely remove the goods from the premises, the landlord may, within 30 days thereafter, take and seize these goods wherever they are found, and sell them, by way of payment of his rent. If the tenant remove the goods the day before the rent becomes due, the landlord cannot so follow the goods. Whoever assists the tenant to remove his goods fraudulently, forfeits to the landlord double the value of the goods removed.

REMOVAL OF PAUPERS, in the law of England, is the technical term applied to the compulsory removal of paupers from a parish in which they have become destitute, to the parish of their settlement, and which, therefore, is bound to maintain them. The right of parochial officers to remove paupers in such circumstances has long been considered as one of doubtful wisdom, and the propriety of continuing it has latterly been much discussed. As the law stands, wherever a person becomes destitute in a parish in which he was not born, or in which he has not acquired a Settlement (q. v.), as it is called, the overseers may apply to a justice of the peace at once to remove him to his own parish. In such a case, notice must be given by the removing parish to the parish of settlement, so that the latter may oppose the proceeding;

and this gives rise to frequent litigation, for the point turns on the antecedent history of the pauper, or it may be of the pauper's father or grandfather. The right of removing paupers is as old as 13 Charles II. At first, it was in the power of the overseers, whenever a poor person came into the parish who was likely to become chargeable, to apply for a warrant to remove him after forty days. But this was thought too great a restriction on the natural liberty of poor persons to go where they like in the hope of bettering themselves, and the power of removal was restricted to cases where they have already become actually destitute, and apply for relief. Even that limitation was thought to be too oppressive on the poor man; and by a statute of 1846, whenever a poor man had lived in any parish, where he had no settlement previously, for five years, it was not allowed to remove him thereafter at all, but the expense of his maintenance fell upon the common fund of the union. By a later statute of 1862, this period was reduced to three years, and he is now irremovable not only if he has lived three years in a parish not his own, but in any one union; so that now the removability of paupers is greatly checked, and made less oppressive.

REMOVING OF TENANTS, in Scotch Law, is the giving up of possession by a tenant after the expiry of his lease or term. There must have been a previous notice to quit, or warning, before a tenant can be compelled to remove, and this notice is forty days before Whitsunday; i.e., before 15th May. If there is no express stipulation in the lease binding the tenant to remove at the end of the lease, then the landlord must give warning, which he does by summons of removing in the Sheriff Court; and if the tenant do not punctually remove, decree of removal may be obtained. If there is a stipulation to remove, then that is equivalent to a decree of removing, and a sheriff-officer, with a written authority from the landlord, can remove the tenant by force. In England, no notice to quit is necessary on either side if the lease was for a definite term; but if it was indefinite, then it is treated as a lease from year to year, and half a year's notice to quit must be given by the landlord. If, however, the tenant wrongfully refuse to quit, there is in most cases no summary mode of ejecting him, and an action of ejectment is necessary.

RE'MSCHEID, a manufacturing town of Prussia, occupies a height of 1110 feet above sea-level, in the government of Düsseldorf, and 18 miles east-south-east of the city of that name. Originally a villa, it was in possession of a church as early as 1189. It contained several iron-foundries in 1580, in which pig-iron was worked into bars by hand. Its iron trade and manufactures were advanced by the immigration of numbers of artisan Refugees (q. v.). It carries on extensive manufactures of iron wares, cutlery, &c., which are exported to all parts of the world. Pop. (1867) 19,956.

REMUSAT, Charles, Comte de, a French philosopher and politician, son of Auguste Laurent, Comte de Remusat, a Provençal gentleman of some note, who held various public offices during the first Empire and after the Restoration, was born at Paris, 14th March 1797, and studied with brilliant success at the Lycée Napoléon. He made his political *début* in 1818 as a Doctrinaire journalist, allying himself closely with Guizot, who, he confessed, had exercised a greater influence on the formation of his opinions than any other; but he subsequently withdrew from this connection, and became more independently liberal, though he always remained temperate and prudent in his views. Among his earlier political essays, the most important are *Sur la Responsabilité des Ministères; Sur la Liberté de la Presse; Sur la Procédure par Jurés en Matière Criminelle* (1820); and *Sur les Amendements à la Loi des Elections* (1820). On the establishment of the *Globe* in 1824, R. became one of its most indefatigable contributors, and his name appears in the list of journalists who signed the protest against the fatal 'ordonnances' of the minister Polignac, which brought about the July revolution. After 1830, R. entered the French chambers as deputy of Muret in the Haute-Garonne, representing it till 1848. He supported the ministry of Casimir Périer, was for a brief period Under-secretary of State (1836) in that of Comte Molé; and in 1840, when the government passed into the hands of Thiers, R. was made Minister of the Interior, but soon resigned the office. After the flight of Louis Philippe, he continued a member of the Constituent and Legislative Assemblies, and was a warm supporter of the party of order. He was exiled (like so many other of the best men in France) after the *coup d'état* of Louis Napoleon, but subsequently received permission to return to France, and has since devoted himself to the serener pursuits of literature and philosophy. For more than 20 years, he has been a contributor to the *Revue des Deux Mondes*, where his clear, logical, and vivid style is well known. Among his philosophical efforts are his *Essai sur la Nature du Pouvoir; Essais de Philosophie* (Paris, 2 vols. 1842); *Abelard* (2 vols. 1845); *Passé et Présent, Mélanges* (2 vols. 1847); *Saint Anselme de Cantorbéry* (1852); *Bacon, sa Vie, son Temps* (1858).

REMUSAT, Jean Pierre Abel, a distinguished Chinese scholar, was born at Paris, 5th September 1788, studied medicine, and took his diploma in 1813; but as early as 1811, had published an *Essai sur la Langue et la Littérature Chinoises*, the fruit of five years' arduous work. In 1813, the conscription seized him, but, instead of being compelled to serve as a common soldier, he was appointed assistant-surgeon in the Paris military hospitals, and was subsequently intrusted with the charge of fever-patients at the hospital Montaigu. In the midst of his arduous and harassing professional duties, he found time to prepare for the press his *Uranographie Mongole*, and *Dissertation sur la Nature Monosyllabique attribuée communément à la Langue Chinoise*. At last, however, the day came when he was at liberty to devote himself entirely to Sinological studies. The Abbé Montesquiou, Minister of the Interior during the first Restoration of the Bourbons, instituted a chair of Chinese at the Collége de France, and R. was named professor, 9th November, 1814. He delivered a splendid inaugural address in January, 1815, an analysis of which appeared in the *Moniteur* of 1st February, executed by Silvestre de Sacy himself. Of the numerous works that he wrote subsequent to this period, we may mention *Recherches sur les Langues Tartares* (1820), a work in some sort preparatory to his *Eléments de la Grammaire Chinoise* (1822), the grandest monument of the vast Sinological erudition and labour of Remusat. Another of his important philological productions was his *Recherches sur l'Origine et la Formation de l'Ecriture Chinoise* (1827). 'Although acquainted,' says M. Walckenaer, 'with several of the most difficult languages of Asia, and with almost all the ancient and modern languages of Europe, he regarded such knowledge as only a means to an end . . . . In a crowd of treatises, dissertations, critical analyses, and translations, either published as separate works or inserted in *Mémoires*, he has endeavoured to embrace everything relating to the nations whom he

proposed to make known. Religious beliefs, philosophical systems, natural history, geography, political revolutions, the origins of races, biography, literature, manners, habits, and customs—he has treated all in an equally masterly style.' Among the works of R. which illustrate this *éloge* of M. Walckenaer are his *Etude Historique sur la Médecine des Chinois; Tableau Complet des Connaissances des Chinois en Histoire Naturelle* (unfinished); *Sur la Pierre Iu* (a curiously learned disquisition on a crowd of historical questions and religious rites); *Notice sur la Chine et ses Habitants* (in which the author treats of the extent, administration, manners, commerce, &c., of China); *Sur l'Extension de l'Empire Chinois en Occident depuis le Premier Siècle avant Jésus-Christ jusqu'à nos Jours*, a work that has thrown much light on the interesting question: Who were the barbarians that overthrew the Roman empire? R., in particular, paid great attention to the religions of China, except, strange to say, that of Confucius. He was the first to make known in Europe the life and opinions of the philosopher Laou-Tsze, head of the religious sect *Taou-tsé*, and wrote numerous works, more or less valuable, on the history of Buddhism. A list of his various works is given in the article 'Remusat,' in the *Nouvelle Biographie Générale*, to which we are chiefly indebted for our information. In 1818, R. became one of the editors of the *Journal des Savants;* in 1822 he founded the *Société Asiatique* of Paris, of which he was perpetual secretary; in the following year, he was chosen a member of the Asiatic Societies of London and of Calcutta; and in 1824, he was appointed curator of the Oriental Department in the Bibliothèque Royale. He died of cholera at Paris, 4th June 1832, at the early age of 44.

REMY, or REMI, St (Lat. *Remigius*), a saint of the Roman Catholic Church, was born of a noble family of Laon, in Picardy, in the year 438 or 439. He was appointed, against his will, at the early age of 22, to the bishopric of Rheims, and his episcopate is memorable for the conversion of Clovis, who was baptised by Remy. It was on occasion of this ceremony that, contrasting our Lord and his cross with the idols whom Clovis had hitherto adored, R. used the words which afterwards became almost epigrammatic: 'Adore henceforward what thou hast hitherto burned, and burn that which thou hast adored.' R. lived to see Gaul almost entirely Christianised, and died in his 93d or 94th year in 533. Some of his letters are preserved in the *Bibliotheca Patrum*, as also two documents under the title of *Testamenta*, the genuineness of which has been the subject of a curious controversy.

RENAI'SSANCE, the name given to the style of art, especially architecture, in Europe, which succeeded the Gothic, and preceded the rigid copyism of the classic revival in the first half of the present century. Under the heading Italian Architecture we have traced the rise and progress of the Renaissance in the country of its birth. The spread of classical literature during the 15th and 16th centuries created a taste for classic architecture in every country in Europe. France, from her proximity and constant intercourse with Italy, was the first to introduce the new style north of the Alps. Francis I. invited Italian artists to his court during the first half of the 16th century. The most distinguished of these were Leonardo da Vinci, Benvenuto Cellini, Primaticcio, and Serlio. These artists introduced Italian details, and native architects applied them to the old forms to which they were accustomed, and which suited the purposes of their buildings, and thus originated a style similar to, though diverse from, that of Italy.

The Italian buildings were chiefly churches, St Peter's being the great model. In France (as in the other countries north of the Alps), the stock of churches was more than was required. The grand domestic buildings of Florence and Rome were actually needed for defence, and were founded in design on the old medieval castles, which the nobles occupied within the cities. The domestic architecture of France is rather taken from the luxurious residences of the monks, and although very graceful in outline and in detail, its buildings want the force and grandeur of the Italian palaces.

In the French Renaissance, so much are the old Gothic forms and outline preserved, that the buildings of Francis I. might, at a short distance, be mistaken for Gothic designs, although, on nearer approach, all the details are found to be imitated from the classic. Such are the palaces of Chambord

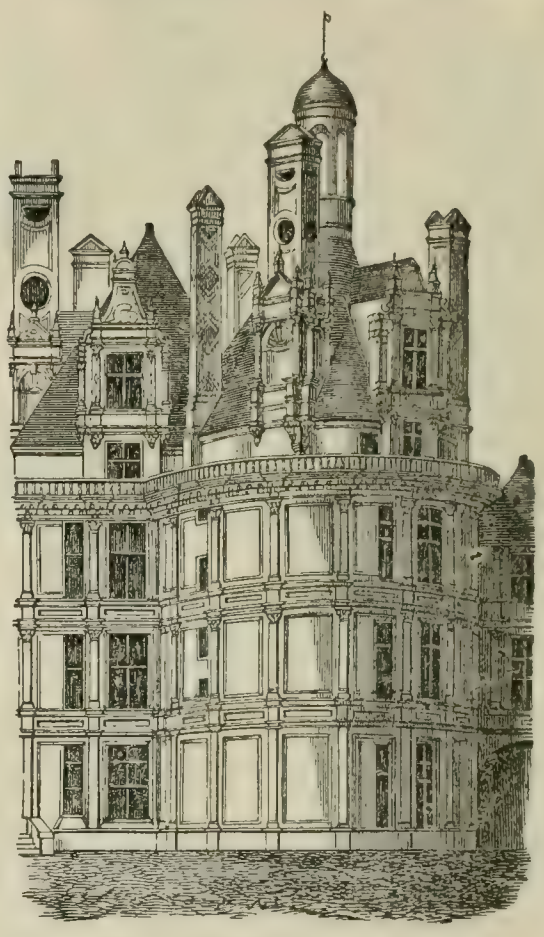

Fig. 1.—Château of Chambord.

and Chenonceaux on the Loire, Fontainebleau, and many others. The churches of this period are the same in their principles of design. Gothic forms and construction are everywhere preserved, while the detail is as near classic as the designers could make it. St Eustache, in Paris, is one of the finest examples of this transitional style.

From the middle of the 16th to the middle of the 17th c., a style prevailed which may be said to have combined all the defects of the Renaissance. It was neither classic nor Gothic. It had no principles of construction or decoration save the individual caprice of the designer. This style, usually known as that of the time of Henry IV., is the basest which has been adopted in France, and has no redeeming qualities. It may be distinguished by the constant use of meaningless pilasters, broken entablatures, curved, and contorted cornices, architraves, &c., all applied so as to conceal rather than to mark and

dignify the real uses of the features of the buildings. The palace of the Tuileries shews well all the above defects. From this debased and meaningless

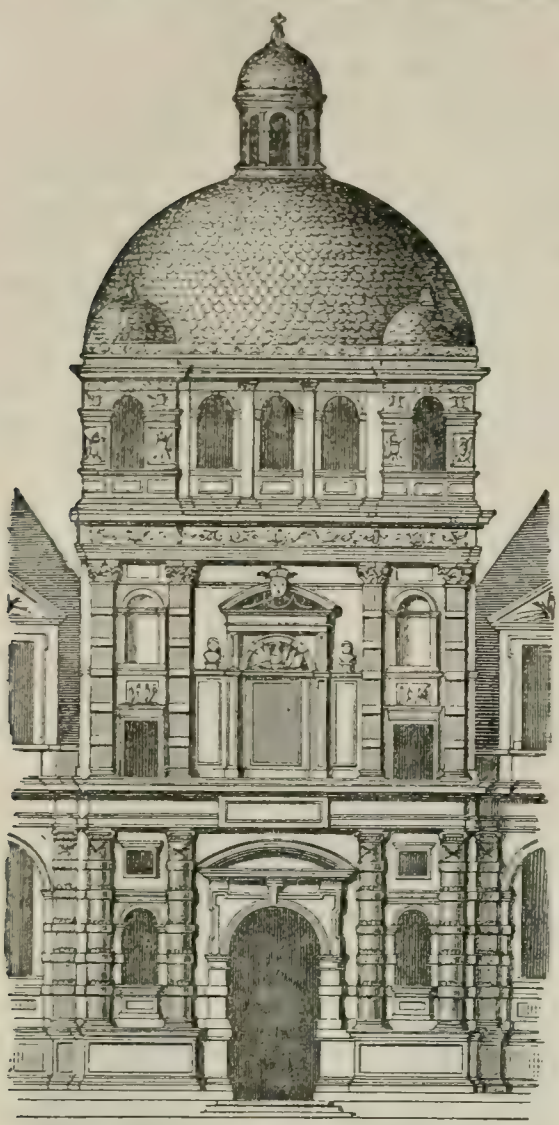

Fig. 2.—Central Pavilion of the Tuileries,
As designed by De Lorme (from Mariette).

style, architecture gradually recovered, and during the 18th c., a style more becoming the dignity and importance of the *Grand Monarque* was introduced. The classic element now began to prevail, to the entire exclusion of all trace of the old Gothic forms. Many very large palaces are built in this style; but, although grand from their size, and striking from their richness and luxuriance, they are frequently tame and uninteresting as works of art. The palace of Versailles (q. v.) is the most prominent example. The two Mansards, one of whom designed Versailles, had great opportunities during this extravagant epoch. Their invention of giving a row of separate houses the appearance of one palace, which has ever since saved architects a world of trouble, was one of the most fatal blows which true street-architecture could have received. The east front of the Louvre, designed by Perrault, is one of the best examples of the style of the age. Many elegant private hôtels and houses in Paris were erected at this period. The most striking peculiarity of the style of Louis XIV. is the ornament then used, called Rococo (q. v.).

The classic Renaissance was completed in the beginning of the present century by the literal copyism of ancient buildings. Hitherto, architects had attempted to apply classic architecture to the requirements of modern times; now they tried to make modern wants conform to ancient architecture. In the Madeleine, for instance, a pure peripteral temple is taken as the object to be reproduced, and the architect has then to see how he can arrange a Christian church inside it! Many buildings erected during the time of the Empire are no doubt very impressive, with noble porticoes and broad blank walls; but they are in many respects mere shams; attempts to make the religious buildings of the Greeks and Romans serve for the conveniences and requirements of the 19th century. This has been found an impossibility—people have rebelled against houses where the window-light had to be sacrificed to the reproduction of an ancient portico, and in which the height of the stories, the arrangement of the doors, windows, and, in fact, all the features were cramped, and many destroyed. The result has been that this cold and servile copyism is now entirely abandoned, and the French are working out a free kind of Renaissance of their own, which promises well for the future; and is, at the present moment, as the streets of Paris testify, the liveliest and most appropriate style in use for modern street-architecture.

In Spain, the Renaissance style took early root, and from the richness of that country at the time, many fine buildings were erected; but it soon yielded to the cold and heavy 'Greco-Romano' style, and that was followed by extravagances of style and ornament more absurd than any of the reign of Louis XIV. The later Renaissance of Spain was much influenced by the remnants of Saracenic art which everywhere abound in that country.

In England, as in the other countries of Europe, classic art accompanied the classic literature of the period; but, being at a distance from the fountain-head, it was long before the native Gothic style gave place to the classic Renaissance. It was more than a century after the foundation of St Peter's that Henry VIII. brought over two foreign artists —John of Padua and Havenius of Cleves—to introduce the new style. Of their works, we have many early examples at Cambridge and Oxford, in the latter half of the 16th century.

Longleat, Holmby, Wallaton, and many other county mansions, built towards the end of the 16th c., are fine examples of how the new style was gradually introduced.

The course of the Renaissance in England was similar to its progress in France; it was even slower. Little classical feeling prevailed till about 1620. The general expression of all the buildings before that date is almost entirely Gothic, although an attempt is made to introduce classical details. The pointed gables, mullioned windows, oriels and dormers, and the picturesque outlines of the old style, are all retained long after the introduction of quasi-classic profiles to the mouldings. This style, which prevailed during the latter half of the 16th c., is called Elizabethan, and corresponds to the somewhat earlier style in France of the time of Francis I. This was followed in the reign of James I. by a similar but more extravagant style called Jacobean, of which Heriot's Hospital is a good example; the fantastic ornaments, broken entablatures, &c., over the windows, being characteristic of this style, as they were of that of Henry IV. in France.

The first architect who introduced real Italian feeling into the Renaissance of England was Inigo Jones. After studying abroad, he was appointed superintendent of royal buildings under James I., for whom he designed a magnificent palace at Whitehall. Of this, only one small portion was executed (1619—1621), and still exists under the name of the Banqueting House, and is a good example of the Italian style. Jones also erected several elegant

mansions in this style, which then became more generally adopted.

In the latter half of the 17th c., a splendid opportunity occurred for the adoption of the Renaissance style after the great fire of London. Sir Christopher Wren rebuilt an immense number of churches in that style, of which St Paul's (q. v.) was the most important. The spire of Bow Church and the interior of St Stephen's, Wallbrook, are also much admired.

During the 18th c., classic feeling predominated, and gradually extended to all classes of buildings. In the early part of the century, Vanbrugh built the grand but ponderous palaces of Blenheim and

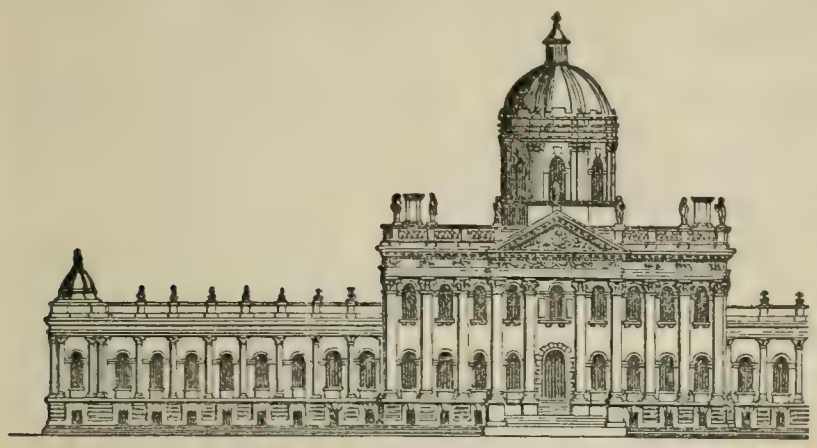

Fig. 3.—Park Front of Castle Howard.

Castle Howard, which have a character and originality of their own. To these succeeded a vast number of noblemen's mansions, designed by Campbell, Kent, the Adamses, and others.

Many of these, like the contemporaneous buildings of France, are of great size and magnificence; but they are usually tame and cold in design, and a sameness pervades them all. They generally consist of a rustic basement-story, with a portico over the centre, and an equal number of windows on either side. The portico is considered essential, and although perfectly useless, the light and convenience of the house are invariably sacrificed for it.

The further study of the buildings of Greece and

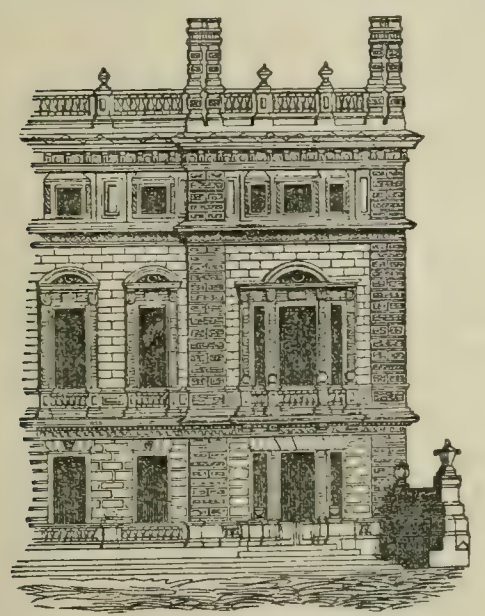

Fig. 4.—Part of Park Front of Bridgewater House.

Rome led, in the beginning of the present century, to the fashion of reproducing them more literally. All important public buildings were now required to be absolute copies of ancient buildings, or parts of them, or to look like such, and then the architect had to work out the accommodation as best he might. St Pancras' Church in London is a good example. It is made up of portions from nearly every temple in Greece! Many really successful buildings, such as St George's Hall, Liverpool, the High School and Royal Institution in Edinburgh, have been erected in this style; but they owe their effect not to their being designs well adapted to their requirements, but to the fact, that they are copies from the finest buildings of antiquity.

Sir Charles Barry was the first to break away from this thraldom, and to return to the true system of designing buildings—those, namely, which have their general features arranged so as not only to express the purposes they are intended to serve, but in so doing to form the decorative as well as the useful features of the buildings. The Travellers' Club-house and Bridgewater House in London are admirable specimens of his design. There are no superfluous porticoes or obstructive pediments, but a pleasing and reasonable design is produced by simply grouping the windows, and crowning the building with an appropriate cornice.

As already noticed, a similar style of domestic architecture is now being worked out in France; but both there and in this country there has been a reaction against everything classic, and a revival of medieval architecture has superseded that of classic, especially in ecclesiastical buildings. A very large number of churches has been erected within the last 30 years in the Gothic style, but it cannot be said that these are usually well adapted to the modern Protestant service. The most magnificent example of this style is the Palace or Houses of Parliament at Westminster.

In Germany, Russia, and every country of Europe, the Renaissance prevailed in a manner similar to that above described. In Germany, there are few specimens of early Renaissance, the picturesque castle of Heidelberg being almost unique as an early example. The Zwirner and Japanese palaces at Dresden, which are nearly alone as edifices of the beginning of the 18th c., shew how poor the architecture of Germany then was. In the domestic buildings of Nuremberg, Dresden, and other towns of the north of Germany, there are many instances of the picturesque application of classic detail to the old Gothic outlines.

One of the most striking examples of the revival of classic art occurred in Bavaria during the first half of the present century, under the auspices of King Louis. He caused all the buildings he had seen and admired in his travels to be reproduced in Bavaria. Thus, the royal palace is the Pitti Palace of Florence on a small scale; St Mark's at Venice is imitated in the Byzantine Chapel-royal; and the Walhalla, on the banks of the Danube, is an exact copy (externally) of the Parthenon. The finest buildings of Munich are the Picture-gallery and Sculpture-gallery by Klenze, both well adapted to their purpose, and good adaptations of Italian and Grecian architecture.

In Vienna and Berlin, there are many examples of the revived Classic and Gothic styles, but the Germans have always understood the former better than the latter. The museums at Berlin, and many of the theatres of Germany, are good examples of

classic buildings.—The domestic architecture of Berlin is well worthy of notice, many of the dwelling-houses being quite equal in design to those of Paris.

Of the other countries of Europe, the only one which deserves remark for its Renaissance buildings is Russia. St Petersburg is, of all the cities of Europe, the one which best merits the title of a city of palaces. From the date at which the city was founded, these are necessarily all Renaissance in character. They are nearly all the works of German or Italian architects, and are unfortunately, for the most part, in the coldest and worst style. The ornaments of the palaces are chiefly pilasters running through two stories, with broken entablatures, &c., and ornaments of the flimsiest rococo. The New Museum, by Klenze, is, however, a marked exception.

Along with architecture, during the period of the Renaissance, Painting and Sculpture (q. v.) and all the other arts took their models from the classic remains which were so carefully sought for and studied. All ornamental work, such as carving, jewellery, and metal-work of all kinds, followed in the same track. Medieval niches and pinnacles gave place to the columns and entablatures of the classic styles, and the saints of the middle ages yielded to the gods and goddesses of ancient Rome.

RENAI'X, a town of Belgium, in the province of East Flanders, picturesquely situated, 24 miles by railway south of Ghent. Brewing, tanning, distilling, and salt-refining are carried on; and fine linen and damasks, woollen fabrics, hats, and tobacco, are extensively manufactured. Pop. 12,000.

RENAN, Joseph Ernest, a renowned French theologian and orientalist, was born in 1823 at Tréguier (Côtes-du-Nord). His first education he received at the hands of the priests who directed the school of his native place. At sixteen years of age, he was sent to Paris, where he entered the seminary of Abbé Dupanloup, to prepare himself for the church. Three years later, he went to Issy, and having completed his philosophical studies there, to St Sulpice. On leaving this, however, he declared himself unable to follow out the path traced for him. The theological and linguistical studies, to which he had devoted himself with rare industry, had led him to results which did not seem to allow him the exercise of priestly functions in his church. He took the place of *répétiteur* in a school, and here prepared himself for an academical career. In 1847, his Memoir *Sur les Langues Sémitiques* ('On the Semitic Languages') obtained the Volney Prize; and the following year, another Memoir of his, *Sur l'Etude du Grec dans l'Occident au Moyen Age* ('On the Study of Greek in the West during the Middle Ages') was crowned. In 1848, he began to publish a periodical, *La Liberté de Penser* ('Liberty of Thought'), in which he embodied some of his most brilliant essays on theology, philosophy, philology, history, and the many variegated branches of his studies, which, however, were all merely preparatory to the great work for which he concentrated all his energies—viz., the investigation of the origin of Christianity, which, according to him, is as human and natural, and has grown out of the history and circumstances of the times, in precisely the same manner as any other event in the records of humanity. His Memoir, *Sur les Langues Sémitiques*, he expanded in 1855 into a *Histoire Generale des Langues Sémitiques* ('General History of the Semitic Languages'), which, with all its shortcomings, is the most methodical and brilliant compilation on the subject. Of the variety of subjects to which he devoted his time besides, his numerous contributions to the *Revue des Deux Mondes* and the *Journal des Débats*, bear ample witness. In 1850, he published a historical essay, *Sur Averroes et l'Averroisme*, for which he had collected materials on a scientific journey to Italy. In consequence of this he was appointed *Employé* at the Imperial Library in Paris. He further produced translations of Canticles and the Book of Job, with introductions and commentaries (*Le Cantique des Cantiques*, &c., 1860, *et Le Livre de Job*, &c., 1859). In 1860, he was sent by the Emperor on a tour of exploration to Syria and Phœnicia, the results of which, however, published a few years afterwards, fell rather short of the general expectations. On his return, he was elected to the chair of Hebrew professorship at the Collége de France; but his inaugural lecture made him, through its too free handling of theological matters, so obnoxious to those in power, that his course was first suspended, and finally his professorship was taken from him. One of his more recent works, *La Vie de Jésus*, forming Part I. of his *Origines du Christianisme*, in the same way as his *Histoire des Langues Sémitiques* is the first part only of a large work entitled *Histoire générale et Systeme comparé des Langues Sémitiques*, created for a time the profoundest emotion throughout Europe, and, in fact, the whole civilised world, but has been denounced as impious by several French prelates. His various minor essays have been collected into two volumes, respectively called *Etudes d'Histoire Religieuse* (1856) and *Essais de Morale et de Critique* (1859). His later works are, *Histoire des Origines du Christianisme*, *Les Apôtres* (1866), and *Vie de Saint-Paul* (1867). See *North British Review*, 1864; *British Quarterly*, 1863 and 1866, and *Westminster Review*, 1866.

RE'NDSBURG, a strongly fortified town of Prussia, in the province of Slesvig-Holstein, stands at the point of junction of the river Eider and the Kiel Canal, 67 miles north-north-west of Altona by railway. R. is favourably situated for commerce, and carries on an active trade in timber. Pop. 12,460.

RENÉ, or RENATUS I., surnamed 'the Good,' titular king of Naples and Sicily, the son of Louis II., Duke of Anjou and Count of Provence, was born in 1408 at Angers. R.'s paternal grandfather, Louis I., Duke of Anjou, and second son of John the Good, king of France, had been adopted in 1380 by Joanna I., queen of Naples, as her successor; and on his death, a few years afterwards, his son, R.'s father, was crowned king of Naples and Sicily. He, however, did not derive any substantial advantages from this recognition of his presumed rights; and when, on his death and that of his eldest son, Louis II., R., as the next heir, endeavoured to make good his pretensions to the great Neapolitan heritage, he found himself involved in disastrous disputes with numerous other aspirants to the coveted throne. R. had married Isabella of Lorraine, and through her son was also a claimant of the rich territories of Lorraine, and consequently brought upon himself the enmity of his wife's brother-in-law, the Duke of Burgundy, who laid equal claim to the heritage of the ducal House of Lorraine. The best years of R.'s life were spent in the fruitless effort to establish these pretensions; but when, in 1442, his powerful rival, Alfonso of Aragon, took Naples, after a protracted siege, the struggle was virtually decided; and R., recognising at length the futility of his schemes, retired to his hereditary dominions in Provence, and thenceforth occupied himself with the administration of his territories, and with the cultivation of poetry and painting, in both of which he attained a degree of proficiency above the average of his age, as is shewn by the poems and illuminated illustrations by his hand still preserved in the Imperial

Library at Paris. In 1445, R. gave his beautiful daughter Margaret in marriage to Henry VI. of England, and at the same time obtained from his royal son-in-law the restitution of Anjou and Maine, which had remained in the hands of the English since the successful wars of Henry V. This did not, however, prevent R. from taking part in the wars of Charles VII. against the English in 1449; but after a brief stay with the army, R., wearied with the excitement and discomforts of war, retired to Aix in Provence, where for many years he attracted to his court the cultivators of song and romance, while he encouraged manufactures, and augmented the resources of the province by the introduction of improved methods of agriculture, and the importation of various useful trees and plants, and died in 1480, universally regretted by his subjects, among whom the memory of 'the good king René' was long held in great veneration. R.'s sons had died before him; and as with him the House of Anjou became extinct, its territorial dominions lapsed to the French crown, and have since that period formed an integral part of France.

RENEW'AL of a Bill of Exchange is matter of agreement between the parties, and a new bill is granted by the party liable to pay in substitution for the old one. The result is, that the former bill is suspended in its operation till the renewed one arrives at maturity. But the former one is not extinguished, for it revives if the renewed bill is not paid; and even though the renewed bill is paid, an action may be brought on the former bill to recover the interest due upon it.

RE'NFREW (anciently *Strathgryffe*), a county in Scotland, 31 miles long, by 13 broad, is bounded on the N. and W. by the river and Firth of Clyde, on the S. by Ayrshire, and on the E. and N. by Lanarkshire. Area 247 sq. m., or 158,268 acres; pop. (1861), 177,561.

R. is very unequal in its surface, and consequently in the nature and quality of its soil; the highest portion of it, composing two-thirds of its surface, reaches to the height of 1240 feet above the level of the sea, and gradually declines to a level extending to some 12,000 acres. R. was divided in 1815 into the Upper and Lower Wards, with a sheriff-substitute for each. There are extensive mineral deposits in the county, employing a large number of people, and constituting a great source of commerce and wealth. The manufacture of soft goods, comprising silk, cotton, and muslin fabrics, is carried on to a great extent; and the good roads and railways, together with the seaports of Greenock and Port Glasgow, afford ready means of transit both for home and foreign trade. The chief towns, besides these ports, are Renfrew (q. v.), Paisley (q. v.), and Johnstone (q. v.).

Besides the Clyde, and some small streams, there are three rivers of considerable size, called the Black Cart, the White Cart, and the Gryffe.

The number of proprietors is a little over 2600, and the number of occupants 1181. Of the whole acreage of R., there were, in 1859, under grass and hay, 41,598 acres; and under rotation of crops, 75,151, of which there were in wheat, 4764 acres, averaging 35 bushels 2½ pecks per acre; barley, 417 acres, averaging 36 bushels 0½ pecks; oats, 17,097 acres, averaging 37 bushels 0¼ pecks; bere, 106 acres, averaging 34 bushels 2 pecks; beans, 1232 acres—peas, 8 acres, averaging 32 bushels 0¼ pecks; turnips, 3470 acres, averaging 16 tons 0½ cwt.; potatoes, 5729 acres, averaging 5 tons 11½ cwt.; summer fallow, 1840 acres. Of live-stock, there were horses, 3635; cattle, 22,398; sheep, 22,477; swine, 1761.

The old valued rent was £5764. The valuation for 1863—1864 was £340,987, being an increase over that of 1857 of £58,791, exclusive of railways, which in 1862—1863 were valued at £52,550. The parliamentary constituency, returning a member of parliament, in 1862 was 2313.

R. was the chief patrimony of the Stewards of Scotland, granted to them in 1404 by Robert III., since which time the eldest son of the reigning sovereign has borne the title of Baron of Renfrew.

RENFREW, an ancient royal, parliamentary, and municipal burgh, capital of the county of the same name, stands on the south bank of the Clyde, 5 miles west-north-west of Glasgow. It contains an educational institution called the Renfrew Grammar School and Blythswood Testimonial, which was originally endowed by charter of Robert III., and is in part maintained by the Town Council. On the banks of the Clyde is a wharf, at which the Glasgow steamers touch. Silk and muslin fabrics are woven; and many of the inhabitants are employed in iron-works and in shipbuilding, which branches of industry have within recent years become important here. Pop. (1861) of royal burgh, 3412.

RENNEL, James, a well-known English geographer, was born near Chudleigh, Devonshire, in 1742, and entered the navy as a midshipman at the age of 15, distinguishing himself under Admiral Parker at the siege of Pondicherry. At the age of 24, he left the navy, and enlisted as an officer of engineers in the East India Company's army, rising through the influence of his distinguished services under Clive to the grade of major. Soon afterwards, he was transferred to the post of surveyor-general of Bengal, an office more in keeping with his tastes. While serving in the army, he had prepared and published a *Chart of the Bank and Currents of Cape Agulhas* (1768), which attracted the general notice of geographers; and having retired from office (1782) with a pension of £600, he followed up this work by a succession of geographical works on India, the chief of which was *Memoirs of a Map of Hindustan* (Lond. 1783), new editions of which appeared in 1788, 1793, and 1800, each of which merits to be considered a distinct work. But his geographical investigations took a wider scope, for in 1792 he published a *Memoir of the Geography of Africa*, from the communications of Major Houghton, and the relations of Ledyard and Hornemann; and in 1798, he aided Mungo Park in the arrangement of his travels, illustrating them by a map. R. had been elected a member of the Royal Society in 1788. The subject of the correctness of the ancient geographers being at that time much discussed, R., though wholly ignorant of Greek, undertook the vindication of Herodotus (whose works he became acquainted with through the medium of a translation), and published in 1800 his *Geographical System of Herodotus Examined and Explained*, a work of unrivalled merit, displaying as it does one of the grandest combinations of acuteness, sagacity, and research. A second edition was published in 1830. In 1814, appeared his *Observations on the Topography of the Plain of Troy;* and two years afterwards, *Illustrations (chiefly Geographical) of the Expedition of the Younger Cyrus, &c., and of the Retreat of the Ten Thousand.* After his death, which took place at London, 29th March, 1830, there were found among his papers several MS. works, including the *Investigation of the Atlantic Currents and those between the Atlantic and Indian Oceans* (Lond. 1832), in the composition of which book he examined the logs of all the ships of

war and Indiamen which had traversed those seas for about 40 years previous, and reduced their observations to a general system; and *A Treatise on the Comparative Geography of Western Asia*, with an atlas, ancient and modern (Lond. 1831), a work of great labour and research, which had been prepared by the royal command, and the publication of which was partially defrayed at the king's expense. R. was one of the most remarkable men of his time; his works exhibit throughout the most earnest perseverance and industry, sound judgment, and wonderful sagacity.

RENNES (*Redones* of the Romans, *Condate* of the Gauls), formerly the capital of the province of Bretagne, now the chief town of the dep. of Ille-et-Vilaine, is situated at the confluence of the rivers Ille and Vilaine. It is divided into the upper or new town, and the lower or old town. It is surrounded by ancient walls, flanked with towers, beyond which lie extensive suburbs. Three bridges unite the two divisions of the town, the older portions of which lie on the left bank of the Vilaine, and are often exposed to serious damage from inundations. The most noteworthy of the public buildings are the cathedral—a large but inelegant specimen of early Gothic; St Peter's Church, with its two grand old towers; and the town-hall, a fine modern building. R. is the see of a bishop, and the seat of a High Court of Jurisdiction for Ille-et-Vilaine and several other adjacent departments, and has tribunals of First Instance and of Commerce. As the focus of main and branch-lines of railway between Paris and the north-west of the empire, and commanding good river and canal navigation, R. is favourably situated for commerce; and in addition to the transport of the abundant farm-produce of the neighbouring districts, it carries on a considerable trade in its own manufactures, which include cotton and linen yarns, flannel stockings, lace, sail-cloths, earthenware, &c. Pop. (1866) 49,231.

RE'NNET consists of the inner lining of the true stomach (see DIGESTION) of the sucking-calf, and depends for its use upon the acid gastric juice contained in it. It is prepared by removing the stomach from the animal as soon as killed, and scraping off the outer skin and all superfluous fatty matter. The membrane is then salted for some hours, and stretched out to dry. If perfectly dried, it will keep for a long time. When used, a small piece is taken and soaked in a little whey or water, and then added to the milk intended to be curdled.

RENNETT, the common name, not only in English, but, with slight modifications, in French, German, and other languages, of a class of apples, including many of the most beautiful and pleasant varieties. They are of very regular and nearly globose shape; their skin has generally a rusty tinge, and often a kind of unctuousness to the touch; their flesh is finely granular; and besides being sweet and agreeably acid, they have a peculiar aromatic flavour. They do not keep well. The trees have a very regular habit of growth, and are very suitable for dwarf standards. The name R. seems to be originally French—*Reinette*, Little Queen.

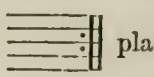
RENNIE, JOHN, an eminent civil engineer, was born at Phantassie, near East Linton, East Lothian, 7th June 1761. His preliminary education was obtained at the parish-school of East Linton, and supplemented by two years at Dunbar, where he was indoctrinated into pure mathematics. After being for some time a workman in the employment of Mr Andrew Meikle, celebrated in connection with the Thrashing-mill (q. v.), he proceeded to Edinburgh, where he attended the lectures on natural philosophy by Dr Robison, and those on chemistry by Dr Black (q. v.). Furnished with a recommendation from Professor Robison, he visited (1780) the works of Messrs Boulton and Watt at Soho, near Birmingham, and was immediately taken into employment by that eminent firm. Here his mechanical genius soon displayed itself; and so highly did Watt esteem R., that he gave him, in 1789, the sole direction of the construction and fitting-up of the machinery of the Albion Mills, London; and the ingenious improvements effected in the connecting wheel-work were so striking, that R. at once rose into general notice as an engineer of great promise. Abundance of mill-work now flowed in upon him, and the thorough efficiency of his workmanship greatly contributed to his fame. To this branch of engineering he added, about 1799, another—the construction of bridges; and in this branch also his pre-eminent talent and ingenuity displayed themselves. The elegance and solidity of his constructions, the chief of which were raised at Kelso, Leeds, Musselburgh, Newton-Stewart, Boston, New Galloway (and at other places afterwards mentioned), were universally admired; R.'s greatest work in this department was the Waterloo Bridge over the Thames, said to be the noblest structure of its kind in the world, and it certainly combines in the happiest proportions the qualities of grandeur and simplicity. It was commenced in 1811, and finished in less than six years, at a cost of more than £1,000,000. Another of his works is the Southwark Bridge, which was built on a new principle, cast-iron arches resting on stone piers, and was finished in four years at an expense of £800,000. He also drew up the plan for the London Bridge, which, however, was not commenced till after his death. We have only space to enumerate the rest of his great engineering achievements: he superintended the execution of the Grand Western Canal in Somerset, the Polbrook Canal in Cornwall, the canal joining the Don and Dee in Aberdeen, that between Arundel and Portsmouth, and chief of all, the Kennet and Avon Canal between Newbury and Bath. The London Docks, the East and West India Docks at Blackwall, with their goods' sheds, the Hull docks, the Prince's Dock at Liverpool, and those of Dublin, Greenock, and Leith, were all designed, and wholly or partially executed under his superintendence. He also planned many improvements on harbours and on the dockyards of Portsmouth, Chatham, Sheerness, and Plymouth; executing at the last-mentioned port the most remarkable of all his naval works, the celebrated Breakwater. R. died October 16, 1821, and was buried in St Paul's Cathedral. R.'s great merit as an engineer consisted in his almost intuitive perception of what was proper to be done to effect the assigned purpose. Another striking characteristic of his works is the remarkable combination in them of beauty and durability. In this respect, R. had no rival; and though his works are frequently objected to on the ground of their expensiveness, yet their lasting qualities will in the end more than compensate for this. In person, R. was of extraordinary stature and herculean strength—characteristics which have for a lengthened period distinguished his family, and with reference to which numerous tales are still current regarding many of his relatives.

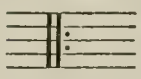
RENNIE, GEORGE, an eminent English civil engineer, and the eldest son of the preceding, was born in Surrey, January 3, 1791, and at the age of 16 entered the Edinburgh University, being placed

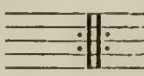
under the charge of Professor Playfair, in whose house Earl Russell, then an Edinburgh student, also at that time resided. After attending a course of classics, mathematics, chemistry, and natural philosophy, he returned to London in 1811, and commenced the practical study of engineering under his father. In 1818, he was appointed the superintendent of the machinery of the Mint, and at the same time aided his father in the planning and designing of several of his later works. After his father's death in 1821, R. entered into partnership with his younger brother, John (now Sir John Rennie), as engineers and machinery constructors; and during the existence of the firm, it carried on an immense business, including the execution of most of the works which had been planned by the elder Rennie, and the completion of those which he had left unfinished. Their operations included the construction of bridges, harbours, docks, ship-yard and dredging machinery, steam-factories, both in Great Britain and on the continent, and many of the great naval works at Sebastopol, Cronstadt, Odessa, Nicolaiev, and in the principal ports of England; they also made the coining machinery for the mints at Calcutta, Bombay, Lisbon, Mexico, and Peru; the biscuit, chocolate, and flour mills at Deptford, Gosport, and Plymouth; and furnished marine engines for the war-ships of England, Russia, France, Italy, Mexico, &c. Besides these multifarious labours, they built ships both of wood and iron, drained large tracts of land in the midland counties of England, and R. superintended the construction of several continental railways. He was elected a Fellow of the Royal Society in 1822, and was subsequently enrolled in similar societies at Dublin, Turin, Rotterdam, &c. He was the author of 'Experiments on the Strength of Materials,' 'The Frictions of Solids,' and 'The Frictions of Fluids,' published in the *Philosophical Transactions*. He also contributed Memoirs to the *Transactions* of the Civil Engineers. He died in 1866. His brother, SIR JOHN, was knighted on the occasion of the opening of the new London Bridge (1831), one of their works, and retired from the firm in 1845. He subsequently practised as an architect; while his elder brother carried on, with the aid of his two sons, the business of the firm.

RENT, in Political Economy, is a term applied to the profits drawn from land, houses, or other immovable property, termed in England 'real property.' It is colloquially applied to these profits only when the property is hired by a tenant who pays for the use of it. It was long before a distinction was made between such letting and hiring and that of any other commodity, such as a ship or a wagon. But political economists found that there was a fundamental distinction, affecting large questions not only in political economy but in state politics. These are connected with the specialty that other profits, whether from the letting of articles or otherwise, arise out of the acts of those to whom the articles belong; but the rent of land is a fund that exists through external causes, over which the owner has no control, and in certain conditions *must* exist whoever may draw it. When 'the theory of rent,' as it was termed, dawned upon the economists, and was but partially seen, they developed it in different formulas, which appeared to be different theories, but in reality were crude forms, tending, though complicated in themselves, to the simple principle, that the pressure of population on the means of subsistence creates rent on those lands where the means of subsistence can most easily be produced. In an enlarging and aggrandising country like Britain, the phenomenon is in constant gradual operation; but it will be best illustrated by supposing an instance of sudden and extensive action. Suppose there is an island in which 1000 people find enough for their wants in the natural produce of its most fertile soil. Suddenly 500 people become added to the population, and an increase of the existing food to the extent of one-half is required. The shape in which this increase will take place will be competition, by the offer of an enhanced price for food, and that enhanced price will tempt people to bring under cultivation the inferior lands. The owners, however, of the old rich lands will not see their neighbours getting prices a third higher than themselves; they, too, will sell their produce at the market price, and the difference between this and the old value will be *rent*. It is of no moment, in the economic question of the existence of the element, that the owner of the rich soil does not let it: if he eats his bread cheaper than his neighbour, that is merely the form in which he derives the advantage of *rent*. The importance of this view, both in politics and economics, is that rent *must exist, and cannot be got rid of*. Whoever has at his command better land than the worst that is cultivated, holds rent. It is in vain, therefore, to think of destroying the 'monopoly,' as it is sometimes called, of landowners; it revives as naturally by an economic law, as water finds its level by a physical law. If you were to divide all the land in Britain to-morrow in equal portions among the inhabitants, the value of it would be greatly deteriorated by the change, but in time some patches would become more valuable than others, and worth 'rent,' while the frugal and industrious would gradually be absorbing the portions of the idle and extravagant, and accumulating estates. In fact, to the mere consumer, it is of no moment who has the land, provided it is in the hands that can render it most productive. To this end, it is more profitable that the land of a country should be in the market, and obtainable by those who, being ready to give most for it, are able to work it to most profit. In France, where land is divided among the owner's descendants, the consequent breaking up into small patches, not necessarily in the hands of persons able or willing to cultivate them, is detrimental to the value of the land at large. On the other hand, an entail system, such as that which predominated, and still to a certain extent exists in Scotland, is detrimental, by keeping the land out of the market, and necessitating that it shall belong to a certain person, who has perhaps neither the ability nor the capital to turn it to its best purpose. In the struggle which terminated in the establishment of free trade in 1846, the 'theory of rent' was referred to with much alarm, and it was said that when grain was brought from abroad, a reversal of the action creating rent would occur, from the inferior lands falling out of cultivation. Some free-traders admitted this as a necessary evil, but others said that the expansion given to commerce would increase the demand for the produce of the soil, while the home-growers would have a monopoly from their vicinity. In fact, the increase of trade and riches has been so great, that the value of land has greatly increased since the establishment of free trade, and that although half our bread-stuffs come from abroad. The great increase has been in the rearing of butcher-meat, which the increased wealth of the people has enabled them to buy.

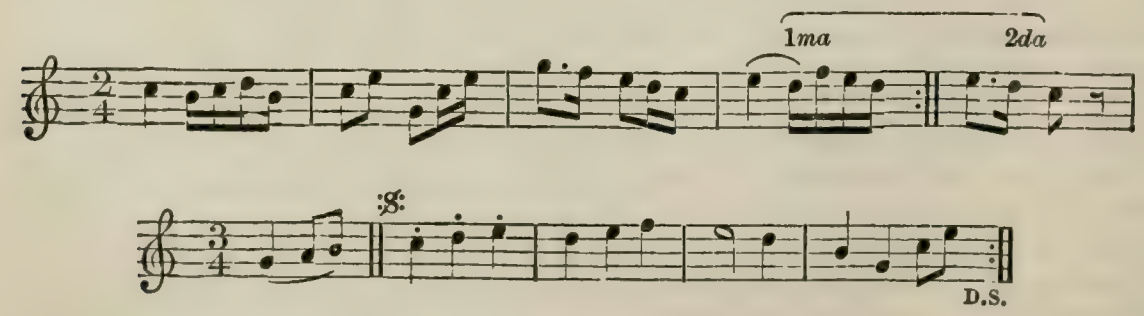
RENT, in English Law, is an incident to the tenure created between a lessor and a lessee. It consists not necessarily of money, but may be a quantity of corn, or a peppercorn, or a flower. Where lands are held rent-free, it is usual for the landlord to reserve some nominal rent, merely as







an acknowledgment of tenancy. In the ordinary case of leases, a payment of a fixed sum of money is reserved annually for the benefit of the landlord. It is incidental to rent that the landlord can, if it is not duly paid, distrain the tenant's goods, or, indeed, any person's goods found on the premises; i. e., the landlord can seize these and sell them without any judicial authority, in order to pay the rent. No express agreement between landlord and tenant is necessary to give the landlord this power of distress. The rule is, that rent issues out of all and every part of the premises, and whatever goods are found on any part of the premises can be distrained by the landlord. Sometimes the owner of land gives a third party a right to a certain rent out of his lands, by way of security, and it is called a rent-charge; the party entitled to the rent-charge having power to distrain also for the rent, though having no other right to the lands. In Scotland, though the general rules as to rent do not substantially differ, the landlord's power of sequestration is not identical with the English power of distress. See LANDLORD AND TENANT.



RE'NTON, a small town in the county of Dumbarton, and two miles north of the town of that name, on the right bank of the Leven. Smollett, the novelist and historian, was born in the neighbourhood, and is commemorated by a monument in the town. Pop. (1851) 2390; (1861) 2987, who are employed in the printing, dyeing, and bleaching works on the Leven.

RENUNCIA'TION, as a legal term, is the renouncing or abandoning of a right. In England, the term is used solely in reference to an executor who has been nominated in a will, but who, having an option to accept it, declines to do so, and in order to avoid any liability, expressly renounces the office. This he may do by letter addressed to the Court of Probate.—In Scotland, the term is also used in reference to an heir, who is entitled, if he pleases, to succeed to the ownership of heritable property, but, from the extent of the incumbrances, prefers to renounce the character of heir. So the renunciation of a lease in Scotland is used in the same sense as the surrender of a lease in England.

RENWICK, JAMES, LL.D., an American author and physicist, was born in New York in 1792, and graduated at Columbia College, New York, in 1807. In 1820, he was appointed Professor of Chemistry and Physics in that college, a position he held until 1854. In 1838, he was appointed by the United States government one of the commissioners to explore the line of the boundary, then settled by the Ashburton treaty, between Maine and New Brunswick. In addition to his collegiate duties, he wrote the biographies of Robert Fulton, David Rittenhouse, and Count Rumford, in Sparks's *American Biography;* a *Memoir of De Witt Clinton* (1840); *Treatise on the Steam-engine* (1830), &c.. His text-books, *Outlines of Natural Philosophy* (1822), and *Outlines of Geology* (1838), were the first works of their kind published in the United States, and, with his other educational works, have passed through numerous editions. He died in 1863.

REPAI'RS is the legal as well as popular term to denote the repairs done to a house or tenement by a tenant or landlord during the currency of the lease. In England, the burden of repairs is at common law thrown on the tenant, so that unless the lease expressly say that the landlord is to do the repairs, the tenant will be bound, but generally the lease states who is to do the repairs; and it is only ordinary repairs that the tenant is bound to do. In the lease of farms, the tenant is bound only to keep the house in repair, and not the out-buildings, though he is bound to keep the fences in repair. If the landlord is bound to do the repairs, and fails to do them, the tenant is not entitled to quit the premises on that account, though he will be entitled to sue the landlord for damage caused by the want of repairs. In Scotland, the landlord is bound at common law to put the premises into tenantable repair at the commencement of the lease. The tenant is then bound to keep them in ordinary repair, but not to keep them in repair where some hurricane or extraordinary cause has done injury.

REPEA'T, in Music, a character indicating the repetition of the part or strain to which it applies. It consists of two perpendicular lines through the staff, with dots before them and between the lines of the staff—  placed at the close of the strain to be repeated. When a series of notes has to be repeated from the beginning of the piece, this sign is inserted at the place where we have to return to the beginning. But when the repetition is not from the beginning of the piece, a reversed repeat  must be placed at the point where the repetition begins, the passage to be repeated being enclosed by the two signs. When the following strain is also to be repeated, we have the dots placed on both sides of the repeating sign  . When a passage of some length is to be repeated, with an alteration at the end, a curved line with the figure 1, 1*ma*, or *prima volta* (Ital. first time) is placed over the part which is to be altered, the sign of the repeat follows, and then the altered termination with 2, 2*da*, or *seconda volta* (Ital. second time) placed over it.

The words *Da Capo*, abbreviated D. C. (Ital. from the beginning), indicate that a piece is to be repeated from the beginning. But if that repetition is only to extend to a particular point, at which the movement or piece finally closes, that point is indicated by the word *Fine* (Ital. end), or the letter F. If, however, the repetition is to begin, not from the commencement of the piece, but from another point,

the sign 𝄋 is placed over the point, and the words *dal segno*, abbreviated D.S. (Ital. from the sign), are used to indicate the point after which the repetition is to begin.

REPETITION, in Scotch Law, means the repayment of money which had been received by mistake or ignorance. The form of action by which money is so recovered was, in the Roman law, called *condictio indebiti*, and the law of Scotland adopts the same expression. The maxim is, that if money has been paid under some mistake as to the law, it cannot be recovered; but if it was paid under a mistake as to a matter of fact, then it may be recovered. In England, the same doctrine holds, and the action is called an action for money had and received.

REPLEA'DER, in English Law, is a right to plead again, or deliver a fresh pleading, in consequence of the issue which had been joined not meeting or exhausting the real point in dispute. This right is much abridged, in consequence of the liberality now used in amending the record.

REPLE'VIN, in English Law, is a form of action by which goods which have been seized under an illegal distress are taken back (security being given to the amount for which the goods were distrained), and the action of replevin commenced, to try the legality of the seizure.

REPLICA'TION, in the English Common Law, means the pleading of the plaintiff in answer to the defendant's plea. The plaintiff's first pleading is the declaration, which is answered by the defendant's plea, and which in turn is answered by the plaintiff's replication.

REPO'RTING, PARLIAMENTARY. Accounts of single speeches, and, at times, of entire debates in the English parliament, have come down to us from a very early period, and in the voluminous work entitled the *Parliamentary History of England*, we possess the most valuable historical work in our language. The earlier volumes of the Journals of the House of Commons contain short notes of speeches, which the clerks made without the authority of the House; but all the later volumes record nothing but the votes and proceedings—the *res gestæ*, in fact. Sir Symonds d'Ewes, who may be considered our first parliamentary reporter, has left us a journal of Queen Elizabeth's parliaments. The session of 1621 was also reported from notes taken by a member. The Commons' Journals contain notes of speeches in the parliaments of James I. and James II. Rushworth, assistant-clerk in the Long Parliament, 1640, took down in a species of shorthand any speech of importance, and furnished Charles I. with a copy of the king's own speech when he made the attempt to seize the five members. His account of *Remarkable Proceedings in Parliament* forms one of the most valuable portions of his *Historical Collections*. We are also indebted to Thurloe and Gray for notices of what occurred in parliament. During the reign of William III., a member now and then sent a copy of his speech to the newspapers, for printing which, however, they were sometimes called to account. In the reign of Queen Anne, a monthly pamphlet, called the *Political State*, gave an outline of the debates in parliament. In the reign of George I., the *Historical Register*, published annually, professed to give reports of parliamentary speeches. The *Gentleman's Magazine* began a monthly publication of the debates, the number for August 1735 containing a report of the debate in the House of Lords on the previous 23d January. Cave, the publisher, continued the practice in succeeding numbers, and his systematic proceedings are thus described by Sir John Hawkins: 'Taking with him a friend or two, he found means to procure for them and himself admission into the gallery of the House of Commons, or to some concealed station in the other house, and there they privately took down notes of the several speeches, and the general tendency and substance of the arguments. Thus furnished, Cave and his associates would adjourn to a neighbouring tavern, and compare and adjust their notes; by means whereof, and the help of their memories, they became enabled to fix at least the substance of what they had lately heard and remarked. The reducing this crude matter into form was the work of a future day and an abler hand—Guthrie, the historian, whom Cave retained for the purpose.' There was, however, no publication of the debates during the sitting of the Houses; parliament was always prorogued before anything said in the course of the session was given in the magazine. At first, the names of the speakers were cautiously indicated by the first and last letter only, and in many cases the speaker's name was wholly omitted. Growing bolder by degrees, Cave printed the names at length. The House of Commons soon took the alarm. The publication of the debates of either House had been repeatedly declared to be a high breach of privilege. Sir Symonds d'Ewes gives us a resolution of the Lower House in the 31st Eliz. 1588, that 'speeches used in this House be not any of them made or used as table-talk, or in any wise delivered in notes of writing to any persons whatever, not being members of this House.' In 1698, the Lords agreed to a standing order, which is still unrepealed, declaring 'that it is a breach of the privilege of this House for any person whatsoever to print, or publish in print, anything relating to the proceedings of the House, without the leave of this House.' The Commons followed up several previous resolutions to the same effect, by ordering, in 1728, 'that it is an indignity to, and a breach of, the privilege of this House, for any person to presume to give, in written or printed newspapers, any account or minute of the debates or other proceedings; that upon discovery of the authors, printers, or publishers of any such newspaper, this House will proceed against the offenders with the utmost severity.' In 1738, Speaker Onslow called the attention of the House to the breach of its standing orders by Cave and others. Sir Thomas Winnington exhorted the Commons not to be less jealous of their privileges than the other House, which had lately punished some printers for publishing their protests. 'What will be the consequence,' he asked, 'if you allow these reports to go on unchecked? You will have the speeches of this House every day printed, even during your session, and we shall be looked upon as the most contemptible assembly on the face of the earth.' The result was another thundering resolution against the publication of debates 'either while parliament is sitting or during the recess,' and a threat to proceed against offenders with the 'utmost severity.' The reports, notwithstanding, still appeared, but under the disguise of 'Debates in the Senate of Lilliput,' in the *Gentleman's Magazine;* and 'Debates in the Political Club,' in the *London Magazine*. The celebrated Dr Johnson was employed by Cave in the composition of his parliamentary debates, and the reports from 1740 to 1743 are held to have been entirely prepared by him; sometimes with the assistance of Guthrie, a hack-writer, who had a good memory, and used to bring home as much as he could recollect from the House; and sometimes, according to Boswell, with no other aid than the names of the orators and the side they took. When it was observed to Johnson that he dealt out reason

and eloquence pretty equally to both parties, he remarked: 'I took care that the Whig dogs should not have the best of it.' It was not till 30 years later that the parliamentary debates descended from the magazines to the newspapers. The latter had, however, for some time resolved to report the debates (Woodfall's *Junius*, iii. 345), and they took advantage of the popular excitement arising out of the Luttrell-Wilkes election for Middlesex, to try the right of the House to interdict the publication of its proceedings.

The ever-memorable contest between parliament and the press began at the close of the year 1770. The House of Commons followed up another solemn threat by prompt action. Two printers, Thompson and Wheble, were ordered to attend at the bar, and, upon their contempt, were ordered into custody. On the 12th of March 1771, complaint was made against W. Woodfall, printer of the *Morning Chronicle;* J. Miller, of the *London Evening Post;* and four other printers of London daily papers, for printing the proceedings of the House. The debates were unusually violent; there were 23 divisions; and the House did not adjourn until four A.M. The printers were ordered to attend. Some surrendered, and on asking pardon on their knees at the bar, were discharged. Miller, not surrendering, was ordered into the custody of the serjeant-at-arms. His messenger arrested Miller within the precincts of the city of London, and was immediately given into custody by Miller for assault, and carried before the Lord Mayor, the Right Hon. Brass Crosby. The deputy serjeant-at-arms attended before the Lord Mayor, and explained the circumstances; but his lordship declared the Speaker's warrant illegal, discharged Miller from custody, and committed the messenger for assault. Wheble and Thompson had been carried respectively before Aldermen Wilkes and Oliver, who immediately discharged them, and bound them over to prosecute, and the Speaker's messenger to answer a charge of assault and false imprisonment. The House of Commons was furious. It had had enough of Wilkes, but ordered the attendance of the Lord Mayor (a member of the House) in his place, and also of Alderman Oliver. The aldermen of London attended the House, and pleaded their own cause, alleging that their charters exempted the citizens from any law process being served upon them except by their own officers. The House ordered its various resolutions to be read, prohibiting the reporting of its proceedings by any, even its own members, and then committed Alderman Oliver to the Tower. The Lord Mayor, who was suffering from gout, was excused from further attendance that day, but Wilkes was ordered to attend at the bar on the 8th of April. The defiant alderman was ready for the fray, but the House evaded the meeting by adjourning from the 7th to the 9th. The Lord Mayor, on the 27th, was sent to join Alderman Oliver in the Tower. The city of London loudly protested against the arbitrary proceedings of the House, and the whole country responded to the appeal. The power of parliament to imprison ceases at the end of the current session, and on the day of prorogation, July 23, the Lord Mayor and Alderman Oliver marched out of the Tower in triumph, and at night the city was illuminated. A few days afterwards, the Speaker's messenger who had arrested Wheble was tried at Guildhall for the assault, found guilty, fined 1*s.*, and imprisoned for two months in the Compter. Next session, the House of Commons tacitly acknowledged itself beaten. The printers defied the House, continued to publish their proceedings, and slept, notwithstanding, secure in their beds. In a short time, the House of Lords also conceded the point. The victory was complete, and no attempt has since been made to restrain the publication of the debates and proceedings of parliament. The resolution affirming that it is a high indignity to, and 'notorious breach of, the privileges of the House to publish the debates,' still remains unrevoked on the Journals. Although debates are now daily cited in parliament from printed reports, and galleries have been constructed for the accommodation of the reporters, yet for some years after the triumph of the press, the gallery of the Lower House was occasionally shut during debates. During the American war, the public were more than once excluded from the gallery for a whole session. It is still in the power of any member, who may call the Speaker's attention to the fact that 'strangers are present,' to exclude the public and the reporters from the House. This power has frequently been exercised during living memory, but on such occasions some one or more members who have dissented from this course have taken notes of the speeches, and have avowedly sent them to the newspapers.

The old machinery of newspaper reporting was susceptible of immense improvement. One of the Woodfalls (a brother of the Woodfall of Junius) had so retentive a memory that he went by the name of 'Memory Woodfall.' When editor of the *Morning Chronicle*, he used to listen to a debate in the gallery, and write it out next day, the taking of notes being at that time forbidden. The employment of only one reporter for the whole night necessarily caused great delay in the publication of the paper, Woodfall's journal sometimes not being ready until nine or ten o'clock at night. The first great improvement was made by Mr Perry, a native of Aberdeen, who succeeded Woodfall in the management of the *Morning Chronicle*. He established a corps of parliamentary reporters to attend the debates of both Houses every night in succession. He thus brought out the night's debate on the following morning, anticipating his rivals by ten or twelve hours. The superior excellence of the reports thus obtained, as well as their more rapid publication, soon made the new system universal. The improvement in the reports of the debates from the period of the American war until the year 1815, was but gradual. At the close of the war, however, public attention being directed with almost exclusive anxiety to domestic affairs, the publication of parliamentary debates became an object of national importance, and in the course of a few years assumed its present full, detailed, and accurate character. Increased facilities for the discharge of their important and arduous duties were from time to time given to the reporters. Formerly, they had no means of entering the Strangers' Gallery except those which were common to the public generally. On days when an interesting debate was expected, they were obliged to take their places on the stairs early in the forenoon, and, after standing there for many hours, to depend for their chance of getting in by battling their way in the crowd when the door opened. It happened one night during Mr Pitt's premiership that the gallery was more than usually thronged in expectation of an important speech from the minister. The reporters, unable either by force or entreaty to obtain even tolerable accommodation, took counsel together. They left the House; and next morning, 'instead of the rounded periods of the minister, there appeared nothing but one dire blank, accompanied by a strong comment on the grievance in which it had originated.' Mr Speaker Abbott, not, as it was believed, without concert with the vexed and aggrieved minister, immediately

directed the appropriation of the uppermost bench of the gallery to the reporters' exclusive use, with a door in the centre, by which they alone had a right to enter. Soon after, a small 'Reporters' Room' was added. The Lords followed the Lower House in providing accommodation for the press. During the debates on Catholic emancipation, a small space below the bar was railed off for them, and a session or two afterwards, a seat was formally set apart for the reporters. When the Houses of Parliament were destroyed by fire in 1834, an exclusive gallery was allotted to the reporters in both chambers of the temporary structure in which the legislature held its sittings. This arrangement has been continued in the splendid new Palace of Westminster, in which the two Houses now hold their deliberations. In the House of Lords, the Reporters' Gallery faces the throne and the woolsack, and is one of the most prominent internal features of the edifice. Complaint having been made of the inaudibility of the speakers, their lordships appointed a select committee, examined the reporters, the architect, &c., and took all possible measures to make themselves heard in the gallery. In the House of Commons, the Reporters' Gallery is behind the chair. Both Houses provide them with rooms and other conveniences for transcribing their notes. In the Lower House, one of the committee rooms has been set apart for their use; and a room occupying the site of the old Star Chamber has recently been given to them for a club-room.

The modern process of parliamentary reporting may be best described by a sketch of the arrangements made by the *Times* newspaper for a due and expeditious transcript of the debates. The *Times* parliamentary corps is sixteen in number, who are equally divided between the two Houses. When one House rises, the entire corps is available for duty in the other, so long as it sits. It thus happens that one of a series of reporters is constantly in the gallery of the Lords, and another in the Commons. Like sentinels, they cannot leave their places until they are relieved by a colleague, but this relief takes place with unvarying regularity every quarter of an hour. When both Houses are sitting, each reporter has thus an hour and three-quarters for the work of transcribing his shorthand notes for the printer—a sufficiently short interval, when it is remembered that a moderate speaker will fill three-quarters of a column, and a rapid speaker not unfrequently a column, in a quarter of an hour. When his turn again comes round, each reporter must be ready to resume the duty of note-taking, and afterwards that of transcription for the press. By maintaining this quick succession of reporters, the process of writing for the press is never interrupted until the whole debate of the evening in both Houses is in the hands of the printer. A long speech may thus be said to extend from the mouth of the speaker to Printing House Square. A part will be wet with ink on the reporters' table; one section will be travelling over Westminster Bridge, and another over Blackfriars Bridge, in swift relays of cabs; a portion, becoming larger every few minutes, will be in the hands of the compositors, and a proof-sheet ready printed, of the earlier passages, will be on the desk of the editor. On some few occasions, when a minister has been more than usually anxious to secure the accurate publication of important statements, a proof impression of a verbatim report of nearly the whole of his speech has been placed in his hands, to his extreme astonishment, as soon as he resumed his seat. The mechanical arrangements of the printing-office are equally designed to secure expedition and accuracy. The parliamentary system of the other morning newspapers resembles that of the *Times*, but as the numerical strength of their corps does not quite reach that of the leading journal in any case, and sometimes falls considerably below it, the periods of note-taking and 'relief' proportionately vary. A still more startling application of modern science exists in the introduction of the electric telegraph into the Houses of Parliament, by means of which portions of parliamentary speeches are in the hands of newspaper editors at Birmingham, Liverpool, Edinburgh, &c., and may be read by the public in those towns, before the speaker has resumed his seat.

No parliamentary reporter now thinks of relying upon his memory: all take notes, and the great majority write some system or other of Shorthand (q. v.). A few years ago, the object desired by newspaper proprietors was not a literal report, but what may be called the spirit of a speech—a faithful abridgment, in fact, of the sentiment, matter, and style of the speaker. But parliamentary reports may now be said to err on the side of diffuseness rather than brevity, the debates of a single evening not unfrequently occupying between 20 and 30 columns of small type. It is well that the chief speeches should be reported with a fulness and correctness that astonish every one who hears them delivered; but the tendency to report at almost the same length inferior speeches, containing the same ideas in more diluted language, has gone far to make the parliamentary debates less readable of late years.

It only remains to say a few words respecting *Hansard's Parliamentary Debates*, the only publication since the *Mirror of Parliament* which professes to give all the speeches fully and accurately. We have already pointed out (see HANSARD) that no staff of reporters is engaged for this work, and that when members quote *Hansard*, for the purpose of convicting an opponent of inconsistency, they are fully aware they are citing from the report of some daily journal; but they take it for granted the passage has been specially brought under the notice of the speaker by the editor of that publication, and it is therefore presumed that the report is authentic. *Hansard*, however, has no representative in the Gallery, and it is sometimes said that members assume so much licence to correct, add, and erase, that the historical value of this record is materially lessened. The historian of party struggles, who, when he approached the year 1805, had to take leave of the *Parliamentary History*, remarks: 'It requires no little resolution to sink a shaft into that solid mass of mixed ore and rubbish which succeeds it—viz., *Hansard's Parliamentary Debates*—and which, however valuable for the purpose of detecting individual inconsistencies, will perhaps render the debates of this century as little known as those of the time of Queen Anne. These voluminous reports of unimportant debates will in time form rather an embarrassing monument of the vanity of our senators.'—See Cooke's *History of Party*, vol. iii. p. 458.

The constitutional importance of the present system of parliamentary reporting can scarcely be overrated. It enables the entire people to be present, and in a manner to assist in the deliberations of parliament. The English orator addresses, indeed, not only the assembly of which he is a member, but, through it, the civilised world. Publicity has become one of the most important instruments of parliamentary government. Long before a measure can be adopted by the legislature, it has been approved or condemned by the public voice; and, living and acting in public, parliament under a free representation has become as sensitive

to public opinion as a barometer to atmospheric pressure. 'No circumstance in the history of our country—not even parliamentary reform—has done more for freedom and good government than the unfettered liberty of reporting; and of all the services which the press has rendered to free institutions, none has been greater than its bold defiance of parliamentary privilege, while labouring for the interests of the people.'—See May's *Constitutional History of England;* also Knight Hunt's *Fourth Estate;* Andrews' *History of British Journalism;* a few papers in *Chambers's Journal* in 1834 (which the last-cited author declares to be among the best contributions to the history of the newspaper press); Wade's *British History;* Dod's *Parliamentary Companion*, 1864.

In continental countries enjoying constitutional government, official short-hand writers are usually appointed by the government to report the debates, and these reports may, under certain restrictions, be transferred to the columns of the press. In the United States, particular speeches delivered in Congress are fully reported and generally read; but complaints are made by members that the New York and other journals do not give sufficient space to a report of the proceedings of Congress.

REPOUSSÉ, a French term applied to a peculiar method of ornamentation in metal-work, resembling embossing; but the effect is produced by hammering up the metal, which is generally thin, from the back, and when a rude resemblance of the figure to be produced is thus formed, it is worked up by pressing and chasing the front surface. The finest specimens of this art are of the *cinque-cento* or 16th c. period, by Benvenuto Cellini. They were generally executed in the precious metals, but copper, iron, and steel were also used, and consisted of cups, vases, shields, &c. Cellini carried the art to France, where it has of late been much developed. A. Vechte, a Frenchman, at present settled in England, has again brought it to a degree of excellence nearly equalling that of the Italian school in the 16th century. His works exhibited in the Exhibitions of 1851 and 1862 are amongst the most remarkable art-productions of the present century. Much common repoussé work is done in Birmingham, in the soft white metals, such as pewter and Britannia metal; and as these are easily worked, and can afterwards be electroplated, so as to hide the quality of the material, they are in considerable demand. After they are hammered up from the inside, they are filled with liquid pitch, and set by until it becomes solid. Then they are modelled and chased on the surface, the pitch forming a support, which prevents the tools from pressing down more than is required. The pitch is afterwards melted and drained out, and a subsequent boiling in an alkaline lye completely cleans the work. Tea and coffee pots are the chief articles made in this manner.

REPRESENTA'TION, in Politics, the function of the delegate of a constituency in a legislative or other public assembly. The principle of representation, even where not directly recognised, must be presumed to have existed to some extent in all governments not purely democratic, in so far as the sense of the whole nation was considered to be spoken by a part, and the decisions of a part to be binding on the whole. The constitution of ecclesiastical councils, in which an express or implied representation is necessarily involved, doubtless conduced to the application of a similar principle to national assemblies; but it is in the exigences of feudalism that we trace the beginnings of an avowed and regulated system of political representation. The feudal superior who had to levy aid from his vassals, summoned a limited number of them to attend him, and confer regarding the required aid. The earliest complete system of representative institutions is to be found in the parliament of the Sicilies under the Swabian kings; but Britain is the only country in which a representative feudal assembly ripened into a legislative. As early as the reign of Henry III., we find the knights of the shire elected by the 'men of the country,' probably the king's military tenants, to consider, in the stead of each and all of them, what aid would be granted to the king for a proposed expedition into Gascony. Representatives of the burgesses were soon afterwards summoned, and were permanently ingrafted on parliament by Edward I. In Scotland, representative burgesses formed a part of the national assembly from the time of Robert Bruce's famous parliament at Cambuskenneth, in 1326; but down to a comparatively late period, the whole barons or freeholders of the country formed part of the king's council, and were entitled to attend in person. A system of representation among them was attempted to be introduced by James I. on his return from England, but became practically inoperative; and it was not till 1587 that the representatives of the small barons came to form part of the parliament. The progress of society has led to great changes in the constitution of the elective body, the most sweeping being those introduced by the Reform acts. See PARLIAMENT, and REFORM, PARLIAMENTARY.

An important question naturally arises connected with the subject of representation: Is the delegate the mere mouthpiece of his constituents, who must give effect to all their opinions and interests, or is it his duty to exercise his trust in the first instance for the general welfare of the nation? The former idea of representation was doubtless the earlier one; but it cannot be easily vindicated on any proper theory of government; and it is now the generally recognised doctrine among English statesmen, that a member of the House of Commons is bound to the entire nation by ties higher than those which bind him to his constituents, and that he ought to support such measures as he judges most beneficial to the country, even at the risk of prejudicing the immediate local interests of the body which sends him. It is therefore not very easy to reconcile with sound principles the usage which obtains so largely of demanding pledges from candidates for representation as to how they are to vote on every public question that is likely to come before them. Yet there is practically a difficulty in preventing a system of representation from becoming one of mere delegation, so long as the constitution gives to the electors the power of making their vote depend on any conditions which they may think fit to attach to it.

Most speculative politicians of the present day consider a representative government of some description as the best ideal type of government; but all repudiate the idea of an inborn right in all citizens to participate, and still more to participate equally, in the right of choosing the governing body. Any very extensive suffrage must of necessity lead to the predominance of mere numbers over intelligence, while a very limited suffrage has been objected to as doing away with the benefits which the community at large are presumed to draw from a participation in public functions. Several intelligent political writers, while advocating a widely extended suffrage, have proposed a graduation of that suffrage by giving to each individual a number of votes corresponding, as far as practicable, to his intelligence, property, or social position. This is doubtless the perfect ideal of representative

government, and the chief question is, By what test can the best approximate estimate of social value be arrived at? Two different schemes for this purpose have been proposed by Mr J. S. Mill and Professor Lorimer respectively—the former founded mainly on intelligence as indicated by instruction, and the latter on wealth and social position. The attention of political writers has also lately been directed to the question of the representation of minorities, who at present are not even allowed a hearing in representative assemblies. The most feasible scheme for this purpose is perhaps that of Mr Hare, which has the approval of Mr J. S. Mill, by which those who do not like the local candidates, are to be allowed to fill up voting papers by a selection from the names of any persons on the list of candidates, with whose general political principles they sympathise. This system, along with its other advantages, would, it is supposed, bring into parliament numerous men of able and independent thought, who, by the present system, refrain from offering themselves, as having no chance of being chosen by the majority of any existing constituency. See J. S. Mill's *Considerations on Representative Government* (London, 1861); Professor Lorimer's *Political Progress not necessarily Democratic* (1857); and Hare's *Treatise on the Election of Representatives* (1860).

REPRIE'VE (Fr. *reprendre*, to take back) is the suspension of punishment for a crime, and is used chiefly in connection with capital crimes. The power of suspending all sentences at any time is vested in the crown at discretion. There are also several grounds on which the judge or a court reprieves a sentence. One is, where the judge is not satisfied with the verdict, or is doubtful of the validity of the indictment, in which case he reprieves the sentence, in order to give time for some application to the crown. Moreover, an ordinary ground of reprieve is acted on generally as a matter of course, whenever the prisoner is a pregnant woman, and pleads that fact, in which case it is considered only merciful towards the offspring to put off the execution of the sentence until after her delivery. This was the law of ancient Rome; and nothing connected with the memory of Queen Mary is more detestable than the bloody proceeding in her reign of burning a pregnant woman in Guernsey, when the child, which was born at the stake, was cast into the fire as a young heretic. When a woman pleads her pregnancy as a reason for reprieve, the practice is for the judge to empanel a jury of 12 matrons, or discreet women, to inquire into the fact, and if they bring in a verdict of 'quick with child,' execution is stayed, as a matter of course, from session to session until the delivery. Another cause of reprieve is the insanity of the prisoner, for if before execution it appear the prisoner is insane, whether the insanity supervened after the crime or not, the judge ought to reprieve him.

REPRI'SAL is the retaking, from an enemy, goods which he has seized, or the capture from him of other goods, as an equivalent for the damage he has wrought.—A *reprise* is a ship recaptured from an enemy or pirate. If recaptured within 24 hours of the hostile seizure, she must be wholly restored to her owners; if later, she becomes the lawful prize of her recaptors.

REPRISALS, LETTERS OF, the same as LETTERS OF MARQUE (q. v.).

REPRODU'CTION, or the propagation of organised beings in the animal kingdom, is accomplished by three different processes. The first of the three processes by which the multiplication of individuals takes place consists in the division of one organism into two, each of these, again, dividing into two others, and so on. This is termed *reproduction by fission*. The second mode of increase consists in the formation of a bud at some part of the body of the animal. This bud gradually approximates in form to that of the parent from which it springs; its pedicle or stem gradually disappears; and the liberated bud ultimately assumes a perfect form, resembling in all respects the parent from which it sprung (*gemmation*). The third mode is far the most complicated. In it the new organism results from a series of changes occurring in an impregnated egg or *ovum*. For this process, distinct sexual organs, both male and female (which, however, may be associated in the same individual, although in all the higher animals they occur in distinct individuals), are required; a female organ for the production of cells termed 'germs,' and a male organ for the production of certain cells termed 'spermatozoa.' It is from the union (either within or without the body) and the mutual action of these cells—the germ and the spermatozoon—that the impregnated ovum results. The new resulting body is altogether different from either of the cells which took part in its production. This is the ordinary form of reproduction in all the higher animals, and may be termed *true generation*, in contradistinction to the previous forms of *reproduction by multiplication*. The terms *Digenesis* and *Heterogenesis* have been applied by recent physiological writers to designate the form of reproduction in which the contact of germs and spermatozoa gives rise to fecundation; while the terms *Monogenesis* and *Homogenesis* have been similarly applied to the cases in which non-sexual reproduction takes place by fission or gemmation.

Fissiparous multiplication is best illustrated by a reference to the Infusoria. It may be either longitudinal, as commonly occurs in *Vorticella;* or transverse, as occurs in *Stentor;* or indifferently longitudinal or transverse, as in *Chilodon*, *Paramecium*, &c. The joints of tape-worms multiply in this manner, and when sufficiently developed, become free. Amongst some of the Annelids, or true worms, reproduction of this kind in a somewhat modified form is also observed. This was first noticed in a *Nais* by the Danish naturalist Müller, by whom it was regarded as a rare and accidental occurrence. The more recent researches of De Quatrefages and Milne-Edwards have, however, shewn that the process is one of far more significance than Müller supposed. In the genus *Syllis*, De Quatrefages noticed the following appearances: When one of these worms is about to reproduce itself by fission, a number of rings become developed at its posterior extremity, and there is a notch or groove between the first of these rings and the part in front of it. The first ring soon becomes organised into a head provided with eyes and antennæ. The two annelids, parent and offspring, continue, however, to be united by the skin and intestine in such a manner that the latter animal lives solely upon the food swallowed by the former. During this period, each possesses independent life, for a struggle may often be observed between the two, each wishing to go its

Fig. 1.—Longitudinal Fission of Vorticella.

own way. After the lapse of a certain time, the body of the offspring becomes distended with ova in some cases, and with spermatozoa in others, while neither of these structures is to be seen in the body of the primary animal. Complete division is at length effected, and the offspring is free. In a few days, however, their bodies burst, from the distension caused by their contents. Ova and spermatozoa are thus diffused through the water, and fecundation thus takes place. In the genus *Myrianida* (*Autolytus*, according to Grube's classification), Milne-Edwards has seen no less than six new individuals (instead of a single one, as in *Syllis*) formed in gradual succession, one before the other, between the two terminal segments of the original body. Each of these new individuals, as it arrived at maturity, and acquired the external form (in reduced dimensions) of the parents, was found to be possessed of reproductive organs, of which the original animal

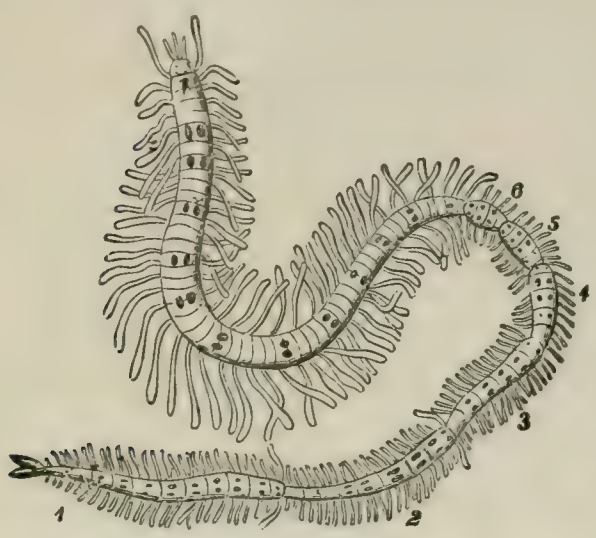


Fig. 2.—*Myriana*, with six new individuals formed on it.

was totally devoid. The youngest and smallest individual is the most remote from the tail.

In these instances, multiplication by division occurs as a *natural* process, but there are many cases in which *artificial* division gives rise to multiplication. Bonnet having found that a certain kind of small worm, when cut in two, reproduced a tail at the cut extremity of the cephalic half, and formed a head upon the caudal half, increased the number of sections, and finally succeeded in dividing one worm into twenty-six parts, almost all of which acquired a head and tail, and thus became distinct individuals. Corresponding results may be obtained by dividing a planaria or actinia into many segments.

Reproduction by gemmation is a phenomenon of very frequent occurrence in the lower departments of the animal kingdom. In the lowest of the animal subkingdoms, the PROTOZOA, it occurs in the *Rhizopoda*—viz., in the *Foraminifera;* in the *Spongiæ*, being probably the most common form of reproduction in sponges; and in the *Infusoria*, as, for example, in *Vorticella*. In the CŒLENTERATA, it is of almost general occurrence in the classes *Hydrozoa* and *Actinozoa;* and in the MOLLUSCOIDS it occurs in *Polyzoa* and in *Tunicata*. In the accompanying figure (fig. 3), the process is shewn as it occurs in the freshwater hydra (the type of the *Hydrozoa*) and in Vorticella. If some hydras are kept for a few days in a glass of their native water, knot-like excrescences will be seen on their bodies. These are the buds or *gemmæ*, which rapidly enlarge, and each by degrees assumes the appearance of a young hydra, tentacles appearing about the mouth, just as in the original animal. For some time, a portion of the food (minute infusoria, entomostraca, &c.), caught and digested by the parent, passes into the body of the offspring;

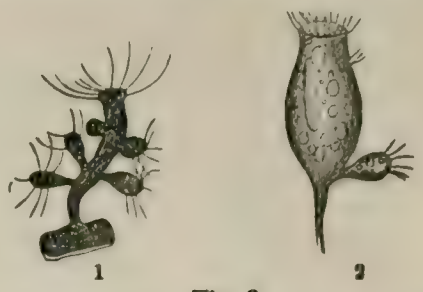

Fig. 3.

1, Gemmation in Fresh-water Hydra; 2, Gemmation in Vorticella.

but when the tentacles are sufficiently developed, the young polype catches food for itself, and when it is sufficiently matured to commence an independent existence, the connecting pedicle gives way, and the young animal is free and independent.

It must be distinctly understood, that the fact of an organism reproducing itself by fission or gemmation does not by any means exclude the possibility that it may also be reproduced by fecundated ova. That this is the case, is indeed shewn in the instance of the worm *Myriana*, and a very large number of corroborative cases might be readily given.

In *true generation*, two special organs are required—a female organ for producing the germ-cell or ovum, and a male organ for producing the sperm-cell or spermatozoon; and each form of generative apparatus consists of two parts, of which one is a formative organ—in the female, termed an *ovarium*, or ovary, and in the male, a *testis*—in which the reproductive cells are formed, and which is essential; and an efferent duct, by which the products of secretion are carried off. The male and female organs may exist in separate individuals, or they may co-exist in the same individual, giving rise to the condition known as *Hermaphroditism* (q. v.). The former condition is termed *bisexual* or *dicecious*, and the latter *unisexual* or *monœcious*. For a general description of the changes which take place in the impregnated egg, the reader is referred to the article DEVELOPMENT OF THE OVUM.

We shall conclude with a brief notice of the mode or modes of reproduction in the different classes of animals, beginning with the lowest.

In the subkingdom PROTOZOA, reproduction takes place by all three modes, viz., by fission, gemmation, and impregnated ova; but fission is here the predominating form; and it is only in the Infusoria that there is undoubted evidence of true generation by ova and spermatozoa. It is worthy of notice, that in the Infusoria, propagation is effected in no less than four different ways—viz., by the three processes already described in this article, and by a process known as 'encystation.' See INFUSORIA.

In the subkingdom CŒLENTERATA, it is found that both the Hydrozoa and the Anthozoa multiply by gemmation, by a true reproductive process, and in a few genera by fission.

In the ECHINODERMATA, fission has been observed in one class, the Holothuroidea, which, moreover, have distinct sexual organs combined in the same individual. In the other classes—the Echinoidea, Asteroidea, and Crinoidea—the sexes are separate, and generation only takes place by the union of germs or ova and spermatozoa.

In the ANNELIDA, true generation takes place, although, as has been already shewn, multiplication sometimes takes place by fission. In the lower *Mollusca* or *Molluscoids*, multiplication takes place

by gemmation and by true generation; while in the higher *Mollusca*, multiplication only takes place by true generation.

In the ARTICULATA—Insects, Crustaceans, &c.—distinct generative organs are always present, and, excepting in one class of Crustaceans—the Cirrhopoda—the sexes are distinct.

In the VERTEBRATA, we meet with the highest and most complex development of the generative function. In them, with a doubtful exception in the case of one or two genera of fishes, the sexes are always distinct.

The *osseous* and *cartilaginous* fishes present important differences in their reproductive organs and in their modes of reproduction. In the osseous fishes, the essential female organ—the ovary, or roe—consists of a large membranous bag, usually in two lobes, but sometimes single. When distended with ova, this organ fills the greater part of the abdominal cavity, and its lining membrane is arranged in folds, wherein the ova are formed and retained until sufficiently ripe for expulsion. They then escape into the abdominal cavity, and are expelled in almost incredible numbers through a special opening immediately behind the anus and in front of the urinary canal. As a general rule, the ova of fishes are impregnated after their expulsion; and in order that the impregnation of a sufficient number of eggs may be secured, the male secretion of fishes—the fluid containing the spermatozoa—is very abundant; the male secreting gland, which in fishes is termed 'the milt' or 'soft roe,' being equal in bulk to the ovary of the female. In a few instances, however, the young are hatched in the ovary, and grow to a considerable size before they are born, and in these cases—as, for example, in the viviparous blenny—impregnation must take place internally. In the cartilaginous fishes—as the sharks and rays—the generative organs are of a higher type. The eggs are here always impregnated within the body of the female, the male having special organs by which true sexual congress is effected, and the ovaries form two large racemous bunches, placed on either side of the spine. The eggs are large in size, and comparatively small in number; and as each egg escapes from the ovary, it is seized by a true oviduct, which furnishes it with additional protective coverings. About the middle of this tube 'there is a thick glandular mass, destined to secrete a horny shell, in which the yelk and white of the egg become incased. The egg, when completed, has somewhat the shape of a pillow-case, with the four corners lengthened out into long tendril-like cords, whereby the egg is entangled amongst the seaweed at the bottom of the ocean. A brittle egg-shell would soon be destroyed by the beating of the waves; hence the necessity for the corneous nature of the envelope; and yet how is the feeble embryo to escape from such a tough and leather-like cradle? This has likewise been provided for. The egg remains permanently open at one extremity; the slightest pressure from within, therefore, separates the valvular lips of the opening, and no sooner has the little shark thus extricated itself from its confinement, than the two sides close so accurately, that the fissure is imperceptible.'—R. Jones's *General Outline of the Animal Kingdom*, 1841, p. 534.

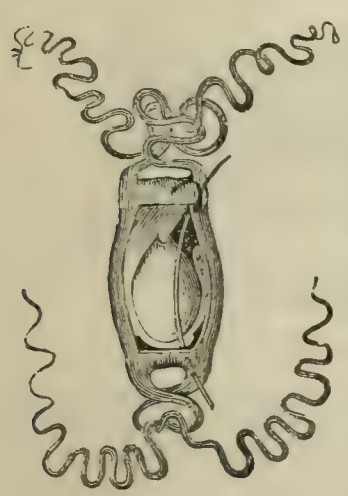

Fig. 4.—The Egg of Cartilaginous Fish, opened so as to shew the young animal.

In the *Amphibia* or *Batrachia*, the sexes are more closely associated than in the osseous fishes, the ova being generally impregnated by the male as they escape from the abdominal cavity of the female. The mode of reproduction of one amphibian, the Surinam Toad, is remarkable and anomalous. See PIPA.

In the true *Reptiles*, the male sexual organs become more perfect, instruments being given to facilitate the impregnation of the female during that congress of the sexes which now becomes essential to fecundation.

In *Birds*, the generative organs present a close analogy to those of the higher reptiles. There is only a single ovary (the left) that has a bunch-like or racemous appearance; the right, with its oviduct, being always atrophied or rudimentary—a remarkable violation of symmetry, resembling that which occurs in the lungs of serpents. As prolonged utero-gestation would be incompatible with flight, incubation here attains its highest perfection.

In *Mammals*, a new organ for the first time appears, from which that important class derives its name. In most of them (see MAMMALIA and PLACENTA), a temporary organ, termed the Placenta, is also formed, by which the fœtus is nourished during uterine existence.

For further details on the subject of this article, the reader is referred to De Quatrefages's *Rambles of a Naturalist*, and to his *Metamorphoses of Man and the Lower Animals;* Dr Allen Thomson's article 'Ovum' in the *Cyclopædia of Anatomy and Physiology;* Dr Carpenter's *Comparative Physiology;* and to Kölliker's *Entwickelungsgeschichte des Menschen und der höherer Thiere.*

REPRODUCTION IN PLANTS. See PLANT, VEGETABLE PHYSIOLOGY, and FECUNDATION.

RE'PTILES (Lat. *repo*, I creep), constitute a class of the subkingdom *Vertebrata*, lying between the classes of Amphibians and Birds. They may be briefly characterised as being cold-blooded, having a heart composed of only three cavities—viz., two auricles and a single ventricle, and as breathing by lungs throughout the whole period of their existence; in which respect they differ from the Amphibians, which some zoologists associate with them, and which, in the early part of their existence, are furnished with gills for aquatic respiration. They are divided into the following orders: 1. *Ophidia*, or Serpents; 2. *Lacertilia*, or Lizards; 3. *Rhynchocephalia;* 4. *Chelonia*, or Tortoises, and 5. *Crocodilia*, or Crocodiles; so that, in so far as external form is concerned, the members of this class present a far greater diversity than is observed amongst the members of the other classes of vertebrates.

With the exception of the tortoises, the reptiles in general are of an elongated form, the body being often nearly cylindrical, and usually terminating in a very long tail. In a considerable number (as the serpents and some of the lizards) no traces of limbs are apparent; in some (as certain lizards), the limbs are rudimentary; while in the remainder the limbs are fully developed, although not to the extent to which development takes place in birds or quadrupeds, as the feet rarely suffice to keep the belly from the ground. The outer covering of the body presents several well-marked varieties. In a few of the lizards, the skin is covered with regular scales, composed of a mixture of bony and horny matter, and lying over each other like those of fishes; in most

lizards and in serpents, there are scales and plates

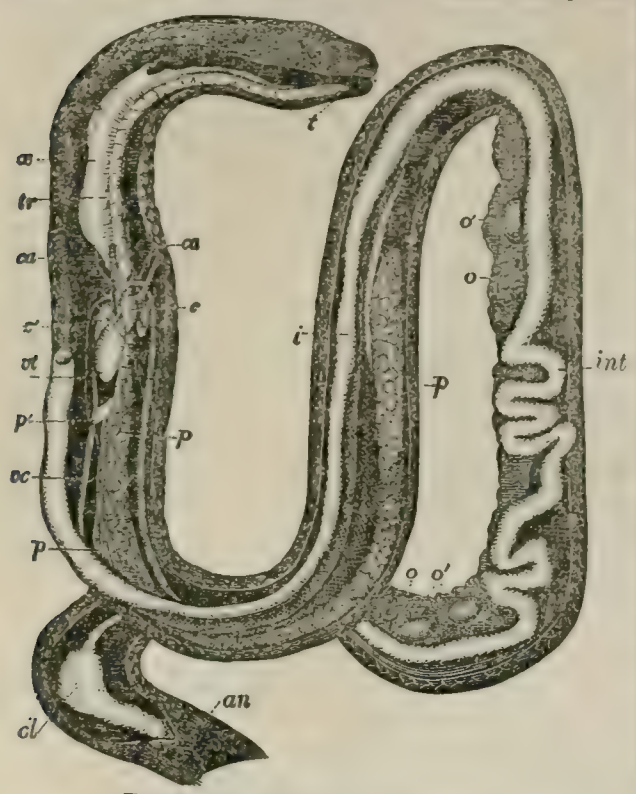

Fig. 1.—Anatomy of a Serpent:

t, tongue and glottis; *æ*, œsophagus (partly removed, to shew heart, &c.); *tr*, trachea; *ca*, *ca*, carotid arteries; *c*, left auricle; *c'*, right auricle; *vt*, ventricle of heart; *vc*, vena cava inferior; *p*, *p*, principal lung; *p'*, rudimentary lung; *i*, stomach; *int*, intestines; *cl*, cloaca; *an*, anus; *o*, ovary; *o'o'*, ova.

developed on the surface of the corium or true skin,

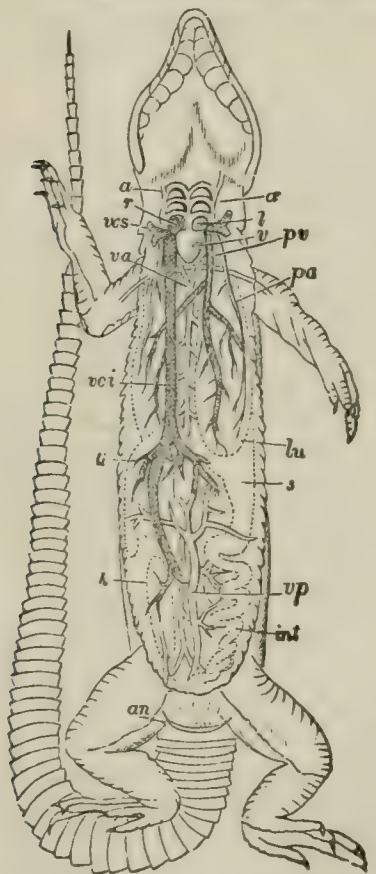

Fig. 2.—Anatomy of Lizard:

a, *a'*, arches of the aorta; *r*, right auricle; *l*, left auricle; *v*, ventricle; *vcs*, vena cava superior; *vci*, vena cava inferior; *va*, ventral aorta; *pv*, pulmonary veins; *pa*, pulmonary arteries; *lu*, lung; *li*, liver and hepatic vein; *k*, kidneys and renal vessels; *vp*, vena portæ; *s*, stomach; *int*, intestines; *an*, anus.

and covered over with epidermis, which is thrown off at intervals, the moult forming an accurate cast of the body of the animal; while in the crocodiles and tortoises the scales are converted into true bony plates, which in the former are embedded in the tissue of the skin, and in the latter are united with the ribs, sternum, &c., of the internal skeleton, to form the complete bony case into which the head and limbs of the animal can be retracted.

The skeleton is completely ossified in all reptiles, and presents many points of interest to the philosophical anatomist, into which we have not space to enter. In the skeleton of the crocodiles and lizards, there is an obvious distinction of the regions of the neck, trunk, and tail. The total number of vertebræ is often great, but it is chiefly in the caudal region that the excess occurs; there being 36 caudal vertebræ in the crocodile, and 115 in the monster lizard. In the serpents, the vertebral column is more abundantly subdivided than in any other animal; the number of vertebræ in the python being 422, of which about six-sevenths possess ribs articulated to their bodies by a ball-and-socket joint. By the motion which is thus allowed to the ribs, they become in some degree instruments of progression. In the reptiles generally (excepting the tortoises), one surface of each centrum (or body) of the vertebræ is concave and the other convex; while in the tortoises these surfaces are flat. The true skull is small, the bulk of the head being made up by the jawbones. As the sutures separating the individual bones never become obliterated, the reptilian skull

Fig. 3.—Skull of Crocodile.

is well adapted to illustrate the true structure of the vertebral skeleton. In fig. 3, we have the skull of the crocodile; in fig. 4, that of a serpent; and in

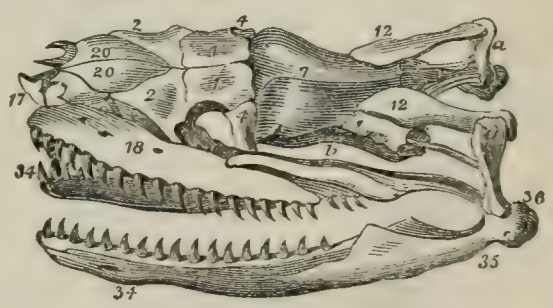

Fig. 4.—Skull of Serpent.

both, the corresponding bones are indicated by the same references. 1 is the *principal frontal*, divided in the serpent into two parts; 2, 2 are the *anterior*, and 4, 4 the *posterior frontals*; 7 is the *parietal bone*, which is usually single in reptiles; 12, 12 are the *mastoid bones* (homologous to the mastoid process in man); 17, 17 are the *intermaxillaries*; 18, 18 are the *maxillaries*; 20, 20 are the *nasals*; 23 is the *temporal bone* (corresponding to the squamous portion of the human bone); 34, 35, 36, 37 are the *dental*, the *articular*, the *angular*, and the *opercular*, portions of the *inferior maxilla*, or lower jaw; *a* is the *tympanic bone*, which supports the drum of the ear; *b* is the *zygomatic* or *malar*

bone; and *c*, *c* the *lachrymals*. The lower jaw (except in the tortoises) presents the peculiarity of being composed of a number of separate pieces; there being four or five in each half-jaw in serpents, while in crocodiles and lizards each half is divided into at least five, and generally six pieces, which are united by suture. The four most important of these are shewn in fig. 3. The purpose of this arrangement is probably (as Dr Buckland suggested in his *Bridgewater Treatise*) to diminish the risk of fracture, which would otherwise attend the snapping together of their elongated jaws.

The bones of the extremities, except in the serpents, which have no limbs, correspond with those occurring in the higher vertebrata.

The mouth, except in the Chelonians, is usually provided with conical teeth, adapted rather for seizing and holding prey, than for dividing and masticating food. These teeth, like those of fishes, are successional; that is to say, new teeth are being constantly developed, whilst the older ones are regularly shed. In the crocodiles, three, or even four generations of teeth, sheathed one within the other, may often be seen in the same socket. In some instances, the teeth are attached solely to the jaws, while in others they are also attached to the pterygoid or palate bones. In Chelonians, the teeth are replaced by a horny beak, which, according to the habits of the animal, is adapted for bruising as well as cutting, and which in some species constitutes a somewhat formidable weapon.

The digestive organs present less marked differences than the osseous system. With the exception of certain families of each order, all reptiles are carnivorous, and swallow their prey whole. Hence the jaws are adapted, by their mobility and subdivision into segments, to open very widely, and the œsophagus is capable of great dilatation. The tongue is commonly free, elongated, and bifid, except in the crocodiles, in which it is immovable; whence the popular idea that these animals do not possess this organ. The stomach is sometimes scarcely larger than the œsophagus and intestines (as in serpents), while in other cases it forms a sac of considerable size. In either case, it is capable of great dilatation. A liver, pancreas, and spleen are always present, the two former glands pouring their secretions into the upper part of the intestine, which is short, wide, and not much twisted, and divided into two portions, corresponding to the small and large intestines of mammals, by a valve. It finally terminates in a wide cloaca, into which the ducts of the urinary and generative organs usually open. The anal aperture of this cloaca is *transverse* in serpents and lizards, and *longitudinal* in crocodiles and tortoises. These peculiarities in the anal aperture are accompanied by remarkable differences in the external generative organs of the male, and seem to divide the class into two great sections.

It is in their circulating and respiratory organs that reptiles present the most marked characteristics. Like birds and mammals, they breathe air, but like fishes, they are cold-blooded. The reason why they are unable to sustain a fixed temperature above and independent of that of the surrounding medium, is due partly to the arrangement of the blood-vessels (see CIRCULATION), and partly to the structure of the lungs. The lungs are usually of large size; but as they are not subdivided, as in mammals and birds, into innumerable microscopic air-cells, the real aërating surface is comparatively small. In several orders, they are merely capacious bags, whose vascular or aërating surface is but slightly increased by sacculi developed in their cells. In serpents, the pulmonary arrangement is singular, one lung (usually the right one) being of extraordinary length, while the other remains altogether rudimentary. It is in the tortoises and crocodiles that the lung is most highly developed; but if the reader will compare the accompanying figure of the lung of the turtle with a section of any mammalian lung, he

Fig. 5.—Section of the Lung of the Turtle (reduced).

will at once perceive the striking difference. This inferiority of the respiratory apparatus of reptiles is further shewn in the absence of those means for the continuous introduction and expulsion of air which are observed in birds, and still more in mammals, and which are described in the article RESPIRATION.

The cerebral portion of the *nervous* system in many respects resembles that of fishes, but the cerebral hemispheres are larger in proportion to the optic lobes, while the cerebellum is usually smaller. The organs of the senses are better developed than in fishes. The eye is always present in reptiles, and presents no remarkable peculiarity. We here first meet with a special arrangement for the protection of this delicate organ; 'for while in serpents the skin of the head passes continuously in front of the eyes, merely becoming transparent where it covers the cornea, it is doubled in most other reptiles into two folds, constituting the upper and lower eyelids, which can be drawn together by a sphincter muscle; and we also find a rudiment of a third eyelid, formed by an additional fold of membrane at the inner angle, which is so completely developed in crocodiles as to form a nictitating membrane, that can be drawn completely across the eye, as in birds, by a muscle specially adapted for that purpose.'—Carpenter's *General and Comparative Physiology*, 3d ed. p. 495. The organ of hearing is more highly developed than in fishes or amphibia. There is no external auditory canal, the membrane

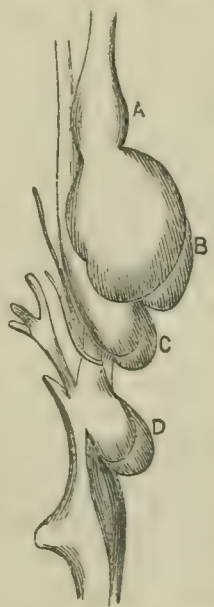

Fig. 6.—Brain of Turtle:
A, olfactive ganglia; B, cerebral hemispheres; C, optic ganglia; D, cerebellum.

of the tympanum being covered externally by the integument of the head. The senses of taste and touch are probably obtuse in most animals of this class, and from its structure, the tongue is probably rather an organ of touch than of true taste.

All reptiles are *oviparous* animals. Certain species, however, retain their ova in a sort of uterine cavity, formed by a dilatation of the oviduct near its termination in the cloaca, until the development of the embryo is so far advanced that the enveloping membrane bursts previously to the expulsion of the ovum, so that the young are actually born alive—a mode of generation to which the term *ovo-viviparous* is applied. The eggs are relatively large, and are furnished with a very large yelk, for the nutrition of the young animal. They are enclosed in a parchment-like shell, which contains very little calcareous matter. They are usually deposited in warm sandy places, well exposed to the sun, or in dunghills, in which the heat induced by the putrefactive process facilitates the final stage of embryonic development. Lizards lay from 8 to 12 eggs, serpents from 10 to 50, tortoises from 20 to 26, and crocodiles from 20 to 60. In this respect they differ widely from the amphibia, some of which lay as many as 1200 eggs. The common opinion that, after the expulsion of the eggs, the reptiles take no further care of their progeny, is erroneous. Crocodiles and lizards have been observed to watch the places which they have chosen as their nest; and the pythons (at all events, when in captivity) coil themselves around their eggs, and keep up a temperature very considerably above that of the surrounding medium. The sexes are always separate; and the male generative organs, which are far more highly developed than in amphibians, present peculiarities which, in association with the position of the anal aperture, have been adopted by zoologists as a basis of classification.

In relation to their *habitat*, it may be observed that most of the tortoises and certain serpents are essentially aquatic animals (some inhabiting fresh, and some salt water), which rarely seek the land except for the purpose of laying their eggs. Serpents, however, as a general rule, affect moist places in the neighbourhood of water, although some are inhabitants of dry sandy deserts. Lizards for the most part frequent the sandy districts of hot and tropical regions, and either burrow in the ground or live in holes in trees, walls, &c. Reptiles generally predominate in the warmer regions of the globe, in which alone the largest kinds are to be found. In the northern countries, comparatively few species are found, and these pass a great portion of the year in a state of Hybernation (q. v.) or torpidity. Dr Carpenter puts down 2000 as about the probable number of existing species of reptiles. Schinz states that in Europe there are 7 tortoises, 33 serpents, and 35 lizards. The most complete treatise on the natural history of reptiles is that of M.M. Dumeril and Bibron, in 9 volumes; it is entitled *Erpétologie Générale, ou Hist. Nat. Complète des Reptiles* (Paris, 1834—1854).

REPU'BLIC (Lat. *res publica*, the public good), a political community in which the sovereign power is lodged, not in a hereditary chief, but either in certain privileged members of the community, or in the whole community. According to the constitution of the governing body, a republic may therefore vary from the most exclusive oligarchy to a pure democracy. The several republics of Greece, and that of Rome were, at the outset at least, aristocratic communities. The medieval republics of Venice, Genoa, and the other Italian towns were also more or less aristocratic. The sovereign power was held to be vested in the franchised citizens, and every function—legislative, executive, or judicial—not exercised directly by that body, could only be exercised by parties deriving their authority from it. But the extent of the franchise, and the mode of exercising it, varied much in these civic communities; and the most prosperous and long-lived was Venice, which was also the most aristocratic of them all. In the 16th c., the Seven Provinces of the Netherlands, on their revolt from Spain, adopted a republican form of government, as did Switzerland on becoming independent of the German empire. Great Britain was nominally a republic for eleven years (from 1649 to 1660), and France for the same number of years after her first revolution (viz., from 1793 to 1805). The last French republic lasted only five years (from 1848 to 1853). Switzerland is now (1871), with the exception of the free towns of Lübeck, Bremen, and Hamburg, and the diminutive San Marino, the only republic in Europe. Since 1848, the constitution of Switzerland has been of a more democratic character than formerly.

The most important of modern republics is that of the United States of America — dating from its separation from Great Britain—where pure democracy has been tried on a scale unknown elsewhere. Mexico has been a republic since 1824, except during the rule of Maximilian in 1863—1867. Nine republics at present exist in South America — Peru, Chili, Paraguay, Bolivia, Colombia or New Granada, Venezuela, Ecuador, Uruguay, and the Argentine Confederation. In the republics of the ancient world, the franchised classes exercised their power directly without any system of delegation or representation. The same was at first the case in the Swiss cantons, where, however, representative government has been gradually introduced. Modern republics have been founded on the representative, not the direct, system, which can hardly exist except in a community that is very small and concentrated as to space. Switzerland and the United States of America are *federal* republics, consisting of a number of separate states bound together by a treaty, so as to present to the external world the appearance of one state with a central government, which has the power of enacting laws and issuing orders which are directly binding on the individual citizens.

REPU'BLICAN, a party name in American politics, which has had at different times different significations. At the adoption of the Federal Constitution in 1787, and while its ratification by the several states was under discussion, the country was divided into two parties—the Federalists, headed by Washington and the elder Adams; and the Anti-federalists (who afterwards took the name of Republicans), under the lead of Jefferson and Madison. The Federalists were in favour of a strong centralised government; the Republicans advocated the sovereignty of the States and the rights of the people; and finally secured those amendments and additions to the Constitution which were intended to guarantee state rights, and which declared that all powers not expressly granted to Congress by the Constitution, are retained by the States or the people. During the French Revolution and the wars which succeeded it, the Federal party sympathised with England, while the Republicans favoured the French; and being in power, under the presidency of Mr Madison, declared war against England in 1812, a measure which the Federalists violently opposed, going so far in the Hartford Convention as to threaten a dissolution of the union. During the political excitements of this period, when the excesses of the French revolution had

thrown a certain degree of odium upon its supporters, the Republicans were stigmatised by their opponents as Democrats. The name, given as a reproach, was soon adopted; and the party of Jefferson and Jackson called itself Democratic Republican, and its members were usually called Democrats; while the name of Federalist having become unpopular by the opposition of the party to the war with England, it adopted the designation of National Republicans, and some years later, of Whigs, which was the name taken by the 'disloyal' party in the War of Independence, the 'loyal' party being called Tories. The Whigs of 1840 repudiated alike the principles and name of the Federalists; they professed to be followers of Jefferson, and called themselves Democratic Whigs.

In the effort to elect Mr Fremont in 1856, and in the election of Mr Lincoln in 1860, the Whig party, deserted by many of its more conservative members, known as Old Whigs, but reinforced by a larger number of Free-soil Democrats and Abolitionists, adopted the name of Republicans, and were called by their opponents Black Republicans, from their anti-slavery tendencies. In the presidential contest of 1864, the Republicans, hoping to secure the support of the War or Union Democrats, adopted the name of the 'Union Party,' while they went further than the ancient Federalists in support of a strong centralised government. The Federalist, National Republican, Whig, and Republican party has been essentially the same, and for the most part a New England or Northern party—its principal leaders having been John Adams, Josiah Quincy, Alexander Hamilton, Daniel Webster, Henry Clay, Wm. H. Seward, and Abraham Lincoln. The Democratic party had its centres in Virginia and New York, and was the party of Jefferson, Madison, Jackson, Calhoun, Van Buren, Polk, Pierce, Buchanan. The former party advocated a construction of the Constitution favourable to the powers of the Federal government, a national bank, and a high protective tariff; the Democratic party, on the other hand, held to a strict construction of the Constitution, a careful limitation of the powers of the central government, an independent treasury, a specie currency, and free-trade, or a tariff for revenue only. There was, 25 years ago, a respectable Whig minority in most of the Southern States, and in two or three, Whig majorities; but when the Whig party adopted abolition, and took the name Republican, every southern state voted with the Democratic party.—Other party names met with in American political writings are of a local, factional, or temporary character. 'Blue-light Federalist' was a name given to those who were believed to have made friendly signals to British ships in the war of 1812. 'Clintonians' and 'Bucktails' were old factions of the Democratic party in New York. 'Barnburner' was applied as a term of reproach to a section of the democracy supposed to be in sympathy with the 'Anti-renters.' The 'Soft Shells' were 'Free-soil' Democrats, in favour of excluding slavery from the territories and future states of the Union; while the 'Hard Shells' were in favour of what they held to be the rights of the South. The more widely known name of 'Locofoco,' applied to, and good-naturedly accepted by the Democratic party, arose from the fact, that a meeting of a section of the party in Tammany Hall, its New York headquarters, having been deprived of light by the turning off of the gas, at the order of the party managers, lighted up the hall with candles, by the aid of lucifer or loco-foco matches, and so passed its resolutions. 'Copperhead,' the name of a venomous serpent, was applied to the peace party by the advocates of the war for the Union.

REPU'LSION, like Caloric, Luminous Corpuscles, and other crude hypotheses of medieval times appears to be doomed to speedy extinction. The apparent repulsion between the particles of a gas, in virtue of which it exerts pressure on the containing vessel, is now known to be due to motion (see HEAT). A wet cork and an oiled one, floating on water, repel each other—a phenomenon fully accounted for by capillary *attraction;* as is that of the apparent repulsion of mercury by glass, which is shewn to be due to the fact, that mercury attracts itself more than it attracts glass. No one now believes that a balloon rises while a stone falls, because the former is repelled, and the latter attracted, by the earth. The last is a very good example, because it clearly shews how apparent repulsion may be the result of attraction. The earth attracts the balloon *less* than it attracts an equal bulk of the medium (air) in which it floats; and, consequently, the pressure of the air on the balloon is more than sufficient to support its weight. The moon raises tides not only on the side of the earth nearest her, but also on that furthest from her. No one imagines that she attracts the nearer water, and repels the further. We know that she attracts the nearer water more, and the further less, than she attracts the earth; and that the apparent repulsion is thus merely a difference of attractions.

It is not quite so clear how we are to account generally for repulsion in Electricity (q. v.), Magnetism (q. v.), and Electro-magnetism (q. v.), though many of these phenomena are known (especially by the beautiful experimental researches of Faraday) to bear explanations precisely analogous to that of the balloon above alluded to. There are also very curious problems, apparently involving repulsion, connected with the behaviour of the tails of comets. But it is reasonable to suppose that, in all probability, we shall soon be able to account for all these phenomena by simple differences of attraction on the body influenced and the medium which surrounds it. Our real difficulty will thus be reduced to the explanation of attraction itself, which promises to be a problem of a far higher order of complexity. For an account of some of the modern speculations on this subject, see FORCE.

REPU'TE, in Scotch Law, is used sometimes as a technical term, which it is not in English law. Thus, a habit and repute thief is one who, as a matter of fact, is notoriously a thief. So habit and repute marriage is a marriage constituted between parties who have notoriously lived as man and wife, and are supposed by neighbours and friends to be married, though there never was a regular marriage.

REPU'TED O'WNERSHIP is a phrase used in the English Bankruptcy Law to denote that the bankrupt at the time of his bankruptcy was apparently the owner of goods in his possession. The general rule is, that whatever belonged to the bankrupt at that date goes to his assignees in bankruptcy, for the purposes of sale, and distribution of the proceeds among his creditors. But as a trader often has the goods of others in his possession with their consent, and thus has the appearance of a greater capital or stock than he possesses, and thereby obtains greater credit than he would otherwise do, it is provided by the Bankrupt Act that if the bankrupt at the date of his bankruptcy shall, with the consent of the true owner, have in his possession, order, or disposition any goods or chattels whereof he was the reputed owner, or whereof he had taken upon him the sale, alteration, or disposition as owner, the Bankruptcy Court shall have power to order the same to be sold and disposed of for the benefit of the creditors under the

bankruptcy. The object of this is to prevent deceit by a trader from the apparent possession of property to which he is not entitled; as it makes the real owners of goods who intrust them to a trader, careful, that they run the risk of the goods being seized for the general benefit of the creditors. Where, however, the articles in possession of the bankrupt are of that peculiar description that they are naturally calculated to excite an inquiry on the part of creditors as to whose they are, it is otherwise. Thus, pictures deposited with a bankrupt to take charge of, as they do not lead to any erroneous belief on the part of persons dealing with him, so they do not fall to be sold and divided as part of his assets. A similar doctrine exists in Scotland by the common law, and is therefore applied to other cases than bankruptcy. By the Mercantile Amendment Act, 19 and 20 Vict. c. 60, s. 1, in order to assimilate the law to that of England, it was declared that goods sold, but not delivered, shall not be attachable by the creditors of the seller, to the effect of preventing the purchaser or others from enforcing delivery of the same, and the right of the purchaser to demand delivery of such goods from and after the date of the sale, shall be attachable by the creditors of the purchaser.

REQUE'ÑA, a town of Spain, in the modern province of Cuenca, and about 80 miles south-east of the town of that name. It contains an industrious population, amounting to 10,500, who are employed in the manufacture of woollen, cotton, and silk fabrics.

REQUE'STS, COURT OF, an ancient court of equity in England, inferior to the Court of Chancery, and presided over by the Lord Privy Seal. It was abolished by 16 and 17 Char. I. c. 10. Also, a local tribunal (known likewise by the name of Court of Conscience) instituted in London by Henry VIII. for the recovery of small debts, with jurisdiction between citizens and freemen in questions of debt or damage under 40*s.*, afterwards extended to questions under £5. Similar local tribunals were instituted by act of parliament in other parts of the kingdom; but they have all been superseded by the county courts.

RE'QUIEM (Lat. *requies*, rest), a dirge or solemn service for the dead in the Roman Catholic Church. It consists in the celebration of the mass *Pro Fidelibus Defunctis* (For the Faithful Departed), the first words of the Introit of which are *Requiem æternam.*

RE'REDOS (Fr., behind the back), the wall at the back of an altar, seat, large fireplace, &c. In churches, the reredos is usually in the form of a screen detached from the east wall, and is invariably ornamented with niches, statues, &c., or with paintings or tapestry. Very fine examples exist at Durham, St Albans, &c.

RE'SCRIPTS (Lat. *rescripta*), answers of the popes and emperors to questions in jurisprudence officially propounded to them. *Rescripta principis* were one of the authoritative sources of the civil law, and consisted of the answers of the emperor to those who consulted him, either as public functionaries or as individuals, on questions of law. They were often applied for by private persons, more especially women and soldiers, to solve their doubts or grant them privileges. The rescripts directed to corporate and municipal bodies were known as *Pragmaticæ sanctiones*, a name which has found its way into the public law of Europe. See PRAGMATIC SANCTION. Rescripts might gradually come to have the force of law, in so far as their determinations in particular cases were of general application.

RE'SCUE, in English Law, is the illegal delivery and discharge of a prisoner or of goods out of the custody of the law. If, for example, a tenant whose goods are distrained for rent, take them by force from the bailiff, the distrainer has a right of action against the tenant or person who rescues the goods. When a prisoner is in custody for felony, and is rescued, the rescuer commits a felony. So the rescue of a prisoner for debt is an indictable offence, punishable by imprisonment for life, and forfeiture of lands and goods.

RESE'CTION or EXCISION OF JOINTS is an operation in which the diseased bone of a joint is cut out, in place of cutting off the whole limb. Dr Druitt, in his able summary on this subject in *The Surgeon's Vade-mecum*, remarks, that 'it seems to be established that excision is on the whole safer than amputation; less violence is done to the body, fewer great arteries and nerves are injured, and, what is of more consequence, fewer large veins are divided, and as the articular end of the bone only is sawn off, and the medullary canal not touched, there is less chance of pyæmia. Lastly, the patient is left with an imperfect limb, it is true, but with one which, in most cases, is highly useful.' The operation has been performed on the ankle-joint, the elbow, hip-joint, knee, and shoulder. Few subjects have in recent times excited more discussion among surgeons than the application of this operation to the knee-joint. The operation was first performed in 1762; and up to the year 1830, there are records of 19 cases, out of which 11 died. From 1830 to 1850, the operation was never performed, and was generally condemned; but in the last-named year it was revived by Professor Fergusson, and is now a frequent and regularly-recognised operation. 'The cases,' says Dr Druitt, 'in which it ought to be performed are, generally speaking, such cases of injury or disease as would otherwise be submitted to amputation. The *object* of the operation is to produce a firm and useful limb, slightly shortened, and with entire bony union or fibrous union, admitting of some small degree of motion at the situation of the joint. But all cases are not suitable for excision; and those cases are unsuitable and better adapted for amputation in which either the *quantity* of the diseased bone is very great (for then the case will probably not do well, or, if it proceed to recovery, and the patient be young, the future growth of the limb will be prevented), or the *quality* of the disease may be such as experience has shewn to be incompatible with the exudation of healthy material of repair.' In at least 50 per cent., the operation results in a good useful leg. It has already saved so many limbs that it must be regarded as one of the greatest triumphs of modern surgery.—Further information on this subject may be found in Professor Fergusson's *Lectures on Conservative Surgery*, delivered in 1864 at the Royal College of Surgeons, and reports in *The Lancet.*

RESEDA'CEÆ, a natural order of exogenous plants, mostly herbaceous; having alternate leaves; terminal spikes of hermaphrodite irregular flowers; the calyx of 4—7 unequal segments; the corolla of 4—7 petals, alternate with the segments of the calyx, the lower petals entire, the upper much cut; the stamens 10—30, inserted on a fleshy receptacle; the germen free, one-celled; the fruit a many-seeded capsule, three-horned, and often open at the apex, so as to expose the seeds, which are kidney-shaped. There are about forty known species, mostly natives of Europe and the west of Asia, and mostly mere weeds. Weld (q. v.) and Mignonette (q. v.) are the species most worthy of notice.

RESERVA'TION is a term used in lease and also in grants of a less estate than the fee-simple. Thus, if A, the owner in fee-simple of real estate, grant a lease to B, a third party, he does not give away his whole interest, but merely part of it, and that part not given away is said to be reserved or excepted. The word reservation is, however, chiefly used in reference to rent, it being said that a landlord, on letting his land, reserves to himself a rent out of the premises, and he has certain well-known remedies for the recovery of such Rent (q. v.).

RESERVATION, MENTAL (Lat. *reservatio* or *restrictio mentalis*), the act of reserving or holding back some word or clause which is necessary to convey fully the meaning really intended by the speaker. It differs from equivocation (Lat. *equivocatio* or *amphibolia*) in this, that in the latter the words employed, although doubtful, and perhaps not fitted naturally to convey the real meaning of the speaker, are yet, absolutely speaking, and without the addition of any further word or clause, susceptible of that meaning. Thus, an example of an equivocation would be: 'I did not write this libel,' meaning, 'I did not perform the mechanical operation of *writing it with a pen*,' although I had really *composed* and issued it. A mental reservation might be involved in the same words, if one were to say: 'I did not write this libel,' mentally withholding the word 'to-day,' although he had written it 'yesterday,' or on some earlier day. Few questions in casuistry have excited more controversy, or have been the subject of fiercer recrimination, than that of the lawfulness of equivocation and mental reservation. In the celebrated *Letters* of Pascal (q. v.) against the Jesuits, it was one of the most prominent, and used as he employed it, the most effective topics; and Pascal's charges against the Jesuit casuistry of that day have been repeated in almost every popular controversy on the subject which has since arisen. There are several varieties of mental reservation, differing from each other, and all differing from equivocation under its several forms. But as regards the morality of the subject, all the forms of language calculated to deceive may be classed together, and may be treated according to the same common principles. Mental reservation is of two kinds, *purely mental* and *not purely mental*. By the former designation is meant a mental reservation which cannot be detected, whether in the words themselves, or in the circumstances in which they are spoken. Of this kind, would be the mental reservation implied if a person, on being asked if he had seen A. B. (whom he really had just seen *walking* by), were to reply: 'I have not seen him,' meaning '*riding on horseback*.' A 'not purely mental' reservation is that which, although not naturally implied or contained in the words, may nevertheless be inferred or suspected, either from them or the circumstances in which they are used. Of this kind would be the mental reservation of a servant, in giving the ordinary answer to a visitor's inquiry for his master: 'Not at home,' although his master were really in the house; or that of a confessor, who, in a country where the privileges of the secret of the confessional are known and admitted, on being asked whether a certain person had committed a crime, which the confessor knew from his confession that he had committed, should answer: 'I do not know,' meaning 'outside of the confessional.' And, in general, all such doubtful forms, whether of mental reservation or of equivocation, may be divided into *discoverable* and *undiscoverable*. Much, although certainly not all the odium which has been excited against the casuists for their teaching on this head, has arisen from the confusion of their views as to these two classes of mental reservation; and the witty ingenuity with which Pascal mixed up examples of both, and applied to one what was really said of the other, did far more to damage the theological reputation of his adversaries, as a school, than any of the genuine really objectionable decisions which he cited from the writings of individual divines. Mental reservation has formed a subject of discussion for Protestant as well as Catholic divines; but without entering into a detailed history of this curious branch of casuistry, we shall content ourselves with stating briefly the chief principles on which the decisions of the most approved writers, especially of the Roman Catholic School, are founded.

First, 'purely mental' reservations, and 'absolutely undiscoverable' equivocations, are held to be in all cases unlawful, such forms of speech being in truth lies; inasmuch as they have but one real sense, which is not the sense intended by the person who uses them, and hence can only serve to deceive. This doctrine is held by all sound Catholic casuists, and the contradictory doctrine is expressly condemned by Pope Innocent XI. (Propp. 26, 27). On the contrary, mental reservations 'not purely mental,' and 'discoverable' equivocations, are held to be not inconsistent with truth, and, in certain circumstances, when there is necessity or weighty reason for resorting to them, allowable. For the absolute admissibility of the expedient of mental reservation and of equivocation in such circumstances, casuists allege scriptural precedent from Genesis xx. 12, Matt. xi. 14, Acts xxiii. 6, and other passages; and the principles on which their use, in such case, is defended, are (1), that there is supposed to be in the circumstances justification, and even necessity, for not making known the whole truth; and (2) that the mental reservation in the case supposed does not amount to more than a mere *withholding the entire truth*, inasmuch as what is stated is absolutely true, and the real meaning of the speaker is absolutely *contained in it, and discoverable from it;* and the false construction put upon it by the hearer, although permitted through necessity or grave reason by the speaker, is not *positively* put forward by him. A historical example of such equivocation or reservation is in the well-known answer of St Athanasius to the question of the party who were in pursuit of him, and who, overtaking him, but not knowing his person, asked what way Athanasius had gone. '*He is not far off*,' replied Athanasius, and the party passed on in pursuit. A less easily discoverable equivocation is ascribed to St Francis of Assisi, who, when a gang of robbers in pursuit of a traveller asked him whether he had seen the traveller pass by, put his hand up the sleeve of his habit, and replied: 'He did not pass *this* way,' meaning, 'up his sleeve.' And an ordinary example of discoverable mental reservation is that of a person who, on being asked by one to whom he could not with safety give a refusal, whether he has any money, should reply: 'No,' meaning, 'none to lend to you.' In order, however, to justify the use of these devices of speech, casuists require that there shall be some grave and urgent reason on the speaker's part; as, for example, the necessity of keeping a state secret, or a secret of the confessional, or of a professional character, or even the confidence intrusted by a friend, or the ordinary and fitting privacy which is required for the comfort and security of domestic life, and of the peaceful intercourse of society; and that the concealed sense of the form of speech employed, although it may be *actually undiscovered*, and even unlikely to be discovered, may yet be, in all the circumstances, *really discoverable*. On these two leading theoretical principles, the majority of

casuists are agreed. But a wide field for practical discussion lies between them, in the variety of senses which may be attached to the phrases 'not purely mental' and 'discoverable;' and it is in the practical interpretation of these terms that some of the casuists have found scope for the introduction of the lax decisions which have brought odium upon casuistry. Much of this odium has fallen upon the Society of the Jesuits, to such a degree, that their name has been popularly associated with the worst forms of the practice of mental reservation. See JESUITS and PASCAL.—See Scavini, *Theologia Moralis*, ii. 23; Murray, *Theological Essays*, iv. 274, and foll.

RESERVA'TUM ECCLESIA'STICUM, a provision of the religious Peace of Westphalia, so very celebrated in German history, that a brief explanation seems necessary. By this clause of the Treaty of Westphalia (1549), it was enacted, that if the holder of any ecclesiastical dignity, or of any territorial jurisdiction or property annexed to such ecclesiastical dignity, should change his religion, the dignity, territorial jurisdiction, or property held by him, should not be thereby alienated from the church from which he seceded, but should be still 'reserved' for that church, and for the legitimate successors of the seceder. It was chiefly out of the disputes regarding the violations of the R. E., that the Thirty Years' War arose.

RESE'RVE, in Army affairs, has several meanings. First, in a battle, the reserve is a body of troops held somewhere in the rear, generally out of fire, and kept fresh, in order that they may interfere with decisive force at any point where yielding troops require support, or an advantage gained needs powerful following up. The *reserve* of ammunition is a magazine of warlike stores, situated between an army and its base of operations, sufficiently retired from the front to be safe from sudden raids of the enemy, and at the same time advanced enough to allow of the supply actually in the field being speedily replenished.

The reserve of a nation is that force upon which the national defence is thrown, when its regular armies have failed in securing its safety. This reserve may be the *levée en masse* of the whole adult male population, or it may consist of a smaller section of the people duly trained to arms. The latter is, of course, the preferable system, when the arms of scientific modern warfare are to be brought into action. In different countries, the reserves are organised on very different principles. In Great Britain, they comprise the army of reserve, the enrolled pensioners, both of which consist of old soldiers, the militia, yeomanry, volunteers, and trained constabulary. According to the returns for 1864, the strength of this reserve (omitting the constabulary) was as follows, all being trained men, and instantly available on emergency:

	Great Britain.	Ireland.	Total.
Army of Reserve (veterans), .	982	182	1,164
Enrolled Pensioners (veterans),	8,516	4,812	13,328
Militia—Artillery and Infantry,	75,283	27,184	109,986
" (Channel Islands), .	7,519		
Yeomanry Cavalry, . . .	14,268		14,268
Volunteers, ...	165,413		165,413
Total, ...	271,981	32,178	304,159

The army of reserve and enrolled pensioners could be forthwith raised to 35,000, or even 40,000 men, all fit for any sort of garrison-duty. The militia could be augmented to 140,000, the quotas from Scotland and Ireland being 30,000 below the maximum fixed by parliament. The militia, yeomanry, and volunteers are capable of taking the field in conjunction with regular troops.

The reserve of the British possessions abroad amounts nominally to 90,780 men, but the actually qualified combatants are probably far less numerous.

The reserve forces of the principal states of the world are variously composed, as in France, the national guard; in Prussia and other German states, the Landwehr, with, as a last resort, Landsturm, which amounts to a *levée en masse* of the population able to bear arms.

The *Army of Reserve* is a force governed by a series of regulations under authority of 30 and 31 Vict., c. 110 (1867). It is to be composed of 50,000 men, divided into two classes: Class I. numbers 20,000, who must be soldiers that have not served more than one term of enlistment, who engage for a term of five years, receiving £3 per annum bounty, and are liable when on permanent service to do duty in any part of the world. Class II. numbers 30,000, who must be soldiers that decline to take a second engagement, or are military or marine pensioners, and are liable only to service within the United Kingdom. They must not exceed the age of 45 years at the time of enrolment. They receive a bounty of £2 per annum, and the period of service varies according to the time that they have already been in the army or marines. The pay is on the scale of two shillings per day for privates up to three shillings and sixpence for the officers, and sixpence addition if called out in aid of the civil power.

Up to Jan. 1, 1870, only 1939 men had entered Class I., and only 3885 had been obtained for Class II. The men brought into the Army Reserve Force, by the act of 1867, are exclusively enrolled pensioners. The Army Reserve Force numbered on Jan. 1, 1870, only 20,467 men.

RESE'RVED LIST, in the Royal Navy, is a device for expediting the promotion of officers who are still of an age for active service. Under certain Orders in Council of 1851 and 1853, old officers of good service are selected for promotion to the next grade on the Reserved List. This forms a bar to any further promotion; and removes the officer from active employment, except in the remote contingency of the Active List being exhausted, when these 'reserved' officers would be liable to be called upon to serve. For all practical purposes, however, the Reserved List is a retired list. The officers placed on it obtain the half-pay of the rank to which they are promoted, and their removal gives vacancies for the promotion of younger and more efficient men. In 1864, there were on the Reserved List 113 flag-officers, 92 captains, 99 commanders, 278 lieutenants, 92 masters, 2 paymasters, and 1 secretary; in all, 677 officers, costing annually £132,760 for their half-pay.

RE'SERVOIR, a receptacle for storing water for any purpose, but chiefly for the supply of towns, for driving machinery, feeding canals, irrigation, or for some process of manufactures. Generally, every water-works' establishment, for the supply of a town, requires to construct one or more reservoirs for providing compensation to the mills situated on the stream, for the water that is abstracted from any of its feeders.

The most advantageous position for a store reservoir is that where there is a narrow gorge in a valley widening out upwards into a flat expanse, thereby enabling a comparatively small dam or embankment formed in the gorge, to impound a large body of water; but in many cases where there is no such choice, the embankment may require to be placed across a wide part of a valley which narrows as it descends, thereby requiring a great embankment, in proportion to the quantity of water impounded. Sometimes reservoirs have

to be formed on flattish ground affording no great natural facilities for storing water; and in such cases they may require to be embanked wholly or nearly round and round. Where a reservoir requires to be constructed on perfectly level ground, the excavation must be calculated to be exactly equal to the embanking. The worst possible situation for a store reservoir is on the slope of a hill.

In many cases, natural lakes are used as reservoirs, means being adopted for raising or lowering the surface of the water, the difference between the lowest and the highest level of the lake's surface, multiplied by its area, being the measure of the available storage. Instances of this occur in Loch Leven, Kinross-shire, for the supply of the mills on the river Leven; in Loch Katrine and Loch Vennachar, for the supply of the city of Glasgow, and for the compensation required by the millers on the river Teith, in consequence of the abstraction of the Loch Katrine water; and in many other similar cases both for the use of towns and for water-power.

The capacity of a reservoir necessary for making nearly the whole water of a district available for use, depends much on the climate. Where droughts are of long continuance, its capacity requires to be proportionally large, but generally in Great Britain a capacity of six or seven months' supply is reckoned sufficient.

As illustrative of the very different facilities afforded by different sites for storing water, an instance occurs of two reservoirs of the Edinburgh Water Company, whereof one with an

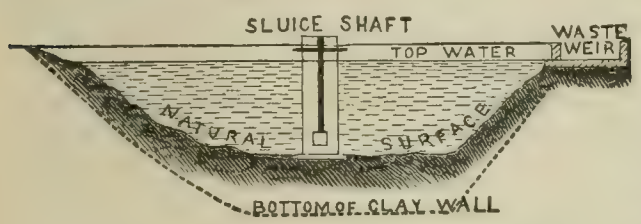

Fig. 1.—Elevation of Reservoir.

embankment containing 175,000 cubic yards of earthwork impounds only 17 millions of cubic feet of water; while another, with an embankment of 53,000 cubic yards, impounds 85 millions of cubic feet, there being a single embankment across a valley in both cases. Generally, the structure for

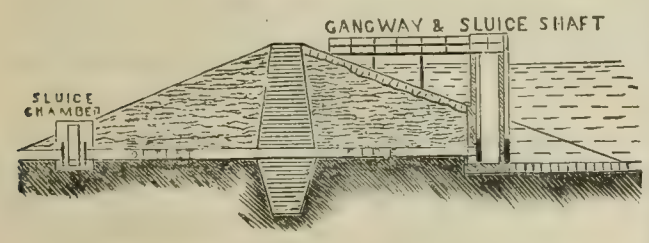

Fig. 2.—Transverse Section of Reservoir.

impounding water is an earthwork embankment, with a slope towards the water of 3 or 4 horizontal to 1 perpendicular, a breadth across the top of from 6 to 12 feet, the height being from 4 to 7 feet above the water, and an outside slope of from 2 to $2\frac{1}{2}$ horizontal to 1 perpendicular. The earthwork ought to be formed in thin layers well rammed, and to have a puddle-wall of good well-worked clay in the centre, the foundation of the puddle being a trench dug down to impervious rock or clay. The face towards the water requires to be protected by stones; and when a reservoir is large, those stones must be 'pitched'—i. e., regularly set by hand—so as to be able to resist the lash of the wave. In all cases, there is imperatively required a waste-weir, to allow flood-waters to escape without risk of overflowing the dam. It ought, if possible, to be placed on the solid ground; and if it can be cut through solid rock, that is best, and saves a great expense for masonry. The width of the waste-weir must be regulated by the catchment or extent of gathering-ground of the reservoir, and by the rainfall of the district; but for a given catchment and rainfall, a reservoir having a small area ought to have a larger waste-weir than one having a larger area, as the latter would allow flood-water to accumulate without rising to so high a level as it would in the former. Generally, however, from 12 to 20 feet of length of waste-weir may suffice for a square mile of catchment. In some cases, dams across gorges, for the purpose of forming reservoirs, are constructed of walls of heavy masonry, instead of earthwork embankments. Those across rivers for diverting the water into mill-lades, and for retaining the water which would otherwise be wasted at meal-hours, are generally constructed of stone, but sometimes of timber or iron.

The word dam is very often used incorrectly in Scotland to indicate a reservoir or sheet of water, instead of the structure made use of to form the reservoir, which is its proper meaning. A reservoir requires a sufficient outlet at the bottom by means of a tunnel, culvert, or iron pipes provided with suitable sluices, and these ought properly to be so arranged as that access can be had to them even when the reservoir is full.

Most of the disasters from the bursting of reservoirs have arisen from the want of sufficient waste-weirs, and from the embankment being overtopped in consequence by the water, and the outer slope being washed away, so as to deprive the puddle-wall of its support; but some accidents have occurred from the outlet being by a wooden box or trough through the embankment, and that being neglected and allowed to get rotten. The bursting of the Bilberry Reservoir, above Holmfirth, which occurred in 1852, arose from the embankment having sunk to, and being allowed to remain at, a level actually below that of the waste-weir, so that it was overtopped; but the Bradfield Reservoir embankment of the Sheffield Water-works which burst in 1864 gave way before the water had risen to the level of the waste-weir; and much difference of opinion exists as to the cause; some engineers contending that the disaster was caused by bad workmanship in the embankment itself, and others that it was owing to a landslip under the embankment.

Distributing reservoirs for towns, used chiefly for storing up the surplus water during the night, which otherwise might mostly go to waste, ought to hold at least half a day's supply, and ought to be placed high enough to command the highest parts of the town. They are generally built of masonry or brickwork, but are sometimes made of cast iron, and now occasionally of boiler-plate—in which last case they are best of circular form. There is one of that description on the highest part of Edinburgh Castle. In India and in the south of Europe, where long droughts prevail, very large reservoirs have been constructed for supplying water for the purpose of irrigation.

RESHD, one of the most industrious and extensively commercial towns in Persia, capital of the maritime province of Ghilan, stands on the Bay of Enzelli, a lagoon on the south-west shore of the Caspian Sea, 150 miles north-west of Teheran. It is in great part covered with trees, so that no accurate idea of its extent can be obtained by viewing it from any one point. The houses are all tiled and are neatly built, and the streets paved; water is supplied by an

aqueduct, and there are a palace, vast, gloomy, and ruinous; numerous caravanseras, large bazaars, and about 1200 shops and warehouses. Indian wares are imported from Balfrush, in Mazanderan, and European manufactures from Russian Armenia. Extensive manufactures of deservedly celebrated embroideries are carried on. Pop. 27,314. Enzelli, the port of R., on the Caspian Sea, is about 18 miles distant, and has 2500 inhabitants.—Eastwick's *Diplomate's Residence in Persia* (London, 1864).

RESI'DUARY LEGACY is a legacy of all that remains after the debts and legacies have been paid out of the estate of a deceased person. Debts must always be paid before legacies, and the next thing to be done is to pay all the express legacies; and as these seldom absorb the whole of the free assets, the residuary legacy is more or less valuable according as the express legacies are smaller than the free assets. If the express legacies swallow up all the funds, the residuary legacy is worth nothing.

RESI'NA, a town of Southern Italy, in the province of Naples, situated at the foot of Vesuvius, and facing the sea. Pop. 13,320. R. is built above the site of the ancient Herculaneum. Exquisite fruits are grown, and valuable wines made in the vicinity. It is surrounded by country-houses, and is a place of recreation for the Neapolitans, on account of its salubrity. The ascent of Mount Vesuvius is begun at Resina.

RE'SINS, a class of natural vegetable products composed of carbon, hydrogen, and oxygen. They are closely allied to the essential oils, all of which, when exposed to the air, absorb oxygen, and finally become converted into substances having the characters of resin; and in most cases, they are obtained from the plants which yield them, mixed with and dissolved in a corresponding essential oil. Like the natural oils, the natural resins are usually mixtures of two or more distinct resins, which admit of separation by their unequal solubility in different fluids.

The following are the general characters of this class of compounds. At ordinary temperatures, they are solid, translucent, and for the most part coloured, although some are colourless and transparent. Some are devoid of odour, while others give off an aromatic fragrance from the admixture of an essential oil. In their crude state, they never crystallise, but are amorphous and brittle, breaking with a conchoidal fracture; when pure, several of them may, however, be obtained in the crystalline form. They are readily melted by the action of heat, and are inflammable, burning with a white smoky flame. They are usually described as non-volatile, but it has been recently shewn that common resin may be distilled in a current of superheated steam. They are insoluble in water, but dissolve in alcohol, ether, and the essential and fixed oils. They are insulators or non-conductors of electricity, and become negatively electric by friction. Many of them possess acid properties, in which case their alcoholic solutions redden litmus. These resins combine with the alkalies, and form frothy soap-like solutions in alkaline lyes. The resinous soaps thus formed differ from ordinary soap in not being precipitated by chloride of sodium.

The resins are divisible into the *hard resins*, the *soft resins*, and the *gum resins*.—The hard resins are at ordinary temperatures solid and brittle; they are easily pulverised, and contain little or no essential oil. Under this head are included copal, the varieties of lac, mastic, and sandarach, and the resins of benzoin (commonly called gum-benzoin), jalap, guaiacum, &c.—The soft resins admit of being moulded by the hand, and some of them are viscous and semi-fluid, in which case they are termed *balsams*. They consist essentially of solutions of hard resins in essential oils, or admixtures of the two. They become oxidised and hardened by exposure to the air into the first class of resins. Under this head are placed turpentine, storax, balsam of copaiva, and the balsams of Canada, Peru, and Tolu.

The gum resins are the milky juices of certain plants solidified by exposure to the air. They consist of a mixture of resins and essential oils with a considerable proportion of gum; and on this account, when rubbed up with water, they yield a turbid or milky fluid from the dissolved gum, retaining the resin and oil in suspension, and are only partly soluble in alcohol. Some of them, as ammoniacum, asafœtida, euphorbium, galbanum, gamboge, myrrh, olibanum, &c., are valuable medicinal agents; while others, as caoutchouc (or india-rubber) and gutta percha, are of great value in the arts and in manufactures.

The resins are very widely diffused throughout the vegetable kingdom. But there are certain families of plants which are especially rich in them. They are generally obtained by making incisions into the wood of the trees which produce them; sometimes, however, they exude spontaneously, and in other cases require to be extracted from the wood by boiling alcohol. The crude resins are separated from the essential oils with which they are usually mixed, by distillation with water, the resin remaining while the oil and water pass off; and from the gummy and mucilaginous matters, by alcohol, which dissolves out the pure resins, which can be precipitated from their alcoholic solution by the addition of water.

The resins are extensively employed in medicine; and in addition to the almost innumerable applications of caoutchouc and gutta percha, various resins are of service in the preparation of varnishes, soaps, pigments, artificial light (resin-gas), &c.

Various fossil resins are known, of which the most important is amber. Some chemists place bitumen and asphalt amongst this class; and amongst the fossil resins described by mineralogists may be mentioned Fichtelite, Hartite, Idrialite, Ozokerite, Scheererite, Xyloretin, &c.

The common resin, or rosin, of commerce exudes in a semi-fluid state from several species of pine, especially *Pinus tæda*, *P. mitis*, *P. palustris*, and *P. rigida* of North America, *P. pinaster*, *P. pinea*, and *P. Laricio* of Southern Europe, and *P. sylvestris* of Northern Europe. The process of collecting it is

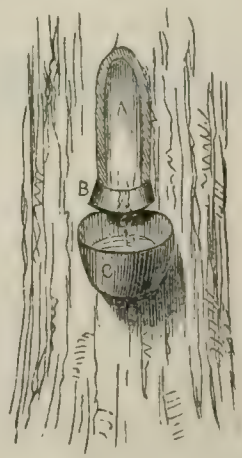

Fig. 1.

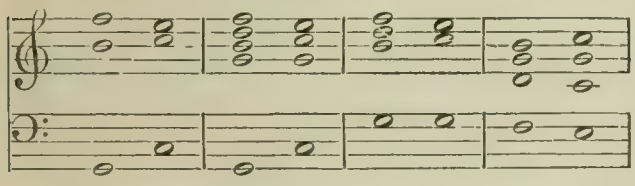
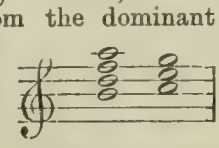
Fig. 2.

very simple: a longitudinal slice of the bark and wood (A, fig. 1), about a foot in length, is taken off



by means of an axe with a curved blade (fig. 2); and at the bottom of the groove thus made, a small piece of bent wood or thin metal, as tin or zinc, is driven into a curved cut, made by one blow of the axe (B, fig. 1); this forms a sort of spout, which catches the liquid resin as it runs from the wound, and guides it into a small pot, made of common clay burned. At certain periods, these pots are emptied, and their contents put into casks, for transport to the distilleries, where the volatile essential oil is removed from the resin. The resin thus procured is used very extensively in the manufacture of common yellow soap, for the production of oil or spirits of turpentine, and the preparation of ointments and plasters in pharmacy.

The other resins most generally known and used in Europe are Anime (q. v.), Copal (q. v.), Dammar (q. v.), Mastic (q. v.), Sandarach (q. v.), Frankincense (q. v.), Lac (q. v.). In addition to these, there are many which are of essential service in other countries, as the Piny Resin or Dhoop, obtained from *Vateria indica;* Black Dammar, obtained from *Canarium strictum;* Saul Resin, or Dammar Batu, from *Shorea robusta* – all of which serve many useful purposes in India, China, Japan, and other Asiatic countries. The forests of South America furnish many others.



RESI'STING A CONSTABLE is an offence punishable by justices of the peace in a summary manner.

RES JUDICA'TA, in Law, means that the subject-matter of an action has been already decided by a court of competent jurisdiction, and if so, a plea setting up the *res judicata* is a sufficient defence. In order to be binding, however, the suit in the former case must have been between the same parties.

RESOLU'TION, in Music. In the progression of chords in a musical composition, there are certain chords that require to be followed by certain others, or, as it is called, *resolved* into them, otherwise, a sense of incompleteness is left on the ear. Thus the chord of the dominant seventh must be resolved by the tonic harmony, the major third ascending a semitone to the key-note, and the seventh descending one degree to the third of the key:

The diminished triad is similarly resolved, and all chords immediately derived from the dominant harmony. The chord of the added ninth is resolved by descending a second to the fifth of the tonic:

RESOLUTION OF FORCES. See Composition.

RE'SOLUTIVE CLAUSE is the technical name given by the law of Scotland to a clause in a deed of entail, the object of which is to declare that if the heir of entail in possession do any of the things which he is expressly prohibited from doing, such as attempting to sell the estate, or alter the order of succession, his right to the estate shall cease, and the estate shall pass on to the next heir.

RESPE'CTING, or RESPECTANT, in Heraldry, a term used to describe two animals borne face to face. Beasts of prey rampant when so borne are, however, said to be *rampant combatant.*

RESPIRATION, Organs and Process of. The great objects of respiration or breathing are, first, the introduction into the system of oxygen, by which the products resulting from the disintegration or breaking up of the muscular, nervous, and other tissues of the body are converted into compounds, which are easily eliminated or removed by the excreting organs (as the kidneys, lungs, skin, &c.); and, secondly, the removal of the most noxious, and consequently, the most important of these products, carbonic acid, through special respiratory organs, which, in most air-breathing animals, except insects, are lungs; while in water-breathing animals, excepting those very low in the scale of organisation, they take the form of *branchiæ*, or gills. In all the vertebrated animals, excepting in fishes, and in the amphibians during their young state,* the respiratory organs are more or less complicated internal air-sacs, communicating through the throat with the external atmosphere. The simplest known form in which these Lungs or internal air-sacs exist is as a pair of elastic membranous bags placed close beneath the vertebral column, communicating with the surrounding atmosphere by a tube known as the windpipe, or *trachea*, which opens through the larynx, or organ of voice, into the throat. These bags are lined by a delicate, thin, and moist membrane, called a mucous membrane, embedded in, and partly beneath which is a vascular network, through which all the blood in the animal's body is in turn driven by the heart. The moist partition between the blood in this network and the air in the interior of the lungs is so thin, that after having (by its moisture) dissolved the oxygen of the air, it permits of its passage into the moving current of blood, whilst through the same agencies carbonic acid simultaneously passes in an opposite direction from the blood into the air. To complete the apparatus, there are certain muscles under whose action the bags are emptied of their vitiated contents, and refilled with pure air. Such are the respiratory organs as they occur in that remarkable animal, the *Proteus anguinus*, found in the dark caves of Carinthia, and belonging to the order *Proteida*, referred to in the foot-note. In the more highly organised animals and in man, we find these elementary essential parts complicated and modified in a great variety of ways. Confining our remarks for the present to the respiratory process as it occurs in man and mammals, we may consider the anatomical details under three different heads. *First*, There must be a special respiratory organ—the lungs—affording by its internal arrangement an immense extent of internal surface, covered by vascular network, through which the blood flows in innumerable minute streamlets, only separated by an extremely thin membrane from the atmospheric air that has been inhaled; *secondly*, There must be such an arrangement of the circulating system that fresh blood may be perpetually driven from the right side of the heart through the lungs, and onward to the left side of the heart; and *thirdly*, There must be arrangements for the frequent and regular change of the air contained in the lungs. These three points will be considered in the order in which we have placed them.

A sufficiently large internal aërating surface might of course be obtained by increasing the size of the air-bags themselves, but this would involve an increase of size in the animal. In examining the lungs of different animals, two plans are observed for increasing the internal surface without increasing the total bulk of the lungs.

* A few of the amphibians, such as the species of the genera *Proteus* and *Siren*, retain their branchiæ during their whole life; they are placed in the orders *Proteida* and *Trachystomata*, in consequence of peculiar characters of the skeleton.

According to one plan, the internal surface is, as it were, moulded into cells, separated laterally by partitions, somewhat like the cells as seen in a section of honeycomb, or more like the appearance presented by the second or honeycomb stomach of ruminating animals; according to the other, enormous multitudes of little lung-sacs partitioned, as will be presently shewn, in their interior, are clustered round the ultimate branch of a common air-tube, which communicates with all of them. If we can conceive a bunch of grapes with its stem and all its minute branches, and the grapes attached to the ends of these branches completely hollow, we get a good idea of this second plan, except in so far as the partitioning of the terminal cells (the grapes in the illustration) is concerned. By the former method, which occurs in amphibians and reptiles, the lung-sacs are merely rendered more cellular in their interior; whilst, by the latter plan, compound lungs are formed, such as occur in birds and mammals, including man. Hence these two varieties of lung-structure correspond to the so-called cold-blooded and warm-blooded animals respectively. In fig. 1, representing a section of the lungs of the frog (magnified), and in fig. 5 of the art. Reptiles, representing a section of the lungs of a turtle (diminished), we have illustrations of the first plan (the cellular lung-sac), while in figures 2 and 3 we have diagrammatic illustrations of the human lung. Figure 2 is a shaded diagram (copied from Mr Marshall's admirable series of *Physiological Diagrams*), to shew the ramifications of the air-tubes in the human lungs. L is an outline representing the left lung; T, the

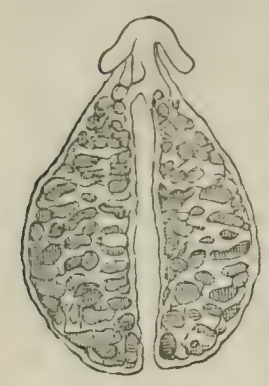


Fig. 1.

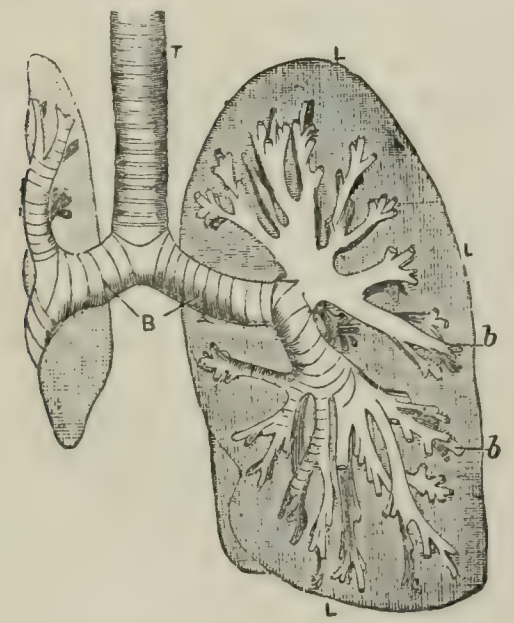

Fig. 2.

main air-tube, called the windpipe or *trachea* (so called from the Greek word *tracheia*, rough, and similarly termed in Latin the *Arteria aspera*, although not an artery, as we now employ the word), descends through the neck from the larynx or organ of voice into the chest; B shews the right and left *bronchi*, or primary divisions into which the windpipe separates, one for each lung. Each bronchus enters the lung at the so-called root, and divides and subdivides into smaller branches, which never coalesce, but continue separate, like the branches and twigs of a tree. These are the *bronchial tubes*, or the *bronchiæ* of some writers; the smallest shewn in this diagram, *b*, *b*, undergo many further subdivisions, until (to use Mr Marshall's own description) 'at length they form an immense number of minute tubes, not more than $\frac{1}{70}$th of an inch in diameter, each of which ends in a cluster of cells, or, as it may otherwise be described, opens into a small membranous sac, a little wider than itself, having a cellular internal surface very similar to that of the frog's lung, but of course on a microscopic scale.' In fig. 3. (also copied from Mr Marshall's diagrams), there is a representation, magnified about 100 diameters, of three of these clusters of cells, or little lung-sacs, from the human lung. In this figure, *b* is a small air-tube, or bronchial tube, from which several of the finest or ultimate tubes proceed; *c* shews the outer surface of one of the lung-sacs, or *lobules*, as they are commonly termed; *d*, the inner surface of another, which has been cut open, so as to shew the ultimate recesses of the lung to which the air has access—viz., the *air-cells*. According to Rossignol, the ultimate bronchial ramifications terminate in a shape resembling that of an inverted funnel, and hence he applies the term *infundibula* to these endings. In fig. 4 (copied from Rossignol's *Memoir*), there is a representation of the termination of an ultimate bronchial tube in the lung of a dog: *a* represents an ultimate tube, or lobular passage, branching towards the infundibula; *b* is the interior of one of the seven infundibula shewn in the figure; while *c* represents one of the numerous septa or partitions projecting inwards on the infundibular wall, and forming the air-cells. According to Todd and Bowman, the diameter of the lobular passages is from $\frac{1}{100}$th to $\frac{1}{200}$th of an inch, while that of the cells ranges from $\frac{1}{200}$th to $\frac{1}{300}$th of an inch. It is on the inner surface of these air-cells that the network of minute capillaries is spread in which the act of aëration takes place. Each lobule receives air through its own bronchial tube alone, and consequently there is no direct communication between the air-cells of adjacent lobules. These lobules are closely compressed upon one another; and collectively, together with the connective tissue which unites them to one another, make up the great mass of the lungs. To such an extent is the process of subdivision carried out, that, according to calculation, the lungs of an adult man contain at least 600 millions of these air-cells. It is in consequence of the air included in these cells that the pulmonary tissue has a soft spongy feel, and crackles when compressed between the fingers (see Respiratory Sounds); and for the same reason, the lungs, and even small portions of them, even after strong pressure, float in water, it being extremely difficult to drive all the air out of the cells. The lungs (except in the fœtal state, when no air enters them) are thus the lightest

Fig. 3.

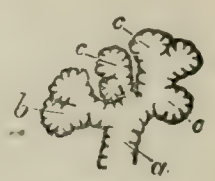

Fig. 4.

organs, in relation to their size, in the body. Although their bulk is so great that, with the heart, they occupy almost the whole of the cavity of the chest, they only weigh about three pounds and a half in men, and two pounds and three-quarters in women. Their colour varies at different ages. At birth, they are of a pinkish white tint; in adult life, they are of a slate colour, and present a mottled appearance; and in old age, they become of a still darker tint. The polygonal markings which are seen on the surface correspond to the outer surface of the lobules already noticed. Their shape is adapted to that of the cavity in which they are lodged, each lung being conical in form, with its apex rising into the neck; while its base, which is broad and concave, rests upon the convex surface of the diaphragm; and between the two lungs lie the heart and the great vessels that proceed from it. During life (except in certain diseases, as for instance, PERICARDITIS, q. v.), the inner margins of the lungs nearly overlap the heart, leaving only a roundish space, less than two inches in diameter, of that organ uncovered, while their lower borders extend to the cartilages of the ribs, and fit into the angle formed between those cartilages and the diaphragm. Each lung is invested by its own serous membrane, the PLEURA (q. v.), which serves the double purpose of facilitating the movements which the lungs undergo in the act of respiration, and of suspending each lung in its proper position. In the latter function, the pleuræ are essentially assisted by the great air-tubes and blood-vessels, which collectively form what are termed the roots of the lungs.

The structure of the air-tubes and the lungs themselves next requires consideration. Beginning with the upper portion, we have to consider the *trachea*, or windpipe, which in the human subject descends in the middle line from the Larynx (q. v.) to the level of the third dorsal vertebra, where it divides into the right and left bronchi (as seen in fig. 2). It is kept permanently open by from 16 to 20 cartilaginous rings, which surround two-thirds of the tube, and are incomplete behind, where the tube is completed by the same fibrous membrane which covers and unites the cartilages in front and on the sides. In this fibrous membrane are numerous tracheal glands (which probably furnish much of the vapour of the breath, and may occasion its odour), together with unstriped muscular fibre, to which the term *trachealis* muscle has been given. The trachea measures about 4½ inches in length, and is about three-quarters of an inch wide. Its mucous membrane is continuous through the glottis with that of the pharynx or throat, and is covered with ciliated columnar Epithelium (q. v.). Of the bronchi, the right is wider, shorter, and more horizontal than the left. Their walls are composed on the same plan as those of the trachea. Upon entering the lung, each bronchus divides in the method already described. The walls of these bronchial tubes become thinner as they approach the air-cells. The cartilaginous portions which, in the primary divisions of each bronchus, partially retained the annular form, become gradually reduced to mere flakes, and finally cease in tubes of $\frac{1}{8}$th or $\frac{1}{10}$th of an inch in diameter. The unstriped muscular fibres occurring in the trachea are continued downwards to the minutest tubes, forming a very thin layer, completely surrounding the canal, and the ciliated epithelium extends equally far. The terminal bronchial tube loses its epithelium and muscular coat at about one-eighth of an inch from the most distant air-cell to which it leads, and is thus reduced to a single coat, consisting of the basement membrane (see MUCOUS MEMBRANE), with yellow elastic fibres blended with it. Of this structure, the interlobular passages and the air-cells are composed.

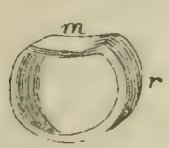

Fig. 5.—A separated Tracheal Ring.

r, representing the cartilaginous, and *m* the posterior flattened membraneous portion.

The mode in which the blood is perpetually changed in the lungs next demands consideration. The venous or impure blood collected from all parts of the body in the right side of the heart, is conveyed to the lungs by the pulmonary artery, which is about the size of the aorta, and, like that vessel, is furnished with three semilunar valves at its origin, which prevent the blood from regurgitating into the right ventricle of the Heart (see CIRCULATION). The pulmonary artery divides, before entering the lungs, into a right and a left branch, which ramify as far as the lobules in company with the bronchial tubes. At this point, they distribute themselves on the outside of the lobules, in the so-called *interlobular fissures*, and penetrating between the air-cells, form a capillary network on and in the walls of the cells and of the lobular passages. This network empties its blood, which is now aërated, into minute venous radicles, which converge to form larger veins, and these finally form the four pulmonary veins, which discharge their arterialised blood into the left side of the heart. The walls which support the capillary network of the lungs are (as Todd and Bowman observe) 'for the most part much too thin to enclose the capillaries between the two layers of their substance, and therefore the capillaries project fairly into the air cells by a great part of their circumference, being adherent to the wall by a narrow line only. The capillary wall is thus exposed and bare, in contact with the air of the cell, and nothing besides the delicate membrane of the capillary intervenes between the air and the blood. A capillary frequently passes through an aperture in the cell-wall, so as first to project into one cell, and further on into a contiguous one, but never becomes altogether free from the wall.'—*Phys. Anat.* v. ii. p. 393. The diameter of these capillaries is about $\frac{1}{1800}$th of an inch, which is comparatively large, and admits of the passage of blood freely; and the air and the blood may be said to be in contact, since they are only separated by a delicate capillary wall, less than $\frac{1}{20000}$th of an inch in thickness. If the rate of the blood in the capillaries be taken at an inch and three-quarters per minute (according to the estimate of Valentin, drawn from observation of the frog's foot), it has been calculated that the blood would at each circuit remain in contact with the air about one second and a half. In all probability, however, the motion of the blood is quicker in the pulmonary capillaries of man and other mammals and of birds than in those of the frog's foot.

In addition to the pulmonary artery and pulmonary veins, which convey the blood to and from the lungs for the purpose of aëration, there are other vessels, known as the bronchial vessels, for the nutrition of the lung itself, the distribution of which, and their mode of communication with the pulmonary vessels already described, have been subjects of much discussion; but into this we need not enter. The lungs are supplied with nerves from the anterior and posterior pulmonary plexuses, lying at the root of the organ, and composed of filaments of the pneumogastric and sympathetic nerves. The filaments from these plexuses

accompany the bronchial tubes, in which they are finally lost. The part which these nerves play in the respiratory process will be considered after we have described the *movements of respiration*, by which the air in the lungs is being perpetually changed.

For a description of the shape and framework of the chest, see CHEST. The chest (or thorax, as it is termed by anatomists) is so constructed as to be capable of enlargement in height (vertically), in depth (or from the front backwards), and in width (or from side to side). Its height is increased mainly by the descent of the diaphragm, and to a certain extent by the elevation of the ribs, and the widening of the intercostal spaces; while its depth and width are increased by the elevation of the ribs, which carry forward and elevate the breast-bone (or sternum), especially at its lowest end, and are slightly rotated on an imaginary axis, joining their extremities, by which their central portion is raised, and slightly removed from the mesial plane of the chest. It is only in forced or deep inspiration that all these means of enlarging the chest are called into play. An ordinary inspiration is attended in men with very slight elevation of the ribs (about one-twentieth of an inch), while in women the elevation is much greater, especially in the upper ribs; the cause of this difference in the sexes probably lying in the narrower waist of the female requiring a compensation in the upper part of the chest. MM. Beau and Maissiat describe three varieties of ordinary respiration—viz., 1. Abdominal, or that chiefly effected by the diaphragm, and seen in the motion of the walls of the belly; 2. Costo-inferior, or that in which the seven lower ribs are observed to act; and 3. Costo-superior, or that effected in a considerable degree by the upper ribs. The first variety occurs in infants up to the end of the third year, and in males generally; the second in boys after the age of three, and in men; and the third in adult females. The difference between the depth of a forced and an ordinary inspiration is shewn in the accompanying figures. Our limited space precludes a detailed notice of the various muscles which are concerned in respiration. The total power of the respiratory muscles has been measured by several physiologists, amongst whom Dr Hutchinson deserves special notice. He finds, as the average of 1500 experiments, that the power of expiration is nearly one-third stronger than that of inspiration, and he is of opinion that when the expiratory are not stronger than the inspiratory muscles, some disease is present. He tested the force of the two classes of respiratory muscles by causing persons to make the most powerful efforts of which they were capable, when breathing through the nose into an instrument termed a spirometer, and by this means he found that men of five feet seven or eight inches in height have the greatest inspiratory power, it being equal, on an average, to a column of mercury of 2·75 inches, while their expiratory power was equal to 3·97 inches. The following table is given by him as exhibiting the range through which these powers may vary within the limits of health:

Power of Inspiration.		Power of Expiration.
1·5 inches	Weak	2·0 inches
2·0 "	Ordinary	2·5 "
4·5 "	Remarkable	5·8 "
7·0 "	Very extraordinary	10 0 "

The co-operation of the resilience of the lungs and the elasticity of the walls of the chest with the expiratory muscular movement, is probably the cause why the expiratory power, as tested by the height of a column of mercury, is greater than the inspiratory power. Dr Hutchinson calculates that a man who raises three inches of mercury by an effort of inspiration exerts a force equal to 1000 lbs.; while the one remarkable case in which the mercury rose to seven inches, indicated a force of 2200 lbs., or nearly two tons.

The following points in connection with the respiratory movements require notice. Every complete act of respiration is divisible into four parts—viz., 1. Inspiration; 2. A short pause, not always observed; 3. Expiration; and 4. A considerable pause, occupying, according to Vierordt, about one-fifth of the whole time required for one complete respiratory act. The act of expiration is always more prolonged than that of inspiration, the former being to the latter in the ratio of 12 : 10 in adult males, and as 14 : 10 in children, women, and aged persons. The number of respiratory acts performed in a minute varies at different ages. According to Quetelet, at birth there are 44 respirations in one minute; at 5 years of age, 26; from 15 to 20, 20; from 20 to 25, 18·7; from 25 to 30, 16; from 30 to 50, 18·1: so that from 16 to 20 may be taken as the ordinary range for healthy adults, although Hutchinson gives the wide range of from 6 to 40. The average ratio which the number of respirations bears to the number of pulsations in a given time is about 1 : 4½, and if there is any great deviation from this ratio, there is probably some obstruction to the aëration of the blood, or some disorder of the nervous system. Thus, in pneumonia (or inflammation of the lungs), in which a greater or less amount of pulmonary tissue is unfitted for its office the number of the respirations increases in a more rapid proportion than the number of pulsations, so that the ratio becomes as 1 : 3, or even as 1 : 2. In hysteria, a similar or even greater deviation from the normal ratio may occur; and Elliotson records a case in which the respiratory movements were 98, or even 106, whilst the pulse was 104. On the other hand, in certain typhoid conditions, and in narcotic

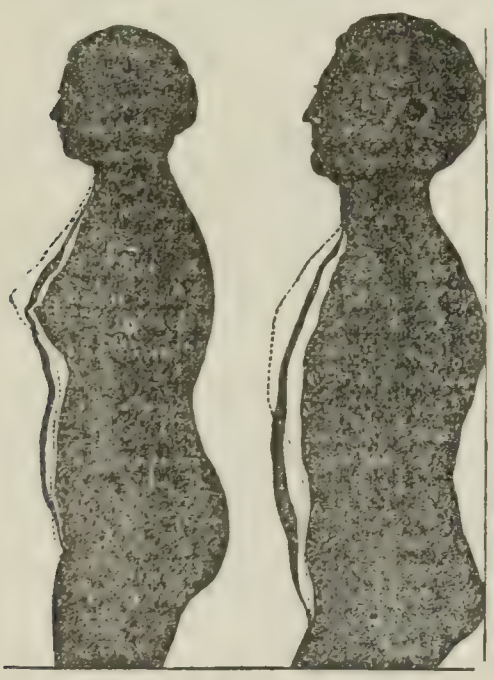

Fig 6.

Diagrams (by Hutchinson) shewing the extent of antero-posterior movement in ordinary, and in forced respiration in male and female. The back is supposed to be fixed, in order to throw forward the movement as much as possible. The black line indicates, by its two margins, the limits of *ordinary inspiration* and *expiration*. In *forced inspiration*, the body comes up to the dotted line, while in *forced expiration* it recedes to the smallest space indicated.

poisoning, the respiratory acts are diminished in number; the ratio of respiration to pulsations being as 1 : 6, or even 1 : 8.

We have next to inquire into the mode in which the muscular movements of respiration are kept up by nervous power. 'There can be no doubt,' says Dr Carpenter, 'that these movements, though partly under the control of the will, are essentially "automatic" in their nature. Their chief centres consist of two ganglia; corresponding to the origins of the pneumogastric nerves, which are the principal excitor nerves which convey the stimulus on which these movements are dependent; whilst from the adjacent parts of the medulla oblongata and spinalis proceed the chief motor nerves by which they are carried into effect. And thus it happens that the whole of the encephalon may be removed from above, and the spinal cord (as far up as the origin of the phrenic nerve) from below, without suspending the most essential of the respiratory movements.'—*Principles of Human Physiology* (6th edit., 1864, p. 274). It would carry us far beyond our assigned limits to notice the interesting series of phenomena that follow the division or irritation of the various branches of the pneumogastric nerve. We may, however, mention that when the trunks of this nerve are divided on both sides, the respiratory movements still go on, although with diminished activity. Hence, there must be other excitors to the action of the respiratory muscles. Amongst these, the nerves distributed to the general surface, and particularly to the face, probably perform an important part; and in exciting the first inspiration, the fifth pair seem the principal agent. In support of this view, Dr Carpenter adduces the well-known fact, that the first inspiratory effort of the new-born infant is most vigorously performed when the cool external air comes in contact with its face. Dr Marshall Hall, in his *New Memoir on the True Spinal Marrow*, p. 29, relates a case in which the first inspiration was delayed simply because the face was protected from the atmosphere by the bedclothes; the instant they were lifted up, the infant breathed. Many familiar facts demonstrate the influence of the superficial nerves on the respiratory system in the adult as well as in the infant. 'Every one,' to use Dr Carpenter's words, 'knows that the first plunge into cold water, or the first descent of the stream of the shower-bath, or even the dashing of a glass of cold water in the face, will produce inspiratory efforts; and this fact has many important practical applications. Thus, in the treatment of asphyxia, whether congenital or the result of narcotic poisoning, drowning, &c., the alternate application of cold and heat is found to be one of the most efficacious means of restoring the respiratory movements; and a paroxysm of hysterical laughter may be cut short by dashing a glass of cold water in the face.' The principal motor or efferent nerves concerned in bringing out the respiratory movements are the phrenic, going to the diaphragm; the intercostal, supplying the intercostal muscles; the facial and the spinal accessory nerves; although, as has been already mentioned, the superficial nerves generally exert a motor or efferent action.

How far the respiratory movements are under the influence of the will, is a question which has given rise to much discussion. That, in their ordinary mode of performance, they are independent of the will, is obvious from their systematic occurrence during sleep, in cases of paralysis in which the power of the will is lost, in apoplexy, &c. At the same time, universal experience teaches us that these movements are partly, but not entirely, under the control of the will. We can, with little inconvenience, suspend the respiratory actions for a minute or even longer, if we have previously introduced into the lungs a full supply of fresh air; but if the suspension be further prolonged, the stimulus conveyed by the excitor nerves to the nervous centres becomes so strong, that by no effort of the will can we avoid making inspiratory efforts. It is asserted by M. Bourdon, an eminent French physiologist, in his *Recherches sur le Mécanisme de la Respiration*, that no person ever succeeded in committing suicide by simply holding the breath, but that such persons have attained their object by holding the face under water, because here another set of muscles is called into play, which are much more under the control of the will than those of respiration. If we may venture to seek for the reason why, in man and the higher animals, the respiratory actions are placed under the direction of the will, it may probably be found in the necessary physiological connection that exists between them and the production of those vocal sounds by which individuals (whether men or animals) can communicate their feelings and wishes to one another.

We shall complete the subject in so far as human physiology is concerned, by noticing (1) the greatest quantity of air that can be expelled by a forcible expiration; (2) the total quantity that passes through the lungs in a given time; (3) the effects of respiration on the air; and (4) the effects of suspension or deficiency of respiration.

When the lungs have been emptied as much as possible of air by the most powerful expiratory effort, they still contain a quantity over which we have no control, and which may be estimated at about 40 cubic inches.* To this portion of the contents of the lungs the term *Residual Air* is applied. In addition to this residual air, physiologists distinguish, in connection with the respiratory process, *Supplemental Air*, which is that portion which remains in the chest after an ordinary gentle expiration, but which may be displaced at will; *Breathing* or *Tidal Air*, which is the volume that is displaced by the constant gentle inspiration and expiration; and *Complemental Air*, or the quantity which can be inhaled by the deepest possible inspiration, over and above that which is introduced in ordinary breathing. The greatest volume of air that can be expelled by the most powerful expiration, which is obviously the sum of the supplemental, breathing, and complemental air, is designated as the *Vital Capacity*—a term originally introduced by Dr Hutchinson, the inventor of the spirometer, who found, from nearly 5000 observations, that of all the elements or factors which might be supposed to influence it, *height* alone stood in a definite and constant relation to it, this relation being expressed by the rule, that, 'for every inch of stature from 5 to 6 feet, 8 additional cubic inches of air (at 60° Fahr.) are given out by a forced expiration after a full inspiration.' Thus, the vital capacity for a man from 5 feet to 5 feet 1 inch being 174 cubic inches, that for a man from 5 feet 1 inch to 5 feet 2 inches is 182 cubic inches; and so on. With regard to bodily weight as a factor, Dr Hutchinson found, that 'when the man exceeds the average weight (at each height) by 7 per cent., the vital capacity decreases 1 cubic inch per pound for the next 35 lbs. above this weight.' Age and muscular development do not influence the result so much as might have been expected. It has been not unfrequently observed that the vital capacity is small in athletic men, and that it has

* According to Hutchinson, as will be presently seen, this estimate is far too small.

been in excess in persons by no means remarkable for physical power. The *maximum* vital capacity met with by Dr Hutchinson was 464 cubic inches; this was in a man 7 feet high, whose weight was 308 lbs.; the *minimum* was 46 cubic inches, and occurred in the case of a dwarf whose height was only 29 inches, and who weighed 40 lbs.

In estimating the effects of the respiratory process upon the air which passes through the lungs, we shall adopt the *data* afforded by the recent observations of Dr Edward Smith, who has arranged a spirometer by which the quantity of air inspired may be registered from 1 to 100,000 cubic inches, and therefore for any period. This instrument, says Dr Carpenter (to whom Dr Smith has communicated many of the following statements for insertion in the new edition of his *Human Physiology*), 'he has used for 24 hours without intermission, except for meals, and he has ascertained the quantity of air inspired during sleep and in almost every condition met with during the day. From numerous experiments upon several persons, each extending over a whole day, he found that the average depth of inspiration was 33·6 cubic inches when at rest; and when walking at 1, 2, 3, and 4 miles an hour, 52, 60, 75, and 91 cubic inches, and even 107 cubic inches when working the treadmill. If we take 30 or 40 cubic inches as the average quantity exchanged at each respiration, we cannot but observe how small a proportion it bears to the entire amount which the lungs usually contain, for the "residual air" which cannot be expelled is estimated by Dr Hutchinson at from 75 to 100 cubic inches; and the "supplemental air," which can only be expelled by a forced expiration, is about as much more; the sum of the two being from 150 to 200 cubic inches, or from 5 to 7 times the "breathing volume."' Now, it is obvious that if no provision existed for mingling the air inspired with the air already occupying the lungs, the former would penetrate no further than the larger air-passages, and as this would be again thrown out at the next expiration, the bulk of the air contained in the lungs would remain altogether without renewal, and the expired air would not be found to have undergone any change. The law of the *Diffusion of Gases* (q. v.) here comes in play, for the air in the air-cells and finer tubes being charged by the respiratory process with a great excess of carbonic acid, as compared with the inspired air contained in the larger tubes, a diffusion of the carbonic acid necessarily takes place in the outward direction, while the oxygen from the air, or the air itself, similarly diffuses itself in an opposite direction, towards and into the air-cells themselves.

The *total amount* of air which passes through the lungs in 24 hours must obviously vary with the extent and frequency of the respiratory movements. Dr Smith found that during the day (6 A. M. to 12 P. M.), the average quantity of air inspired by several persons at rest was 502 cubic inches per minute, or a total of 542,160 cubic inches; and as the average quantity during the night was about 400 inches per minute, the total daily amount was 686,000 cubic inches. This quantity is largely increased by exertion, and Dr Smith computes that the total amount actually respired by the unoccupied gentleman, the ordinary tradesman, and the hard-working labourer, would be 804,780, 1,065,840, and 1,568,390 cubic inches respectively.

The *alterations* in the inspired air effected by respiration consist essentially in the removal of a portion of the oxygen, and its replacement by a nearly corresponding bulk of carbonic acid. The amount of carbonic acid in the expired air varies inversely with the number of respirations; it reaches 5·5 per cent. (or more) when the respirations are only 6 in the minute, while it falls as low as about 2·6 per cent. when the respirations are 96 in the minute. About 4·35 per cent. of carbonic acid is, on an average, added to the air in ordinary respiration; whilst about 4·782 per cent. of oxygen is removed; the actual diminution of bulk of the expired air (after the removal of the moisture obtained from the lungs) being about $\frac{1}{40}$th of its volume. Hence, unless where there is free ventilation, the air in an apartment containing men or animals must soon become vitiated by containing a great excess of carbonic acid (for ordinary atmospheric air only contains about one part of carbonic acid in 2500 parts), and a deficiency of oxygen. The absolute quantity of carbonic acid (and consequently of carbon) exhaled in 24 hours is liable to great variations, caused by the temperature and moisture of the air, age, sex, muscular development, the nature and quantity of the food, muscular exercise, sleep, state of health, &c. Dr Smith calculates that an adult man in a state of rest exhales in 24 hours an amount of carbonic acid equivalent to 7·144 oz. of carbon; and he estimates that it should be increased to 8·68 and 11·7 oz. for the non-labouring and laborious classes respectively, at their ordinary rate of exertion. We may add, that the total amount of carbonic acid is greatly increased by external cold, and diminished by heat; that it is increased by a moist, and diminished by a dry atmosphere; that it increases in both sexes to about the 30th year, when it remains stationary for 15 years, after which it diminishes; that at all ages beyond 8 years it is greater in males than in females, and that it increases during pregnancy; that it is greater in robust than in slender men, the quantity of carbon expired per diem to each 1 lb. of bodily weight being (according to Smith) 17·07, 17·51, and 17·99 grains at 48, 39, and 33 years of age respectively; that it is greatly increased by eating,* and is diminished by fasting; that it is increased by muscular exertion (Smith found that when walking three miles an hour he excreted 2·6 more carbonic acid than when at rest; while tread-wheel labour occasioned about double the excretion that was caused by walking); that it is diminished by sleep; and that it is increased in the exanthematous fevers (measles, small-pox, scarlatina, &c.), and in chlorosis; while it is diminished in typhus and in chronic diseases of the respiratory organs.

There has been much discussion with regard to the extent to which the nitrogen of the air is affected by respiration. Usually a small amount of this gas is given off, but the quantities absorbed and exhaled so nearly balance each other, that its special action on the organism must be very trifling, further than as being a diluter of the oxygen, which would be too stimulating if breathed in a pure state. We therefore proceed to the consideration of the watery vapour with which the exhaled air is saturated. The amount of this fluid exhaled in 24 hours may range from about 6 to 27 oz., its usual range being between 7 and 11 oz. It is not pure water, but holds in solution a considerable amount of carbonic acid and an albuminous substance in a state of decomposition, which, on exposing the fluid to an elevated temperature, occasions a very evident putrid odour.

RESPIRATION, ARTIFICIAL, is required in all cases of suspended animation, from drowning,

* We regret that our limited space totally precludes us from noticing Dr Smith's laborious investigations on the effect of different kinds of food and drink on the excretion of carbonic acid. The reader will find them described in several of the recent volumes of the *Philosophical Transactions*.

noxious gases, chloroform, &c. It may be performed either by forcing air into the lungs by means of a pipe passed through the mouth or the nostril into the glottis, or (which is usually preferable) by imitating the natural expansion of the chest by muscular effort, as by the methods invented by the late Dr Marshall Hall and by Dr Sylvester.

The best mode of forcing air into the lungs is by the use of a small pair of bellows, with the nozzle inserted in one of the patient's nostrils. The air should be driven into the lungs with extreme gentleness, the larynx being pressed backwards against the spine, so that the air may not go into the œsophagus and stomach. Gentle but firm pressure must be then applied to the chest to expel the introduced air, and fresh air again driven in; and this process of introducing and expelling the air alternately must be continued until either natural respiratory efforts appear, or the case becomes hopeless.

In the article ASPHYXIA it is stated that the best method of filling the lungs of an asphyxiated person (as, for instance, a person apparently drowned) with fresh air, is that of Dr Marshall Hall. Dr Sylvester's method (*The True Physiological Method of Restoring Persons apparently Drowned or Dead, and of Resuscitating Still-born Children*, London, 1859) is now generally regarded as decidedly preferable to that of Dr Marshall Hall, although the same in principle. The following are Dr Sylvester's rules, as slightly modified by a committee, whose investigations will be presently noticed. The patient is laid on his back on a plane, inclined a little from the feet

Fig. 1.

upwards; the shoulders are gently raised by a firm cushion being placed under them; the tongue is brought forward, so as to project a little from the side of the mouth. The operator then grasps the patient's arms just above the elbows, and raises them till they nearly meet above the head. This action

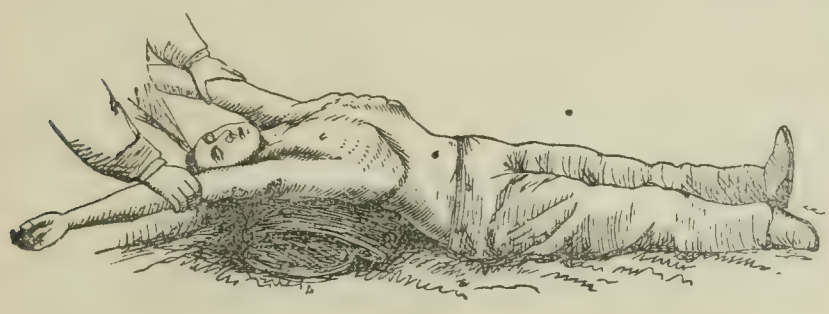

Fig. 2.

imitates inspiration. The patient's arms are then turned down, and firmly pressed for a moment against the sides of the chest. A deep expiration is thus imitated; and these two sets of movements should be perseveringly continued at the rate of about 15 times in a minute.

Two important documents on this subject have appeared since the first publication of the article ASPHYXIA. The first of these is the *Report of the Scientific Committee on Suspended Animation*, presented to the Royal Medical and Chirurgical Society of London in July, 1862; and when it is stated that this Report was signed by 'C. J. B. Williams, *Chairman*, W. S. Kirkes, George Harley, J. B. Sanderson, C. E. Brown-Séquard, H. Hyde Salter, E. H. Sieveking, and W. S. Savory, *Honorary Secretary*,' its scientific claims to our attention are undeniable. The following are their suggestions in relation to treatment: 1. That all obstruction to the passage of air to and from the lungs be at once, so far as is practicable, removed; that the mouth and nostrils, e. g., be cleansed from all foreign matters or adherent mucus. 2. That in the absence of natural respiration, artificial respiration by Dr Sylvester's method (as already described) should be employed. 3. That if no natural respiratory efforts supervene, a dash of hot water (120° Fah.) or cold water be employed, for the purpose of exciting respiratory efforts. 4. That the temperature of the body be maintained by friction, warm blankets, the warm bath, &c. [Whether the warm bath is serviceable or positively hurtful is, however, still an open question]; and 5. That in the case of drowning, in addition to the foregoing suggestions, the following plan may, in the first instance, be practised: Place the body with the face downwards, and hanging a little over the edge of a table, shutter, or board, raised at an angle of about 30°, so that the head may be lower than the feet. Open the mouth, and draw the tongue forward. Keep the body in this posture for a few seconds, or a little longer if fluid escapes. The escape of fluid may be assisted by pressing once or twice upon the back.

The other document to which we referred is entitled *Instructions for the Restoration of the apparently Dead from Drowning*, and was issued in 1864 by 'The National Lifeboat Institution.' In these *Instructions* (a copy of which should be in the possession of every family), it is recommended, that if breathing cannot be excited by the application of stimulants to the nostrils, or by dashing water on the face, Marshall Hall's method should be tried; and that if this do not prove successful in from two to five minutes, Dr Sylvester's method should be resorted to.

In conclusion, a reference must be made to the *Reports of the Scientific Committee* [of the members of the Royal Medical and Chirurgical Society] *on the Uses and Effects of Chloroform*. The committee decide that the most certain means of restoring life after poisoning with anæsthetics is by artificial respiration. 'By this means, resuscitating may generally be accomplished after natural respiration has ceased, provided the heart continue to act; and it may *sometimes* be effected even after the cessation of the heart's action. Galvanism resuscitates within the same limits as artificial respiration; it is, however, far less to be relied on in equal cases. Galvanism may be used in addition to artificial respiration; but the latter is on no account to be delayed or suspended, in order that galvanism may be tried.'—*Proceedings of the Royal Medical and Chirurgical Society*, vol. iv. 1864.

RE'SPIRATOR, is the name given by its inventor, Mr Jeffreys, to an instrument which gives warmth to the air drawn into the lungs in breathing. It is attached to the mouth, and is composed of several layers of very fine wire, fixed so near together, that the exhaled air passing through

them is diffused over a very large amount of surface, its warmth being absorbed by the metal, which, being an excellent conductor of heat, freely returns it to the cold air, drawn in through it in the act of inspiration. Mr Jeffreys considers it necessary that about twenty layers of metal-work should be used, and in order to make the instrument as light and compact as possible, each layer must be extremely thin. The apparatus usually consists of from eight to twelve frames of sheet-silver or other metal, about 3½ inches long, 1½ inch wide, and $\frac{1}{1000}$th of an inch thick, the metal of which is pierced away by machinery so as to leave only a narrow framework, consisting of six vertical bars $\frac{1}{30}$th of an inch wide, and five horizontal bars, with a width of $\frac{1}{50}$th of an inch thick. To each side of each of these frames is soldered a layer of wires 1½ inch long, and $\frac{1}{4000}$th of an inch thick. These wires are laid at about $\frac{1}{2000}$th of an inch apart, and are so numerous, that a large respirator of high power contains 2000 feet of wire, divided into about 12,000 pieces, and soldered to the frames at more than 80,000 points. The frames, of wire-work, are fixed parallel to each other, and kept a small distance apart by small knots of a bad conductor of heat, so that the inner layer is always kept at almost the temperature of the expired air, and each successive layer diminishes in warmth, till the outer one is nearly as cold as the external air. By this arrangement, the air that is inhaled meeting with layers of wire of gradually increasing heat, is raised in the most powerful respirators to the highest attainable temperature. Such respirators have twenty-four layers of wire-work, those of medium power sixteen, and the weakest eight. The whole of the wire-work is curved, so as to fit closely to the face, and is enclosed in a border or case of soft leather; and an outer coat, usually of a very fine and open woollen fabric, is added. The form of instrument chiefly used is fixed over the mouth, and is named *The Oral Respirator*. For an instrument to cover both the mouth and nostrils, the term *Orinasal Respirator* is used. As defective and imperfect imitations of Mr Jeffreys' respirator have been advertised, the original inventor has recently superadded the word *Pneumoclime*, or 'Climate for the Lungs,' to all the respirators for which he holds himself responsible. The use of these instruments in allowing persons with delicate lungs to take out-of-door exercise with safety and advantage in comparatively severe weather, is now universally recognised by the medical profession.

RESPI'RATORY SOUNDS, are of the greatest importance in the diagnosis of the diseases of the lungs. They may be divided into (1) those directly resulting from inspiration and expiration, and (2) those of the voice, including coughing.

In the healthy state of the lungs, two distinct sounds are heard, on applying the ear, either directly or through the intervention of the stethoscope, to the walls of the chest—one called the *vesicular sound*, because it is supposed to be caused by the passage of the air from the ultimate tubes into the air-cells or vesicles; and the other the *bronchial sound*, because it is generated in the bronchial tubes by the air moving through them.

The vesicular sound, known also as the *respiratory murmur*, is mainly produced during inspiration, being very faint, and sometimes scarcely perceptible during expiration. It is rather a rustle than a murmur, and has been compared to the sighing of a gentle breeze amongst leaves, to the sound made in the deep inspiration of a sleeping person, &c.; but a single minute's application of the ear to the chest of a healthy person below the collar-bone, will give a clearer idea of its true nature than any mere description could convey. The sound is more distinct in thin than in fat persons, in women than in men, and in children than in adults. Indeed, it is so loud in children, that when an unusually noisy sound is heard in an adult, it is said to be *puerile*. The *bronchial sound* has a blowing character, such as may be produced by blowing air quickly through a tube, and is altogether distinct from the former. It may be most clearly heard over the trachea or windpipe, and at the upper part of the sternum or breast-bone.

Such are the sounds as they occur in the healthy lungs. In disease, any change which tends to impair the respiratory function in one part of the lungs, will make the vesicular murmur abnormally weak there, and abnormally loud in the remainder; and there are other changes, besides a mere increase or decrease of intensity, that sometimes occur, and into which we have no space to enter. The bronchial sound is also liable to morbid alteration; for example, it may be heard in parts of the chest where it is usually inaudible, in consequence of condensation of the surrounding pulmonary tissue, or from dilatation of the tubes, independently of condensation; and in violent dyspnœa, it may sometimes be heard over the whole chest without any change of structure. These morbid sounds are only modifications of those which occur in health. There are, however, other sounds generated by disease which are highly important in diagnosis. These are termed *Râles* by the French, and *Rattles*, *Sibilus*, *Rhonchus*, &c., by those English writers who do not adopt the French term. They may be briefly divided into the *dry* and the *moist râles*, the former being caused by the passage of the air, with increased rapidity, through narrowed portions of the bronchial tubes; while the latter are formed by the passage of air through a fluid of more or less tenacity in the bronchial tubes, causing the formation of a succession of bubbles, whose bursting occasions the sound.

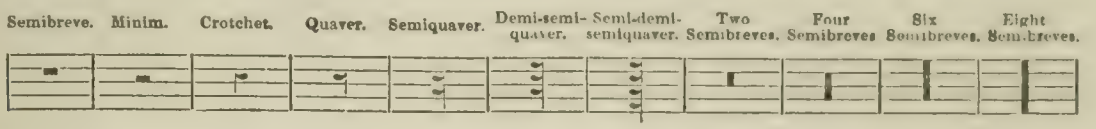
There are two other morbid sounds connected with the respiratory system which deserve to be named in this list, viz., *metallic tinkling* and the *friction sound*. Metallic tinkling is a quick and sharp sound, resembling that produced by striking a glass vessel with a pin. Its occurrence affords evidence of the existence of a cavity of considerable size, containing air, and surrounded by firm walls; but how the sound is produced is not definitely settled. The friction sound is produced by the rubbing together of the pulmonary and costal pleuræ when rough from inflammatory action, and is indicative of pleurisy.

RESPO'ND, in Gothic Architecture, a half-pier attached to a wall, and supporting an arch, &c.

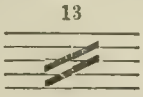
RESPO'NDENT is the name of the party against whom another party presents a petition to a court which requires to be answered. The word is used in England as well as in Scotland, but more frequently in England.

RESPONDE'NTIA is a mode of raising money by a master of the ship in critical and desperate circumstances, when he has no other means of doing so, and when the object is to rescue or save the ship and cargo for the benefit of all parties. He goes to a person who advances a sum of money, and takes a mortgage of the goods or cargo, but in such a way that if the goods never arrive, the creditor loses his whole security, and cannot claim repayment from the owner of the ship. When money is borrowed in a similar way on the security of the ship itself, it is called Bottomry (q. v.). In both cases the security is in the form of a bond.

RESPO'NSORIES (Lat. *responsorium*, a response),



short sentences, generally verses or portions of verses from Scripture, which are assigned in the church services, to be answered by the people to the officiating clergyman. Responsories are appended to lessons, to chapters, and to versicles, in common with which they are either chanted or simply repeated, according to the nature of the service. They are found in all the ancient liturgies, and occur also in the Book of Common Prayer. In the latter the name given to them is RESPONSE; but in the ancient service-books, as well as in the modern Breviary, they are called as above.



REST, in Heraldry, the name usually given to a charge of the form indicated in the subjoined figure, varying, however, considerably in different representations. It appears at too early a date to be what it is often said to be —a spear-rest. It is sometimes called an organ-rest, and in old rolls, a clarion —and is most likely a representation of some musical instrument like the Pandean pipe. It was a rebus-badge of the Clares.

Rest.

REST, in Music, an interval of silence occurring in the course of a movement between one sound and another. The duration of a rest, like the duration of a note, is indicated by the form of the character representing it.

For rests of a still longer duration, it is now usual to draw one or two oblique lines across the staff, and write on them in figures the number of measures during which the voice or instrument is to be silent. Thus,  in common time, denotes a rest of 13 semibreves. A rest, like a note, may be prolonged by one or more dots.

REST-HARROW (*Ononis*), a genus of plants of the natural order *Leguminosæ*, suborder *Papilionaceæ*, having a 5-cleft bell-shaped calyx, the standard of the corolla large and striated, the keel beaked, the pod turgid and few-seeded. There are many species, chiefly natives of Europe, and generally herbaceous or half-shrubby.—The COMMON R. (*O. arvensis*) is abundant in pastures and by waysides in Britain. Its lower leaves have three leaflets, the upper are simple; the flowers are axillary and rose-coloured, or occasionally white. The plant is half-shrubby, with somewhat spiny stems; viscid; and its smell strong and unpleasant. The roots are tough and woody, whence its English name. It is sometimes a troublesome weed, but only in neglected pastures, and disappears before careful cultivation.

RESTIA'CEÆ, a natural order of endogenous plants, nearly allied to *Cyperaceæ*, mostly natives of the southern hemisphere, and abounding at the Cape of Good Hope and in Australia. They are herbaceous plants, or sometimes half-shrubby, have simple stems, and narrow leaves; and are hard, wiry, and rush-like. They have generally a creeping root-stock. The flowers are in heads or spikes, generally unisexual, with 2—6 glumes, sometimes with none, two or three stamens, an ovary with 1—3 cells, one ovule in each cell, the fruit a capsule or nut. *Restio tectorum* is much used for thatching houses at the Cape of Good Hope. *Wildenowia teres* is used for making baskets and brooms.

RESTIGOUCHE, a river in the north-west of the colony of New Brunswick, forms for about 50 miles the boundary between that colony and the Province of Quebec. It is 200 miles in length, and falls into Chaleur Bay, which opens into the Gulf of St Lawrence. For the last 18 miles it is navigable for the largest ships.

RESTITU'TION, in Scotch Law, is the obligation of the purchaser of a movable, which really belongs to a third party, to deliver it up to such real owner without claiming repayment of price. An action lies to recover restitution of money paid in mistake. See REPETITION.—In English Law, the word restitution is used in similar circumstances to denote delivery up of possession to the rightful owner. Thus, in case of goods stolen, the criminal court may order restitution of the goods to the owner.

RESTORA'TION, a term applied, in English history, to the resumption of monarchical government, on the accession of Charles II., May 29, 1660, after an interval of eleven years, from 30th January 1649, when Charles I. was beheaded, during which the government of Great Britain was republican. The Restoration was appointed by various statutes to be observed as a festival in the Church of England, with special religious services; but its observance was abolished in 1859 by act 22 Vict. c. 3.

RESTORA'TIONISTS, a sect which, under a new name, has revived a very ancient doctrine, which has found advocates at all times since the days of Origen (q. v.). One of the most remarkable doctrines of that Father was his belief of a general *apokatastasis*, or 'restoration' of all things, in which, after a purgation proportioned to the various moral conditions of their souls at the time of death, all men, however wicked, and all the evil angels, even Lucifer himself, would be restored to the favour of God, and reunited to Him in heaven. This doctrine was condemned at the time, and has since been repeatedly rejected by the churches of the East as well as of the West. The doctrine has been renewed in more than one form since the Reformation by various classes, who have taken the name of Universalists (q. v.). The particular title of R. was given in America to the followers of a preacher named Ballou, who, in addition to the tenet above explained, held that all retribution is confined to this life, and who, although he denied the immortality of the soul, yet taught that at the resurrection all men will be admitted to everlasting happiness. The R. are said to exist chiefly in Massachusetts.

RESURRE'CTION. This expression denotes the revival of the human body in a future state after it has been consigned to the grave. We find traces of this doctrine in other religions, and especially in later Judaism, but the doctrine is peculiarly Christian. In the earlier Hebrew Scriptures, there is no mention of it. It is not to be found in the Pentateuch, in the Psalms, nor even in the earlier prophecies. It is supposed to be alluded to in Isaiah (xxvi. 19), and in Ezekiel (xxxvii.) in the well-known chapter as to the revival of dry bones in the valley of vision; and in the last chapter of Daniel (xii. 2), there is the distinct affirmation that 'many that sleep in the dust of the earth shall awake, some to everlasting life, and some to shame and

everlasting contempt.' There is also a well-known passage in Job (xix. 25—27) which has been thought by some to refer to the doctrine of the resurrection of the body. Almost all recent criticism, however, denies the validity of this reference, as unsupported by a correct rendering of the words themselves; and especially by the whole scope of the argument of the book, which confines its view of retribution to the present life. The idea of a future resurrection would have presented to the mind of the patriarch a more conspicuous solution of the enigmas of Providence which perplexed him, and could not have failed to be introduced into the argument by some of the speakers, had it formed an element of their religious knowledge; but they nowhere allude to it. It is only, therefore, in the later Judaism that the doctrine appears. In the time of our Lord, it had become a formal doctrine of the Pharisees. The general body of the Jewish people seem also to have believed in it. The Sadducees alone disputed it (Matt. xxii. 23, sq.; Luke xx. 27, sq.; Acts xxiii. 6—8). It appears, in fact, to have become bound up in the Jewish mind with the idea of a future life, so that an argument which proved the one proved the other; and the Sadducees not merely denied the distinctive idea of the resurrection, but further denied that there was any 'angel or spirit.'

It remained for Christ and his apostles to reveal clearly the doctrine of the resurrection of the body, and to connect it with the fact of Christ's own resurrection as its special evidence and pledge. The following may be stated as the main points involved in the doctrine as revealed in the New Testament: 1. The resurrection of the dead is ascribed to Christ himself; it will complete his work of redemption for the human race (John v. 21; 1 Cor. xv. 22, sq.; 1 Thess. iv. 14; Rev. i. 18). 2. All the dead will be raised indiscriminately to receive judgment according to their works, 'they that have done good, unto the resurrection of life; and they that have done evil, unto the resurrection of damnation' (John v. 21—29; 1 Cor. xv. 22; Rev. xx. 11). 3. The resurrection will take place at 'the last day,' by which seems to be meant the close of the present world (John vi. 39, 40, xi. 24; 1 Thess. iv. 15). 4. The great event is represented as being ushered in by the sound of a trumpet, a representation probably borrowed from the Jewish practice of convening assemblies by sound of trumpet (1 Cor. xv. 52; 1 Thess. iv. 16). 5. As to the character of the change through which our bodies are raised after the lapse of ages, and get their identity preserved, there is nothing distinctly made known. The impossibility of such a change was evidently a subject of argument in the primitive Christian age, and the apostle argues strongly in its favour (1 Cor. xv. 32, sq.) from occurrences which are scarcely less mysterious in the natural world. It is not professed, however, that such occurrences really explain or throw light upon the fact of the resurrection. The apostle designs rather to silence cavils, and to invigorate faith, than to render an account of the actual manner of the resurrection. Arguing from God's infinite power as displayed in the processes of creation, he would, as it were, press the question which he asks elsewhere: 'Why should it be thought a thing incredible with you that God should raise the dead?' (Acts xxvi. 8), rather than attempt any explanation of which the subject does not really admit. And this is the only becoming spirit in which this great doctrine can be contemplated by any mind. The fact of a resurrection of the dead is clearly revealed; but the *mode* of the fact necessarily transcends our present intelligence.

RETAI'NER is, in English Law, the act of engaging an attorney or counse to attend to a certain suit or case. The retainer of an attorney may be either verbal or in writing; but the retainer of a counsel is always by writing; i.e., by a written memorandum delivered by the attorney to the counsel. The retaining of a counsel is generally a precautionary measure resorted to only in the case of eminent counsel, the effect of it being to prevent the other party from securing the services of such counsel; and this is considered a prudent precaution in most cases of importance. The usual fee, however, must be paid over and above the retaining fee, which is a small fee varying with the court in which the litigation arises.

RETAI'NING WALLS. These, as their name implies, are walls built to retain earth, sand, or other incoherent substances in positions and forms which without their aid they could not maintain.

These substances, if left to themselves, will not stand with vertical sides, but will fall down till they assume a certain slope. The angle which this slope makes with the horizontal is called the 'angle of repose.' This angle varies according to the nature of the material; for example, that of moist soil is about 45°, while fine sand assumes an angle of about 30°.

In fig. 1, E represents a section of a mass of earth,

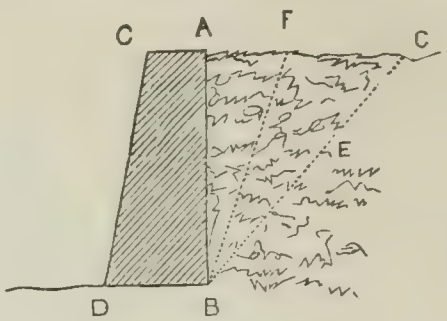


Fig. 1.

which it is desired to retain by means of the wall ABCD.

If we draw BG from B at the angle of repose, it is evident, from what has been said, that the prism ABG is kept in position by means of the retaining wall; and if the earth began to give way, it would do so by slipping on some line, BF. The wedge-shaped piece, ABF, which has the greatest tendency to separate itself from the rest of the mass, is called the 'prism of greatest pressure;' and the retaining wall ABCD must be made of sufficient weight and thickness to prop it up and resist its tendency to slide. The line BF is found to bisect the angle ABG.

In estimating the requisite thickness of the wall, it must be taken into account that the wall may give way in various manners; it may be overturned, or it may slide as a whole along its base DB, or the upper parts may give way, while the base remains.

From these data, mathematical formulæ have been worked out, which determine the thickness requisite for different situations and materials, such as that given by M. Poncelet for ordinary materials, and within ordinary limits:

$$x = \cdot 285(H + h).$$

Where H, the height of the wall, and h, the additional height of the bank above the top of the wall, being given, x, the thickness of the wall, can be found.

These formulæ, however, are not of much practical value, on account of the varying nature of the data on which they are founded, and of the excess of strength requisite in all such constructions, to

allow for causes of failure, which cannot be foreseen or provided for in the calculations. Practical experience is found to be the only safe guide in all such considerations.

Figs. 2, 3, and 4 represent sections of forms of retaining walls in common use. Figs. 2 and 3 are used in retaining earthworks, while fig. 4 is a common form of dock-wall.

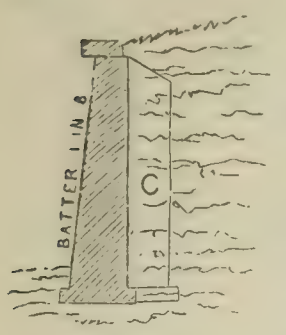

Fig. 2.

In that shewn by fig. 2, the thickness at the top is made from 2 to 3 feet; the back is vertical, and the front is sloped out 1 foot for every 8 feet in height; so that the thickness increases with the height, in the same manner as the pressure of the earth, which it is required to resist.

The foundation is made of large stones, extending beyond the sides of the wall, so as to distribute the pressure on as large a surface as possible. It is also sunk for 2 or 3 feet below the adjoining surface, so as to resist its tendency to slip on its base.

At its back are placed counterforts, C, which are built up with the wall, and are about 3 feet long by $2\frac{1}{2}$ feet wide, placed from 8 to 10 feet apart. These counterforts stiffen the wall like ribs; they put its centre of gravity further back, and so resist the tendency to heeling or overturning; they also act advantageously in dividing the earth, and so diminishing the length of the mass, which can act together against the wall. This form of wall is very simple in construction.

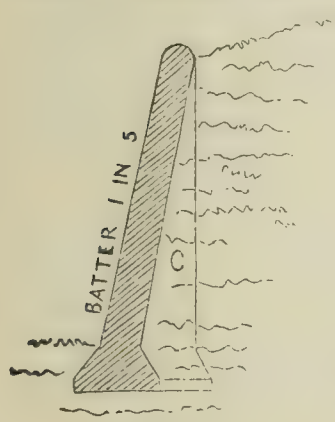

Fig. 3.

The form of wall shewn in fig. 3 is that which requires the least material; it also, on account of its thinness, dries and consolidates rapidly, but is not so easily built as that shewn in fig. 2.

The dock-wall shewn in fig. 4 is made much heavier than the simple pressure of the earth behind it would require; for it has many strains to bear of an exceptional character due to its situation; such are the machinery and goods deposited on the

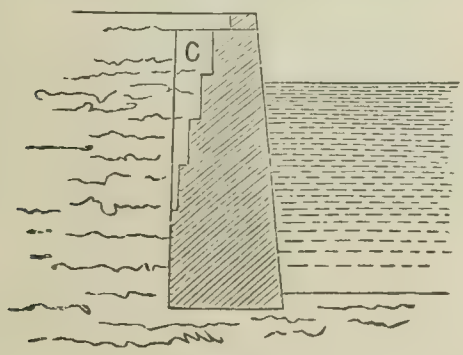

Fig. 4.

quays, and the possible accident of the dock being suddenly emptied of water, while the earth behind the wall is full of water.

In the construction of a retaining wall, a great desideratum is, that the earth behind it be well drained; for if water be allowed to accumulate behind the wall, the earth gets into a semi-fluid state, in which it gives a very much increased pressure on the wall. For this purpose, holes are left through the wall called 'weeping-holes;' these holes are about 9 inches high and 2 inches wide, and are generally placed about 1 for every 36 square feet of wall. Also stones without mortar are frequently built up behind the wall, so forming an open stratum, into which the water drains, and is thence carried off through the weeping-holes.

RETE'NTION OF URINE is the term employed in medicine to signify a want of power to discharge the urine from the bladder, and it must be carefully distinguished from a far more serious affection known as *suppression of urine*, in which also no urine is passed, because in this case there is none in the bladder.

Retention may arise either from change of structure of the parts concerned in the expulsion of the urine, or from mere disordered function unaccompanied by change. The former are termed *organic*, and the latter *functional* causes of retention.

Amongst the chief organic causes are: 1. Permanent stricture of the urethra (q. v.). 2. Contraction of the urethra, in consequence of a blow on the perinæum, or other external injury. 3. Tumours within the urethra. 4. Foreign bodies in the urethra, as calculi, clots of blood, or mucus, &c., which have entered it from the bladder, or fragments of bougies, &c., introduced from without. 5. Enlargement of the prostate gland, especially in aged men. The treatment in retention from these causes must be entirely left in the hands of the surgeon.

The principal functional causes are: 1. Spasm of the urethra, often termed spasmodic stricture; and 2. Want of power in the muscular coat of the bladder and urethra.

Spasm of the urethra is most likely to occur in those who have a slight permanent stricture, or a urethra irritable from other causes. The spasm usually follows exposure to cold and wet, but it may likewise be excited by piles or other sources of irritation in the lower bowel, or by the use of cantharides either taken internally as a medicine, or absorbed from blisters applied to the skin. The patient finds himself unable to pass his water, although he has a great desire and makes strong efforts to do so. The bladder soon becomes so distended that it can be felt as a tense round tumour above the pubes. If relief be not speedily afforded, the bladder may burst, and discharge its contents into the peritoneal cavity, in which case death rapidly ensues; or the urethra behind the stricture gives way, and the urine is extravasated into the cellular tissue of the adjacent parts—a condition which, if not promptly relieved by surgical interference, is likely to be followed by gangrene, typhoid symptoms, and death.

If the symptoms are not very severe, and there is no evidence of old permanent stricture, a hot bath, combined with the administration of the tincture of muriate of iron, in doses of ten minims, taken every ten minutes in thin gruel or in barley-water, will often give relief. Sometimes a full opiate administered by the mouth, or preferably as an enema, or the inhalation of a few whiffs of chloroform, will, by allaying the spasmodic action, give immediate relief. If these means fail, surgical assistance must be at once procured, and the bladder evacuated by a catheter—an operation often requiring very delicate manipulation. If these means fail, which only happens when the spasm is associated with old-standing disease of the urethra,

the surgeon must either puncture the bladder through the rectum, or above the pubes, or make an incision into the urethra either at or behind the seat of the stricture.

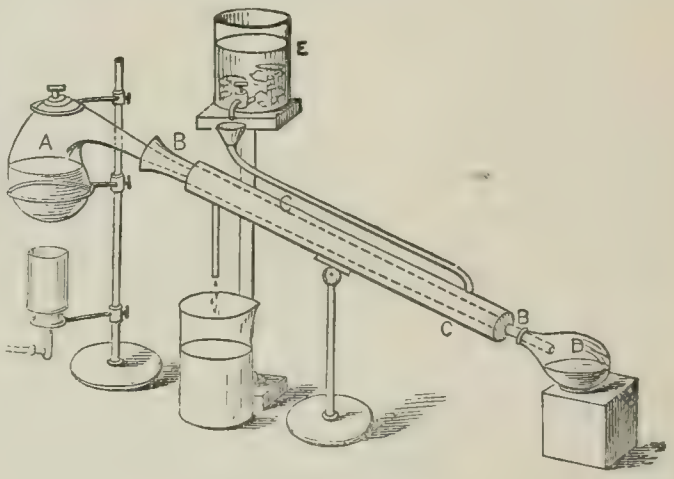
Paralysis of the muscular coat of the bladder may arise from the debility of old age, from the depressed state of the nervous system in fevers of the typhoid type, from injury or disease of the head or spine, and from various other causes. In a temporary form, it is often a result of over-distention of the bladder from stricture or prostatic disease, and it sometimes occurs in the case of nervous sedentary persons, if they have allowed rather more than the usual time to elapse without evacuating the bladder. It should be generally known that retention of urine from paralysis is sometimes accompanied with dribbling away of the water, so that the retention might at first sight be mistaken for *incontinence* of urine. On examination, however, it will be found that the bladder is abnormally distended, and cannot be evacuated by the act and will of the patient.

In these cases, the urine must for a time be regularly drawn away by the catheter. General tonics, such as the cold-bath (or sometimes preferably the sitz-bath) and chalybeates, must be given to improve the general health; while medicines which are supposed to act locally on the mucous coat of the bladder or on the spinal cord, must be simultaneously administered.

A peculiar form of retention sometimes occurs in women of hysterical temperament, in which the will rather than the power is at fault. The treatment should here be directed towards the general hysterical tendency, rather than to this special manifestation of it.

RETFORD, EAST, a small municipal and parliamentary borough and market-town in the county of Notts, on the right bank of the Idle, an affluent of the Trent, 138 miles north-north-west of London by the Great Northern Railway. West R., on the other side of the river, and connected with East R. by a strong bridge of five arches, is a more modern and much smaller town. Tanning and coachmaking are carried on to some extent. Pop. of municipal borough (1861), 2982; of parliamentary borough, which returns two members to parliament, and which includes several parishes and districts, 47,330.

RETHEL, a small town of France, in the department of Ardennes, prettily situated on the right bank of the Aisne. Woollen fabrics, flannels, merinos, &c., are extensively manufactured, and there are tanneries, breweries, and iron-foundries in operation. Pop. 6966.



RE'TINA. See Eye.

RETI'REMENT, ARMY AND NAVY. In every service, to maintain a reasonably low age among the persons actively employed, it is essential that some scale should be fixed for retirement of old and worn-out officers and men; and it is the great bane of the British civil service that there is no fixed age at which Superannuation (q. v.) becomes compulsory. In the army, medical officers are allowed to retire after 25 years full-pay service; other officers after 30 years on full pay, or 25 years on half pay. In the navy, officers are placed on the retired list at 60 years of age, if they have not served in the rank they then hold. In most cases, in both services, the retiring officer is allowed a step of honorary rank; but this higher rank carries neither present nor prospective advantage. American army officers retired from active service are entitled to the pay proper of the highest staff or regimental rank held at the time of retirement, and four rations per day. If retired for disability from wounds received in battle, they are entitled to the retired pay of the rank they held at the time such wound was received. Officers of the navy on the retired list and not on duty, not retired on furlough pay, are entitled to one-half the pay to which such officers would be entitled if on duty at sea, provided the rate of pay has not been fixed by law. The provisions for the retirement of British common soldiers and sailors are stated under PENSIONS, DISCHARGE, &c.

RETO'RT, a vessel employed by chemists for the purpose of distilling or effecting decomposition by the aid of heat. It may be made of glass, earthenware, or metal, according to the purposes for which it is to be employed.

Glass retorts are the most common, and their ordinary form is seen in the figure. They may be employed for the production of such products as do not require any extraordinary degree of cold for the condensation of their vapour—as, for instance, for the production of hydrocyanic or nitric acid. The globular vessel in which the neck of the retort is inserted is from its function termed *the receiver*. Cold may be applied to the neck of the retort—for the purpose of condensing the vapour—in various ways, as by the application of a cold wet cloth, by a current of water, or by a special apparatus known as *Liebig's Condenser*.

In the accompanying figure a *Liebig Condenser* is fitted on to the retort. A is the bulb of the retort, into which the matter to be distilled is inserted. It can be opened or closed at will at the top by a ground-glass stopper. From the bulb the neck proceeds, and its termination is seen in the receiver, D. The condenser, BB, embraces the greater part of the neck of the retort. It consists of a glass tube, tapering from end to end, fixed in the centre of a metal pipe, provided with tubes, so arranged that a current of cold water may circulate through the apparatus. By putting a few pieces of ice into the little cistern, E, the temperature of this water may be kept at 32° and extremely volatile liquids condensed.

Liebig's Condenser.

The retort may be heated in various ways—as by means of a lamp, or by placing its body in a sand-bath, or even in the fire; in the last case, the retort is usually protected by a coating of lute.

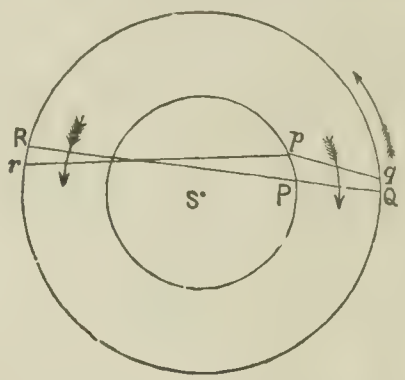
In ordinary cases requiring a higher temperature than glass could bear, earthen retorts are used; for the preparation of hydrofluoric acid, retorts of lead are employed; while for the preparation of strong sulphuric acid, platinum is the best material for the

retort. Iron retorts are employed in the laboratory for the preparation of oxygen from black oxide of manganese and some other processes; and in gas-works, for the destructive distillation of coal.

RETREA'T, in Military Language, signifies a retrograde movement of a force, with the intention of avoiding an encounter with a hostile body in the front. The greatest exertion of talent is requisite in a general to conduct an able retreat, more depending on arrangement and coolness than even in the preliminaries of a battle. When the enemy pursue, if the retreat is not to degenerate into a rout, the retreating army must be covered by a powerful rear-guard, which from time to time must hold the pursuers at bay, while the artillery-train and baggage pass defiles, cross streams, and overcome other special obstacles. A strong retreat is made when the rear is formed by a line of solid battalions, of which alternate masses retreat, while those intervening face about and oppose the enemy; the latter afterwards retreating between and to the rear of those which retreated in the first instance. The retreat is thus continued by alternate halting and falling back on the part of each corps.

RETRE'NCHMENT, in Fortification, is a defensive work, comprising at least ditch and parapet within some other work of a fortress, and intended as a place of retreat for the defenders, whence they may prolong the defence, or capitulate after the faces of the work itself have fallen into the enemy's hands. The retrenchment bears a considerable resemblance to the *réduit*, except that it is almost always of earth. Retrenchments are made in ravelins, and the re-entering *places d'armes* at the time of constructing those works. A retrenchment is thrown across the gorge of a redan or bastion, or from shoulder to shoulder, when it is apprehended that the salient angle will fall into the possession of the besiegers; these retrenchments are usually made when wanted. Such a retrenchment across the interior of the Redan at Sebastopol caused the sanguinary repulse of the British on the 8th September 1855.

RETRIE'VER, a dog specially trained to go in quest of game which a sportsman has shot, and particularly useful in fatiguing ground or in marshy



Retriever.

places. No particular breed is designated by this name, and retrievers are generally cross-bred, a large kind much in use being the progeny of the Newfoundland dog and the setter; a smaller kind, better suited for the pursuit of the smaller kinds of game, a cross between the spaniel and the terrier. Spaniels are also sometimes trained as retrievers. The training requires much assiduity and patience, the dog being apt at first to be drawn from the proper quest by any water-rat or other creature that presents itself, and also to bite the game too hard, so as to injure it. A thoroughly trained R. therefore commands a high price, being of great use to the sportsman. A high degree of intelligence is requisite in a R.; it is very often the attached companion of its master, and an inmate of the mansion rather than of the kennel.

RE'TROGRADE. This is a term applied to the motion of the planets and comets among the fixed stars, when they appear to move in the *reverse* order of the signs of the Zodiac (q. v.). All the planets move in the same direction round the sun, and therefore their retrograde motions must be due to their motion relative to the earth. In the case of comets, however, we have instances of motion about the sun in the opposite direction to that of the planets, and in such orbits the motion (referred now to the sun, not to the earth) is said to be retrograde.

In the case of the planets, which is thus the only one we need consider, let S be the sun, and let the two circles represent the orbits of two planets. First, let the planets be, as at P and Q, towards the

same side of the sun. The inferior planet has of course the greater velocity; and therefore, if p and q represent their positions after the lapse of a given time (second, hour, day, &c.), Pp is greater than Qq, and therefore the *direction* of the line pq (in which one is seen from the other) has rotated in the *opposite* direction to that in which either planet revolves about the sun. Hence, when a superior planet is in opposition (i. e., if Q be Jupiter, and P the earth), it *appears* to move backward among the stars. When an inferior planet is between the earth and sun (i. e., if Q be the earth, and P Venus), it *appears* to move backward also. If the planets be on opposite sides of the sun, as at P and R in the figure, let p and r be their positions after a given time; then pr has turned from the direction PR in the direction in which the planets revolve about the sun. Hence any planet, superior or inferior, appears to move *directly* when the sun is between it and the earth. Between these two opposite cases, there must, of course, be points at which the apparent motion is neither retrograde nor direct—then the planet is said to be *stationary*. This case occurs whenever, for an instant, the lines PQ and pq are parallel; that is, when the two planets are moving with equal velocities transverse to the line joining them, these velocities being parallel, and towards the same side of the joining line.

RETZSCH, Friedrich August Moritz, an eminent German painter and engraver, was born in Dresden, 9th December 1779, studied at the academy of his native city, where he became a professor in 1824. R. died 11th July 1857. He

acquired great celebrity by his illustrations in outline of the great German poets, Schiller, Goethe, &c.—those of Goethe's *Faust* being particularly well known, not only in his own country, but also in France and England. His illustrations of Fouqué's charming romances, *Undine* and *Sintram*, are singularly beautiful. R. likewise executed several fine works, the subjects of which are taken from the classical mythology, as 'The Child Bacchus asleep on a Panther,' 'Diana,' 'Love and Psyche embracing in the Clouds,' 'A Satyr and Nymph,' 'The Four Epochs of Human Life;' &c. Among his other works of conspicuous merit are—'The Struggle of Light and Darkness,' 'The Chess-players,' and 'Fantasies.' R. ranks as one of the most original, thoughtful, and vigorous artists of modern Germany. His works display the presence of a strong, inventive, and cultured imagination, whose efforts at expression never degenerated into a weak sentimentalism. As a miniature oil-painter, R. was also very successful.

REUCHLIN, JOHANN, also known by his Græcised name of *Capnio*, one of the first and most active promoters of Hebrew studies in Germany, whose labours and struggles in no small degree helped to bring about the Reformation, was born at Pforzheim in Baden, 28th December 1455. He received his earliest education at Schlettstadt, and in 1743, was appointed travelling companion to Prince Friedrich of Baden, in which capacity he visited Paris, made the acquaintance of the celebrated Wessel (q. v.), and studied Greek under Hermonymus of Sparta, besides assiduously practising the composition of Latin. Two years later, R. went to Basel, where he continued his study of Greek, and wrote his Latin dictionary, *Vocabularius Latinus Breviloquus Dictus* (Basel, 1478). In the same year he paid a second visit to France, studied law at Orleans (1479), and fought at Poitiers (1480), then returned to Germany, married, and set up at Tübingen as a teacher of jurisprudence and literature. Subsequently, he was raised to the rank of a count of the German empire in 1492, and about the same time began the study of Hebrew under a learned Jew, Jacob Jehiel Loans, the imperial physician. In 1496, R. went to Heidelberg, where he wrote a satirical comedy entitled *Sergius, sine Capitis Caput*, directed against the unworthy Augustinian monk Holzinger, who had been made chancellor of Würtemberg. In 1498 he was sent to Rome by Philip the Elector-palatine, and delivered a Latin oration before the pope. While remaining there, he applied himself more vigorously than ever to the study of Hebrew and Greek, and with such success, that his Greek master, Argyropulus, exclaimed in wonderment at his proficiency: 'Our persecuted Greece has taken refuge beyond the Alps.' R. returned to Würtemberg in 1499. In 1506 appeared his *Rudimenta Linguæ Hebraicæ*, a work of which he was justly proud. He made it, as he said in his preface, 'without any foreign help,' declares it to be 'the first attempt to execute a grammar of the Hebrew tongue,' and finishes with the Horatian boast, *Exegi monumentum ære perennius*. His Hebraic studies, which embraced the post-biblical Jewish literature, were—in their consequences—the most important of his life, drawing him into bitter strife with learned Jews, Jewish proselytes, and the Dominicans, and directly and powerfully helping on the Reformation. It was in the year 1510 that the struggle between Light and Darkness, as the Germans regard it, broke out. In that year, Johann Pfefferkorn, a Jewish proselyte, in the true spirit of a renegade, called upon princes and subjects to persecute the religion of his fathers, and especially urged the emperor to burn or confiscate all Jewish books except the Bible. R. remonstrated, maintaining that no Jewish books should be destroyed except those directly written against Christianity. This tolerant attitude drew upon R. the enmity of the Dominicans, and particularly the inquisitor, Jakob van Hoogstraten. These enemies of R. held possession of the universities of Paris, Louvain, Erfurt, and Mainz; but all the distinguished and independent thinkers in Germany, were on the side of the brave and humane scholar. Among the *Reuchlinists*, as they were termed, we may especially mention the names of Ulrich von Hutten (q. v.) and Franz von Sickingen (q. v.), to the first of whom (in conjunction with Rubeanus, &c.) we owe the *Epistolæ Obscurorum Virorum* (q. v.), and to the second of whom R. owed his safety, for he threatened (1519) Hoogstraten and his monks with his most terrible vengeance if they did not cease to persecute 'his teacher, Doctor Reuchlin, that wise, experienced, pious, and ingenious man.' When the Reformation was inaugurated by the burning of the papal bull (1517), R. instinctively felt that a crisis had come, and exulted in the heroism of Luther. 'God be praised!' he said: 'we have now got a man who will give them [the monks] mighty hard work.' Luther, in a letter to R. (1518), tells the latter that he had longed to take part with him in his noble struggle, but had never found an opportunity. But the end of the scholar's troubles was not yet come. A quarrel broke out between Ulrich Duke of Würtemberg and the Swabian League, in the course of which R. became a prisoner of Duke Wilhelm of Bavaria, who, however, generously restored him his freedom, and in 1520, appointed him professor at the university of Ingolstadt. While here, he received a call to Würtemberg, which he declined, but sent Philip Melanchthon in his stead. In 1522 the plague broke out at Ingolstadt, and R. again withdrew to Tübingen, intending to devote himself exclusively to learned studies, but soon after he fell sick, and died at Stuttgart on the 30th of June. R.'s life has been written by Gehres (Karlob. 1815) and Meyerhoff (Berl. 1830.)

RÉUNION, ILE DE LA, one of the names which has been borne by the island described under the head of BOURBON, ILE DE. This last name it had borne till the French Revolution, when it was called *Réunion;* in 1809 it received the name of *Ile de Bonaparte;* after the treaty of Paris (1814), it reassumed the name of *Ile de Bourbon*, and retained it till 1848, when it again took the name of *Réunion*, and by that name it still (1871) continues to be officially known.

REUS, a lively, modern manufacturing town of Spain, in the modern province of Tarragona, and 10 miles west of the city of that name by railway. It is only about 5 miles from the seaport of Salou, with which it is connected by a canal. The older portion of R. was founded as early as 1151, and consists for the most part of tortuous lanes; the modern portion consists of wide plazas and streets. The *mercado*, a sort of arcaded exchange, surrounded with shops, is the principal square. The prosperity of R. dates from about the year 1750, when a number of English merchants settled there, and developed the resources of the district. A number of the inhabitants are engaged in agriculture, but the majority are employed in the manufacture of silk and cotton fabrics, soap, earthenware, casks, leather, machinery, and in the general trade of the town. R. contains 80 establishments for cotton-spinning alone, 5000 looms, and many silk-ribbon factories. It imports flour, sheep and cattle, timber and hides, and

exports brandy, wines, nuts, almonds, oil, leather, &c. Pop. 28,100.

REUSS, the name of two sovereign principalities of Germany, between the kingdom of Saxony and the Prussian duchy of that name, and separated from each other by the circle of Neustadt, an outlying portion of the grand duchy of Saxe-Weimar. Since the year 1616, the possessions of the House of R. have been divided between the elder and the younger lines. The united area of the possessions is, according to the *Almanach de Gotha* for 1871, 445 sq. m., pop. (1867) 131,986. The principality of R.-Greiz, that of the elder line of the House of R., is 148 sq. m. in extent, and had in 1867, 43,889 inhabitants. The chief town and seat of the government is Greiz (q. v.). The principality of the younger line is R.-Schleiz, area 297 sq. m.; pop. (1867) 88,097. Chief town Schleiz (q. v.). Of both principalities, the surface is hilly, being traversed by the Frankenwald, whose chief summits are upwards of 2000 feet in height. The chief rivers are the Saale and the Elster, the valleys of which are extensive and well cultivated. Large tracts are covered with forests and in pasture, and cattle and timber are exported. For both lines, there is a kind of senate for the superintendence of common interests. The two lines had, in conjunction with several other small states, the sixteenth vote in the limited councils of the old German diet, but in the *Plenum*, the lines had, as they had also in the Federal Council, each a vote. The present sovereigns of R.-Greiz and R.-Schleiz have no civil list. They are very wealthy, the greater part of the territory over which they reign being their private property. All the princes are called Heinrich, and are distinguished by numbers beginning with each century.

REU'TLINGEN, a town of Würtemberg, situated in a beautiful district, fertile in fruit and wine, on the Echatz, a feeder of the Neckar, 20 miles south of Stuttgart. Its houses are old and picturesque; and it was formerly surrounded by walls and moats, the site of which, however, is now occupied by streets. The church of St Mary, completed in 1345, and surmounted by a pierced tower 325 feet high, which is considered the most beautiful in the kingdom, is a noble Gothic edifice. Woollen and cotton yarns are spun, and cloth, leather, cutlery, hosiery, &c., are manufactured. Pop. 13,781.

REVALE'NTA ARA'BICA, a name given to a preparation which has long been sold as an empirical diet for invalids, extraordinary restorative virtues being attributed to it. It is, in reality, only a preparation of the common lentil, its first name being formed for disguise by the transposition of its botanical name, *Ervum Lens*. Its real value is about equal to good peameal, the constituents of 100 parts of each being as follow: *Lentil Meal*, or *Revalenta*—Water, 12·70; nitrogenous matter, 24·57; starch, 59·43; fatty matter, 1·01; inorganic matter, 2·29. *Peameal*—Water, 12·60; nitrogenous matter, 25·30; starch, 58·38; fatty matter, 1·20; inorganic matter, 2·52.

REVEA'L, REVEL, the square ingoing of the sides and lintel, or arch, of doors and windows between the face of the wall and the framing.

REVEILLÉ, in an Army, is the beat of drums at break of day, to warn the troops that the night is past, and the sentries to forbear from challenging.

RE'VEL, a Russian seaport and fortress of the first rank, capital of Esthonia, one of the Baltic provinces, stands on a small bay of the same name, 238 miles west-south-west of St Petersburg. It is divided into the upper and lower towns. The former, occupying the top of a rocky ridge about a mile in circumference, is enclosed by old Gothic walls, and contains the cathedral, the castle, gymnasium, governor's residence, and the houses of the nobility. This quarter, generally called the Dom, is connected by a steep descent with the lower town, which extends to the sandy shore of the harbour. The existing walls and fortifications were erected in 1360. It was long held by the Lithuanian Order of Knights; was made over to Sweden in 1562; bombarded by the Danish and Lübeck fleets in 1569; and besieged by Peter the Great, and annexed to the Russian empire in 1710. In 1713, a naval harbour, in addition to the commercial harbour already existing, was founded. The commercial importance of the town is at present small. The chief articles of export are flax, linseed, rye, skins, corn, and potato-brandy, which are supplied by land from the governments of Esthonia, Pskov, and Livonia. The chief imports are salt, fruits, wine, and manufactured and colonial goods. Pop. 27,325.

REVELA'TION is a familiar theological expression, commonly applied to the knowledge of Himself which God has given us in Holy Scripture. In itself, however, the word is properly, and of late years has been frequently used, not merely of the divine knowledge communicated to us in Scripture, but of all divine knowledge communicated through whatever source. Conscience and reason are in themselves modes of revelation, in so far as they witness to us of the divine laws which bind our moral life, and in harmony with which the health and happiness of that life can alone be found. History is also a species of revelation, unfolding, as it does, the same divine laws collectively in the race. Then nature reveals the divine power, wisdom, and goodness; and science, the interpreter of nature, in so far as it makes known the great laws governing the material universe, truly makes known the divine will to us. But it is with the Scriptures of the Old and New Testament that the idea of revelation has come to be especially associated. The Holy Scriptures are undoubtedly in a special sense the medium of divine revelation to the human race. God has made known to us therein more fully and clearly than elsewhere His will and character. But at the same time we must not confound revelation, in its fact and essence, with the books of Scripture. These books are only the highest or most distinguished form or *medium* of revelation, which, in itself, and essentially, must always imply communication from one mind to another; and, in a religious sense, from the divine to the human mind. Scripture is, in its several books, the pre-eminent medium of this contact or interchange of the divine and human. It is the record of special communications which God made in time past to holy men, 'who spake as they were moved by the Holy Spirit.' It *contains*, in short, a revelation for us; but the revelation is not the record, but the knowledge which the record conveys to our minds.

REVELATION OF ST JOHN (*Apokálypsis Iōannou*), the last book of the New Testament Scriptures. It professes to be the production of St John, traditionally known as 'The Divine' (*ho theológos*). It has been a matter of dispute, however, whether St John, the author of this book, is the beloved apostle, the author of the fourth gospel and of the three Epistles, or not. Upon the whole, the balance of evidence and of authority seems to be in favour of the supposition that he is the same, although some distinguished names—Luther in the past, and Lücke among modern critics—have adopted the negative view of the question. The author's simple mention of himself by his name John, his description of himself as one 'who bare record of the word of God, and of the testimony of Jesus Christ, and of all things that he saw,' is held

to indicate strongly an identity with the author of the gospel, who speaks of himself in similar language (John xix. 35). He writes from Patmos, and the apostle is the only John distinctly named in the early Christian history as an exile in Patmos. The authority, moreover, with which the writer addresses the seven churches in Asia is such as may be supposed only to suit an apostle. So far as historical testimony is concerned, the authority of the early Christian Fathers—e. g., Justin Martyr, Theophilus of Antioch, and Irenæus, and Clement of Alexandria—all point to the Apostle John as the author of the Book of Revelation. The date of the book is supposed to be the very close of the 1st c. 95—97 A. D., or the end of the reign of Domitian. We cannot here particularise the contents of the book, nor can we enter into any detailed statement of the different interpretations which have been given of it. It has been the subject of very varied and conflicting commentary. It has been stated that 'not less than 80 systematic commentaries are worthy of note, and that the less valuable writings on the subject are unnumbered, if not innumerable.' All that we can do here is to characterise the different schools, so to speak, into which the interpreters of this wonderful book may be arranged: 1. The Præterist School of interpreters, who look upon the Revelation as fulfilled in the past, and especially in the great conflicts of Christianity with Judaism and Paganism, and its triumph over them in the ages following the time in which it was written. To this class of interpreters belong, among others, Grotius, Hammond, Bossuet, Calmet, Eichhorn, Ewald, Lücke, De Wette, Stuart, Lee, Maurice. 2. The *Futurist* School regard the book, with the exception of the first three chapters, as referring to events yet to come to pass; and this view has been advocated, in modern times, by such writers as Dr J. H. Todd, Dr S. R. Maitland, Newton, and others. 3. What has been called the Historical and Continuous School of expositors, who regard the Revelation as a progressive symbolic history of the fortunes of the church from the 1st c. to the end of time. To this school of interpreters belong a host of eminent names, such as Mede, Sir I. Newton, Vitringa, Bengel, Faber, Elliot, Wordsworth, Alford, Hengstenberg, Ebrard, and others.

There are others, again, who are not disposed to allow any exact prophetical character to the book, but simply to regard it as a species of symbolical poem, setting forth the eternally-recurring principles of the divine government. The real fulfilment of the Revelation, therefore, is not to be sought in any definite historical events, but in the vindication of these principles shadowed forth more or less in great historical crises, yet transcending all partial historical results. The grand symbolic imagery of the book has never found and will never find its exact counterpart in any earthly facts, but it finds its spiritual counterpart constantly in the career of the church—the unceasing conflict of truth with error, of righteousness with sin, of life with death, of the kingdom of God with the kingdom of evil, and will attain to its true realisation only on the destined triumph of the former over the latter.

REVELS, MASTER OF THE, or LORD OF MISRULE, the name of an officer, who, in England, was attached to royal and other distinguished houses, whose function it was to preside over the amusements of the court, or of the nobleman to whose house he was attached, during the 12 Christmas holidays. This officer, sometimes called *Master of the Tents and Revels*, became a permanent appendage to the English court in the reign of Henry VIII., and his duties included the keeping the tents and pavilions which accompanied the sovereign on a royal progress, as also the keeping the dresses and masks used in entertainments given at court, and the providing of new ones when required. In Queen Elizabeth's time, we find the Mastership of the Revels divided into several distinct offices. The office continued to exist till the reign of George III., when it was altogether discontinued.

REVENUE, PUBLIC. A state has a right to reserve part of the property of the citizens, or of the produce of the country, or to exact contributions from the citizens, to supply the expense of carrying on the government. It is also entitled to augment the riches of the state by taxing merchandise imported into or exported from the country, and by taking a small part of the things consumed. In the United Kingdom, this branch of the sovereign power is vested in parliament.

The revenue of the crown, in England, has been divided by Blackstone into two branches, designated ordinary and extraordinary; the former attached to the crown by hereditary right, the latter specially granted by parliament as a supply for national purposes. The so-called ordinary revenue was the more important of the two, in the early history of the country, consisting in a great measure of the rents of the crown-lands; but these came, in the course of time, to be dilapidated by alienation and improvident management; and what remains of the hereditary land and forestal revenue of the crown, is now intrusted to certain officers, called Commissioners of Woods, Forests, and Land Revenues (see WOODS AND FORESTS), who act under the control of the Treasury. From the diminution of the hereditary revenues of the crown, subsidies have become the chief source of supply, a circumstance constitutionally of great importance, as it has rendered the crown dependent on parliament for its ordinary support and existence.

The popular voice, in the matter of taxation, was admitted as early as the reign of Edward I., an act of that monarch declaring 'that no tallage or aid shall be taken or levied without the goodwill and assent of the archbishops, bishops, earls, barons, knights, burgesses, and other freemen of the land.' The laity were thenceforth taxed by the votes of their representatives. The lords spiritual and temporal voted separate supplies for themselves; and from the reign of Edward I., the clergy, as a body, granted subsidies, either as a national council of the clergy, in connection with parliament, or, at a later period, in convocation, till the disuse of this right in the reign of Charles I. As the Commons increased in political importance, the subsidies voted by them became the principal sources of revenue, and they gradually assumed their present position in regard to taxation and supply, including the lords as well as themselves in their grants. Concurrently with parliamentary taxation, imposts were formerly levied by royal prerogative alone; but none of these survived the Revolution of 1688. A grant by the Commons is not effectual without the ultimate assent of the Queen and House of Lords; the Lords, however, cannot alter a bill of supply, though they may refuse their assent to it.

The royal speech at the opening of parliament requires the Commons to make provision for the public service, and states that estimates will be laid before them. The Commons, referring to the royal speech, resolve that a supply be granted. Sitting as a Committee of Supply, they consider what specific grants shall be voted; and sitting as a Committee of Ways and Means, they deliberate on the manner in which the necessary funds shall be raised. When some progress has been made in voting the estimates, the Chancellor of the

Exchequer brings forward, in the Committee of Ways and Means, his annual statement, popularly known as the Budget, embodying his views on the probable revenue and expenditure of the year, which forms the groundwork of bills for imposing new taxes, or repealing, reducing, or continuing those that already exist. Apart from the services voted in detail by the Committee of Supply, there are some few permanent charges which the Treasury is bound to defray from the Consolidated Fund, such as the interest of the national debt, the civil list, the annuities of the royal family, and the salaries and pensions of judges and some other public officers. When taxes are imposed or altered, the government begins to levy the new duties as soon as the resolutions for that purpose are agreed to by the House. A control is established over the expenditure of the supplies by the long-established practice of separating the custody of the public revenue from the function of payment, the former being vested in the Exchequer, and the latter in the Treasury, and the officers of the Exchequer being empowered to refuse their sanction to any demand not in accordance with the determination of the legislature. By an arrangement effected by 4 and 5 Will. IV. c. 15, the public revenue is now paid into the Bank of England, to the credit of the Comptroller-general of the Exchequer, an officer independent of the ministry, who can only be removed on a joint-address to the crown from both Houses of Parliament.

The principal sources of revenue are now the customs, the excise, the stamp duties, the land-tax and assessed taxes, the property and income tax, the post-office, and the crown lands. The excise, stamps, and taxes have been placed, by 12 Vict. c. 1, under the control of a Board, called the 'Commissioners of Inland Revenue.' The aggregate of the different sources of revenue is paid into a fund called the 'Consolidated Fund,' founded by 27 Geo. III. c. 47, which is chargeable with the interest of the national debt, and is mortgaged to raise an annual sum for the maintenance of the royal household and Civil List (q. v.).

The following table exhibits the gross revenue and expenditure of the United Kingdom, in the year ending March 31, 1870:

REVENUE.

Customs,	£23,569,893
Excise,	22,605,285
Stamps,	9,545,751
Taxes { Land and Assessed,	4,551,022
Taxes { Property and Income,	10,243,342
Post-office,	4,687,261
Telegraph Service,	107,480
Crown Lands,	447,723
Miscellaneous,	3,205,252
Total revenue,	£78,960,009

EXPENDITURES.

Public Debt,	£27,077,530
Civil List,	405,941
Courts of Justice,	645,398
Annuities and Pensions,	290,405
Salaries and Allowances,	141,711
Diplomatic Salaries, &c.,	56,096
Miscellaneous Charges,	190,581
Army,	13,565,400
Navy,	9,757,290
Miscellaneous Civil Service,	9,303,014
Customs and Revenue Collections,	2,557,802
Post-office,	2,316,000
Packet Service,	1,221,552
Abyssinian Expedition,	1,300,000
Telegraph Service,	60,000
Total Ordinary Expenditures,	£68,864,752
Expenses of Fortifications,	200,000
	£69,064,752

By the budget estimates for the financial year 1870—71 the revenue was stated at £71,450,000, and the expenditure at £67,113,000.

By a Report of the Secretary of the Treasury the revenue and expenditures of the United States for the year ending June 30, 1870, were as follows:

REVENUE.

Customs,	$194,538,374.44
Internal Revenue,	185,128,859.37
Public Lands,	3,350,481.76
Miscellaneous,	28,237,762.06
	$411,255,477.63

EXPENDITURES.

Civil Service, &c.,	$69,234,017.16
Army,	57,655,675.40
Navy,	21,780,229.87
Indians,	3,407,998.15
Pensions,	28,340,202.17
Interest on Public Debt,	129,235,498.00
	$309,653,560.75

This statement exhibits a surplus applicable to the payment of the public debt, including the amount pledged to the sinking fund by the act of February 25, 1862, of $101,601,916.88.

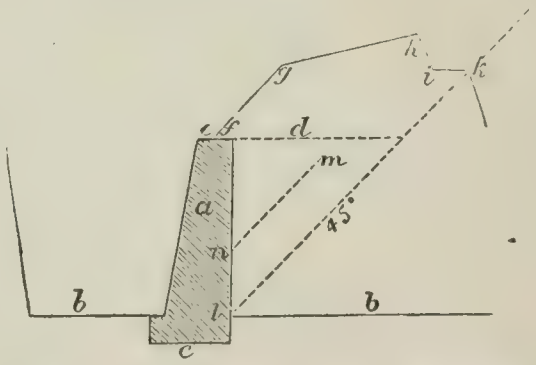
REVE'RBERATORY FURNACE, a furnace so constructed that matter may be heated in it without coming in direct contact with the fuel. It consists essentially of three parts—viz., a fireplace at one end; in the middle, a flat bed or sole, on which the material to be heated is placed; and at the other end, a chimney to carry off the smoke or fume. Between the fireplace and the bed, a low partition-wall, called a fire-bridge, is placed, and the whole built over with a flat arch, dipping towards the chimney. The flame plays over the fire-bridge, and is reflected, or *reverberated*, on the material beneath, hence the name. See LEAD (figs.).

RE'VEREND (Lat. *reverendus*, to be respected), a title of respect given to the clergy. In Roman Catholic countries, it is applied to the members of the different religious orders. In France, before the Revolution, archbishops, bishops, and abbots were alike 'Most Reverend.' In England, deans are 'Very Reverend;' bishops, 'Right Reverend;' and archbishops, 'Most Reverend.' In Scotland, the clergy in general are 'Reverend,' while it is the practice to apply 'Very Reverend' to the moderator of the General Assembly for the time being, to a synod, and to the principal of a university, being a clergyman. The General Assembly itself is usually styled 'Venerable,' but the address of the Lord High Commissioner begins with the words: 'Right Reverend and Right Honourable.'

The style Reverend is generally adopted by, and given to, the clergy of the different dissenting bodies; but there have been instances in which some of them have repudiated it.

RE'VERIE has been defined the dream of a waking man; it differs, however, in many respects; from dreaming. In an exaggerated form, it is of rare occurrence; but when exceeding absence of mind, or abstraction from what is passing around, it is abnormal and unhealthy; and may, under all circumstances, be regarded as a phenomenon of an imperfectly constituted, if not of a diseased nervous temperament. It is, moreover, generally, and always at its commencement, under the control of the will. Reverie is apparently, in all cases, an exaltation of the faculty of attention: the mind may be occupied according to the age, character, pursuits of the individual, by calculations, profound metaphysical inquiries, by fanciful visions, or by such trivial and transitory objects as to make no impression upon consciousness, so that the period of reverie is left an entire blank in memory. The most obvious external feature marking this condition is the apparent unconsciousness, or partial perception, of external objects. In what may be designated the first stage, castle-building, this inattention is only apparent, as

the surrounding scenery may enter into the illusion, and constitute a part of the romance. In the celebrated case of Hartley Coleridge, whose double life, indulged in for years, affords illustrations of voluntary creations ultimately extorting a degree of belief and expectation—from a field near his home burst forth a cataract, from which flowed a river; on the banks of this arranged themselves fertile fields, a populous region, divided into realms and kingdoms, governed by laws, having traditions, histories. 'Ejuxria' was, in fact, an analagon to the world of fact, embellished by imagination. This cherished unreality was parted with reluctantly. A more advanced stage of the affection is where, independently of the will, and in opposition to the ordinary habits of the individual, and under peculiar circumstances, there occur a loss of cognizance of surrounding objects and relations, and a state of abstraction or brown-study, in which many absurd and incongruous things are said and done. Ludicrous examples of this state are witnessed where a man loses his way in his native town, forgets his own name, or retires to bed in the middle of the day. It is related that Sir Robert Peel, utterly unobservant of the adjournment of the House of Commons, and the departure of the members, remained on one occasion unmoved in his seat, plunged in a profound reverie, until the lights were about to be extinguished, and he was roused by the clerk of the House. In a third stage or form, the reverist cannot be recalled to active perception, loses individuality, and is absorbed in the contemplation of unreal, though self-suggested impressions. This is seen in such cases as St Teresa, and in the trances of Mysticism, Quietism, Second Sight.—*Memoir of Hartley Coleridge*, Disraeli's *Life of Lord G. Bentinck*, Maury's *Le Sommeil et les Rêves*.



REVE'RSE, in Numismatics, the side of a coin or medal which does not bear the principal device or inscription. There is, however, generally an inscription or device on the reverse; and when the lower part of it is markedly separated from the rest, it is called the EXERGUE (Gr. *ex ergou*, without the work), and bears a secondary inscription.

REVERSED, in Heraldry. A term applied to a charge turned upside down.

REVE'RSION. When the enjoyment of money, or of any kind of property, is postponed until, or contingent on, the happening of a given event or given events, the present right to the deferred benefit is called a reversion. When the emergence of the right is certain, and the date fixed, to ascertain the immediate or marketable value of a reversion, is a very simple calculation; for example, let it be required to know for what sum a man should sell the right to receive £100 payable ten years hence. Suppose that he expects to be able to improve the money for which he sells his right at five per cent. per annum, compound interest, then one obvious way to get an answer to the question is simply to calculate what sum annually accumulated at the assumed rate will in ten years amount to £100. The answer (see art. INTEREST) will be found to be £61, 7*s*. 10*d*. When the date of the emergence of the reversionary right is uncertain, the purchase, in an individual case, must always be a speculation; but if there are a sufficient number of such rights, postponed to events of which there are sufficient observations from which to deduce laws of average, then the marketable value is easily calculated: for example, it is required to know what is the immediate value of £100 payable certainly on the death of a man aged 60. Here the perpetuity divides itself into the present value of an annuity of the annual interest of the £100 on the life of a male aged 60, and the reversionary right which is to emerge when the life fails. Having then ascertained the former value, and deducted it from £100, the remainder will be the present value of the reversion. When an assurance company buys a reversion, it is simply buying that which it sells when it grants a policy of life assurance. In the former case, however, an office, to secure its expenses and profits, will assume a high rate of interest and a long life; in the latter case, for the same reason, it will assume a low rate and a short life. Where the reversion is contingent, problems arise whose solution requires the utmost skill on the part of the actuary; for instance, B, aged 30, wishes to borrow £100 on the security of a sum payable to him *in the event* of his surviving A, aged 58. Here the security being doubtful, it could only be rendered marketable by assuring a sum to be paid in the event of B dying before A; and there would remain the important question of what this sum should be, so as to cover the loan and the premiums of assurance with yearly accumulations on both. This question will be found ably discussed in a paper by Mr Lang in the *Assurance Magazine* for 1850, p. 18.—On the general subject, see the same work for 1851, paper by C. Jellicoe, Esq.; do. for 1855, p. 239, paper by Robert Tucker, Esq.

REVERSION is that right to property which remains after some particular estate has ceased which had been granted by the owner. Thus, if A has a life estate in B's property, and after he dies, the property returns to B, B is said to have the reversion, or to be the reversioner. The landlord of property let to a tenant is called the reversioner, because, the moment the lease determines, the whole of the property and possessions vest in him. In the sale of reversionary estates, owing to the want of a system of registration of deeds, great risk is incurred by the purchaser lest the property should be burdened by some rent-charge.

REVÊTMENT, in permanent Fortification, is a retaining-wall of masonry built for the purpose of holding back the earth of which works are composed. The most ordinary position of revêtments

ac, revêtment; *b*, bottom of ditch, level of ground within the work; *de*, top of rampart; *fgh*, parapet; *ik*, banquette; *kle*, mass of earth supported by revêtment; *m*, centre of gravity of mass; *n*, point of greatest pressure on revêtment.

is for the escarp and counterscarp of the ditch (see FORTIFICATION). The most important of these two is the escarp, which has to hold back the great mass of earth represented by the rampart, parapet, banquette, &c. It is usually of solid brickwork or stone, 5 feet thick at the top, and sloping outwards as it descends (on the ditch-side only) to the extent of 1 in 6. Prior to Vauban's time, the escarp revêtment was commonly raised to the top of the parapet; but as in this case the artillery of a besieger played on the top of the wall, and ruined it soon after the siege commenced, that engineer

adopted the principle—thenceforth followed—of raising it no higher than the crest of the glacis, or about 7 feet above the natural ground, leaving the parapet above of sloped earth only. When the main ditch is 24 feet deep, the scarp revêtment will be about 30 feet high. Additional strength is imparted to the revêtment wall by massive buttresses at every 15 feet, called *counterforts*, and these, again, are sometimes connected and strengthened by masonry arches outside the revêtment. The revêtment forms a terrible barrier to an assaulting party. In field-works, temporary revêtments may be made of timber, turf, hurdles, or any other materials at hand.

REVIEW', in Military parlance, is the inspection by the sovereign or some staff-officer of any body of troops in parade order. Reviews always comprise a march past the inspecting-officer in column, and a general salute in line; to these is frequently added a mock-battle, for the amusement of spectators, and the practising of the troops themselves in warlike manœuvres.

REVIEW. The name applied by common literary usage to such periodical publications as are made up of critical essays. See PERIODICAL.

REVI'SING BARRISTER is a barrister appointed annually by the English judges to revise the lists and settle who are the persons entitled to vote for members of parliament. For this purpose, all England is subdivided into districts, and a barrister is appointed for each district by the judges of assize. Though the appointment is only for one year, yet practically the same person is reappointed for life. The barrister must be of three years standing at least. The revision of the lists takes place generally between August and October of each year. There is an appeal from the decision of the revising barrister to the Court of Common Pleas at Westminster.—Similar duties are performed in Scotland by the sheriff-substitute.

REVI'VOR is a bill or writ by which a suit or action is kept alive in the English courts of equity or law, where one of the parties dies during its dependence.

REVOCA'TION, when used as a legal term, is the withdrawing or annulling of a deed or will which otherwise would be valid. A will is said to be always subject to revocation, even though the testator say in the most express language that it is not to be revocable, because a will is supposed to be subject to the ever-varying occasions of life. On the other hand, a deed is not capable of revocation, and is in its nature final and irrevocable; but if an express proviso is inserted which reserves a power of revocation, then this is a valid power, and may be exercised, provided the directions of the deed are strictly followed.

REVOLU'TION, in Politics, any extensive change in the constitution of a country suddenly brought about. The two most important events in modern history known under this name are the English Revolution of the 17th c., and the French Revolution of the 18th. The former began in the early part of the reign of Charles I., with the struggle between that king and his parliament. In 1642, the struggle became a civil war, in which the parliament obtained the ascendency, and brought Charles to the block in 1649. A republic followed, under the Protectorate of Oliver Cromwell, which was succeeded in 1660 by the Restoration of monarchy in the person of Charles II.; but the arbitrary rule of James II. brought the king and people again into antagonism; and James having fled the country, William III. was called to the throne under such conditions and safeguards as secured the balance of the constitution.—The French Revolution was a violent reaction against that absolutism which had come in the course of time to supplant the old feudal institutions of the country. It began with an outbreak of insurrectionary movements at Paris in July 1789, including the destruction of the Bastille. On the 21st January 1793, King Louis XVI. was beheaded. The Christian religion was deposed, the sacredness of the Republic and worship of Reason solemnised, and a disastrous reign of blood and terror followed, which was brought to an end in 1794, when Robespierre himself suffered on the guillotine the fate to which he had condemned countless multitudes of his countrymen.

Among other important revolutions in the modern world are the American Revolution of 1775, by which the United States threw off their dependence on Great Britain; the French Revolution of 1830, which drove Charles X. into exile, and raised Louis Philippe, Duke of Orleans, to the throne by the will of the people; as also the Revolution of 1848, when France rose against Louis Philippe, and adopted for a time a republican form of government, the revolutionary contagion spreading temporarily over most of continental Europe. By the Italian Revolution of 1859—1860, the various minor sovereigns of Italy were driven into exile, and the whole of the peninsula, with the exception of the Roman and Venetian territory, became subject to the constitutional sway of Victor Emmanuel, formerly king of Sardinia, and now of Italy.

REVOLU'TIONARY TRIBUNAL, the name specially given to the infamous court of judgment—the most extreme republican will scarcely affirm that it was a court of justice—instituted by the French Convention in March 1793, on a motion made by Danton (q. v.), who considered that such a court had become necessary, inasmuch as the recent disasters that had befallen the national armies on the frontiers had led to dangerous conspiracies against the revolutionary government. Its members were chosen from the various departments, and their appointment was ratified by the Convention. Their function was to sit in judgment on all persons accused of crimes against the state, and from their sentence, delivered with appalling promptitude, there was no appeal. During the 'Reign of Terror,' when Fouquier-Tinville (q. v.) was 'public accuser,' it acquired a horrible notoriety, abolishing soon almost all forms of justice, neither hearing witnesses on behalf of the accused, nor allowing him an opportunity of defence, but blindly executing the orders of the 'Committee of Public Safety,' which was merely a tool in the hands of Robespierre (q. v.).—In the provinces, similar tribunals, under the name of 'Revolutionary Committees,' were established, the commissaries-general of which, as, for instance, Carrier (q. v.), shot or drowned *suspects* in crowds.

REVO'LVER, in Firearms, is a weapon which, by means of a revolving breech, or revolving barrels, can be made to fire more than once without reloading. The invention is very far from new, specimens, with even the present system of rotation, being still in existence, which were manufactured at the beginning of the 17th century. Probably the first revolver to suggest itself was one in which several barrels were mounted on an axis, and made to revolve by the action of the trigger, so that their powder-pans came successively under the action of the lock. This principle was never entirely abandoned, and in the reign of George IV. was produced a pistol called the 'Mariette,' which had from four to twenty-four small barrels bored in a solid mass of metal, made to revolve as the trigger

was drawn back. At close quarters, such a pistol would doubtless have been useful; but its great weight and cumbrous mechanism rendered aim extremely unsteady.

Contemporaneously from the first with the revolving barrels, went the formation of a revolving chamber or breech, pierced with several cylindrical apertures to receive the charges. Being made to revolve, each motion brought a chamber into line with the one barrel, common to all, whereupon the weapon was ready for use. Numerous patents for this principle have been taken out, including one by the celebrated Marquis of Worcester in 1661. Various improvements were made, especially in the mode of causing revolution, an American, of the name of Elisha H. Collier, patenting such a weapon in the United States and England about 1818. In 1835, Colonel Samuel Colt brought to a conclusion experiments of some years' standing, and patented his world-renowned Colt's Revolver, which was a great advance on all previous attempts, and is substantially still in use. Colt's revolver consists of one rifled barrel of considerable strength and a massive chamber perforated with six or seven barrels, which are brought into a line with the barrel by action of the trigger. Each chamber has its nipple for a cap, which is brought under the hammer by the motion which brings the chamber or breech-piece round. The hammer is discharged by the trigger, and acts nearly horizontally in a forward direction. Under the pistol is a fixed lever-ramrod, which is used in loading the chambers. This mechanism enables a combatant to be on a tolerably fair footing with a party who have the command of six single-barrel guns. Besides all this, by withdrawing a bolt, which can be done in a moment, the entire breech-piece can be taken out, and replaced by another ready charged, so that, by carrying a spare breech-piece, a person may fire twelve shots in less time than another could fire three if he had to load between the shots. Colt's revolvers are now extensively used in the naval and military services of America and Europe.

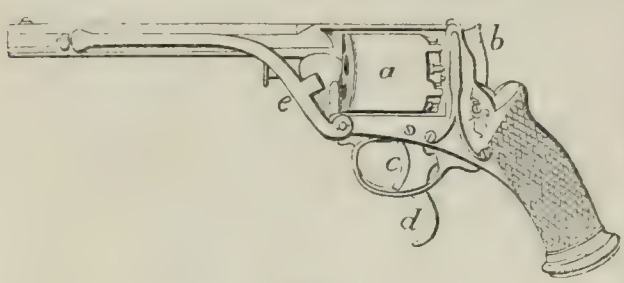


Fig. 1.

a, the chamber; *b*, hammer; *c*, trigger; *d*, spur for raising the hammer; *e*, lever-ramrod.

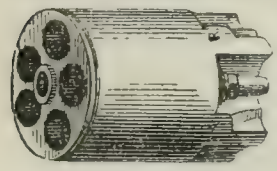

Fig. 2.—Chamber with five barrels.

The principal rival of Colt's Revolver has been the Deane and Adams' Revolver, although many more of various sorts have been patented in the interval. The 'Deane' differed in that it could be fired by merely pulling the trigger without also raising the hammer with the finger, as in Colt's; but this was found to be so dangerous in practice, that the inventors soon substituted an arrangement under which it could be fired either by the trigger or by raising the hammer; and lastly, they introduced the great improvement of a spur behind the trigger, which must be pressed by the middle finger, while the forefinger discharges the piece through the trigger. The revolver principle has not been extensively applied to muskets or rifles, breech-loaders having thus far been preferred. The breech-loader of Jarre & Co. of Paris is a magazine-gun on the Colt principle, and is capable of being fired 50 times a minute. The formidable weapon known as the Mitrailleuse (q. v.) or Gatling gun is similarly constructed, and is a revolver cannon.

In the manufacture of portable fire-arms the United States inventors bore the palm at the Paris Universal Exhibition of 1867. Among the minor arms were Colt's revolvers, and numerous breech-loading rifles known as the Berdan, Peabody, Remington, Roberts', Smith and Wesson, Spencer, Ball, Snider, Sharp, &c. See NEEDLE-GUN, also BREECH-LOADING ARMS, in SUPPLEMENT, Vol. X., Norton and Valentine's *Rep. on Munitions of War at Paris Exhib.*, 1867.

REVU'LSION, in Medicine, a term synonymous with DERIVATION (q. v.). See also COUNTER-IRRITANTS.

REWARD, when used in a legal sense, means a sum of money awarded by a court or judge to a witness who has been instrumental in detecting crime. By an English act of parliament of 1827, whenever it appears to a court of assize that a person has been active in apprehending offenders charged with murder, or with feloniously shooting, stabbing, cutting, wounding, or poisoning, or with rape, burglary, housebreaking, robbery, arson, or cattle-stealing, or with receiving stolen goods, the court may order the sheriff of the county to pay to such person a sum of money, to compensate his expenses, exertions, and loss of time. So courts of quarter sessions may order a reward not exceeding £5. If any man happen to be killed while endeavouring to apprehend a criminal charged with any of these offences, the court may also order a sum to be paid to the widow or child. The going to foreign countries to apprehend criminals, is not considered to be a proper ground for giving these rewards. Nor is ordinary stealing from the person a crime which is within the act. Sometimes persons whose property has been stolen inconsiderately offer a reward for its restoration, and persons offer to recover it for a sum of money. The following enactments of the statute 24 and 25 Vict. c. 96, are directed against this practice. Whoever corruptly takes any money or reward, directly or indirectly, under pretence of helping any person to any chattel, money, valuable security, or other property which shall have been stolen, embezzled, or illegally disposed of, shall be guilty of felony, and be liable to penal servitude for seven years, or imprisonment for two years. A person may commit this offence though he has no knowledge of or connection with the thieves. Moreover, whoever shall publicly advertise a reward for the return of any property stolen or lost, and shall in such advertisement use any words purporting that no questions will be asked, or that a reward will be given, without seizing or making any inquiry after the person producing such property, or shall offer or promise to return to pawnbrokers or others any money advanced on such stolen or lost property, shall forfeit £50; and whoever shall print or publish such advertisement, shall forfeit the same sum.

REWARDS FOR DISTINGUISHED MILITARY SERVICE are annuities — most commonly of £100 each — granted to meritorious officers in consideration of distinguished service. The officers to whom they are awarded are usually major-generals or colonels, though a few quartermasters and subalterns receive these annuities, which, however, in their case rarely amount to £100. The officer holds the annuity until, being a general officer, he is appointed colonel of a regiment. The

total amount thus expended in 1864–1865 was £15,495, exclusive of £4400 divided among meritorious sergeants in annuities of £10, £15, or £20 each.

REY'KIAVIK. See ICELAND.

REYNARD THE FOX, the title of a celebrated epic fable of the middle ages, belonging to, and terminating the series of poems in which 'beasts' are the speakers and actors. It is written in Low-German, professedly by a Hinreck van Alckmer, 'schoolmaster and tutor of that noble virtuous Prince and Lord the Duke of Lorraine,' and was printed at Lübeck in 1498, under the title of *Reineke Vos;* but German critics in general are disposed to believe that no such person as Hinreck van Alckmer ever existed—he is nowhere else mentioned in history, literary or otherwise—and that the real author is a Hermann Barkhusen, town-clerk and book-printer in Rostock, who, according to a common enough practice, sent his book into the world under a pseudonym. A Rostock edition appeared in 1517, which was long believed to be the earliest, until the discovery of a copy—the only one known to exist—of the older Lübeck edition in the Wolfenbüttel Library by Professor Hakemann, who published it in 1711. Since then, the work has been repeatedly republished in Germany—the best edition being that of Hoffmann von Fallersleben (Bresl. 1834; 2d edit. 1852), which is enriched with an 'Introduction,' 'Notes,' and 'Glossary.'—At a comparatively early period, translations were made from the Rostock edition into High-German, that of Mich. Beuther (Frankf. 1544), though badly executed, passing through more than 20 editions. The High-German translation was retranslated into Latin verse by Hartmann Schopper (Frankf. 1567), and thus gradually found its way into other countries. Goethe translated the work anew into modern German hexameters with admirable spirit and freshness (Berl. 1794), and his translation has been charmingly illustrated by Kaulbach (Mun. 1847): later translations are those by Soltau (Berl. 1803) and Simrock (Frankf. 1845—1852), both of which are executed in the measure of the original—i. e., rhymed iambic couplets. A Danish translation in verse by Herm. Weiger was published at Lübeck in 1555; a Swedish, at Stockholm in 1621—prose version, 1775.

This brief outline of the literary history of *Reineke Vos*, leads us to the second and even more important part of the subject. Was that work strictly an original product of the author's fancy, or was it merely the final form assumed by a widespread fable? Till Jakob Grimm published the results of his laborious researches, everybody supposed that the poem printed at Lübeck in 1498, by whomsoever composed, was the earliest literary embodiment, if not the direct source, of the fable; but that opinion is no longer tenable. Grimm has shewn that, in one form or another, the 'beast-fable' (Ger. *Thier-sage*) goes back to the remotest antiquity, and is a common inheritance of the Aryan or Indo-Germanic races—Hindus, Celts, Greeks, Romans, Slaves, Esthonians, Germans—and even the Finns; and he explains with great clearness the conditions of thought, intellectual and religious, under which such a literary form is developed. But all nations do not attain equal success in its cultivation, and it was among the Germans, particularly the Franks, that it attained its most complete poetical elaboration. Grimm is, however, inclined to think that the particular fable of *Reineke Vos* is of German rather than Oriental origin (although the Persian version of Pilpay's fables, entitled *Anvár-i Suhaili*, or the Lights of Canopus, translated by Mr Eastwick, Hertford, 1854, contains a story strikingly similar), and that the Franks brought it with them to the Netherlands and to France, where (and not in Low-Germany) it first appeared. Grimm published, in the *Lateinische Gedichte des* 10 *und* 11 *Jahrh.* (Gött. 1838), some small pieces, containing the nucleus or germ of the fable, and shewing how soon, in the hands of the verse-loving monks, it had been turned to didactic and satiric purposes. Somewhat later, other stories make their appearance, bearing more or less on the history of Reynard, but none of them setting forth the fable in the same manner as we now have it—the two principal being *Isengrimus* (apparently the composition of an ecclesiastic in Southern Flanders about the beginning of the 12th c., and containing two stories of the wolf) and *Reinardus* (also originating from a Flemish ecclesiastic named Nivardus, which, besides an expansion of the *Isengrimus*, contains ten new stories; its date is about half a century later). But while, in these clerical compositions, side-allusions to the papacy, to the discipline of the church, and to the then powerful and flourishing order of the Cistercians, are very noticeable, in the mouth of the Franco-Flemish people, on the other hand, the story kept itself free of such temporary phenomena, and gradually shaped itself into a style of pure epic satire, reflecting general human characteristics. Before the close of the 12th c., this purer and more epic form of the satire found its way into both German and Flemish literature. In the former, this happened about 1170, when Heinrich der Glichezare (i. e., Henry 'the Feigner' = Inventor or Troubadour), a native of Alsace, wrote in High-German his *Isengrines nôt;* and again in Flemish, a little later, when a poet, whose name is scarcely known, wrote *Der Reinaert*, a work of the purest epic character, and far surpassing all its predecessors both in conception and execution. Both works were afterwards redacted by unknown hands—the German, about the beginning of the 13th c., when its redactor gave it the title of *Reinhart* (published by Mailáth und Köffinger, in the 'Koloczaer Codex,' Pesth, 1818; and again in a purer state, with all his valuable historical investigations, by Jakob Grimm, *Reinhart Fuchs*, Berl. 1834); the Flemish, about the close of the 13th c., when it received the name of *Reinaert de Vos*, part of which appeared in Grimm's *Reinhart Fuchs*, but the whole of which was published by J. F. Willems (Ghent, 1836—1850), at the expense of the Belgian government.—Meanwhile, in France, the number of poems in which fables about Reynard are set forth had mightily increased, but only the oldest among those which have survived (which only reach back to about the beginning of the 13th c.) display a pure epic character. In 1826, M. Méon published a collection, in 4 vols., of the stories extant in Norman-French, under the title of *Le Roman du Renart*, to which M. Chabaille, in 1835, added *Supplémens*, with various readings and corrections. The *Renart li Contrefet*, of an unknown poet of Champagne, has only been partially printed. From such sources sprung the French chap-books (*Volksbücher*), which came into vogue after the 15th century. How popular the fable became in France may be estimated from the fact, that the German word Reinhart (old form, *Raginohart*—i. e., 'bold' or 'cunning in counsel'), which merely designates the character of the Fox, has entirely superseded the old Franco-Latin word *goupil* (from the Latin *vulpes*). The Swabian court-poetry of Germany had little in harmony with the 'beast-fable,' which was little cultivated while the former continued to flourish. In the Netherlands, on the other hand, it continued

to keep its ground, but as the medieval spirit of poetry declined, it passed into prose—e. g., *De Hystorie van Reinaert de Vos*, published in Dutch at Gouda, in Holland, in 1479; which, in its turn, was translated into English in 1481 by William Caxton —*Hyer begynneth thystorye of Reynard the Foxe;* republished, with a few changes, by W. J. Thoms (Lond. 1844).—Thus have we sketched in meagre outline the history of the fable of Reynard the Fox in different countries, and from internal evidence it is clear, that the substance of the Low-German *Reineke Vos* of Hinreck van Alckmer or Hermann Barkhusen was derived from the Flemish sources already referred to. Its peculiarity consists in this, that it is the latest, best, and most complete of the whole series of poems about the Fox, gathering up into itself, as it were, whatever scattered merits its predecessors possess, and presenting the whole in epic unity for the pleasure and profit of all future ages. The work now consulted by general readers is Goethe's version, of which an excellent translation into English heroic verse was made by T. J. Arnold, with illustrations by J. Wolf (Lond. 1855). For a critical appreciation of the fable, see Carlyle's 'Essay on German Literature of the Fourteenth and Fifteenth Centuries' (*Miscellaneous Essays*).

REYNOLDS, Sir Joshua, P.R.A., is generally acknowledged to be at the head of the English school of painting; he was born on 16th July 1723. His father was the Rev. Samuel Reynolds, rector of Plympton, St Mary, and master of the grammar-school of Plympton, Devonshire. He intended his son for the medical profession, but Joshua having manifested from an early age an ardent desire to be a painter, was, in 1741, placed under Hudson, the principal portrait-painter of the day. After being in the studio of this artist two years, he commenced on his own account as a portrait-painter at Plymouth Dock, now Devonport, and met with great encouragement. In 1746, he went to London, and established himself in St Martin's Lane; but on the appointment of Commodore Keppel to the Mediterranean station, he accepted an invitation to accompany him, sailed from Plymouth in 1749, and on his arrival in Leghorn, proceeded to Rome. He remained about three years in Italy, most diligently employing his time in visiting the various cities where the chief art-collections are to be found. On his returning to London in October 1752, his works attracted great attention, eclipsing everything that had been done there since Van Dyck's time. When the Royal Academy was instituted in 1769, he was elected President; was knighted by George III., and on Ramsay's death, in 1784, succeeded him as painter to the king. He died in his house in Leicester Square on 23d February 1792, and after lying in state at the Royal Academy, was interred in the crypt of St Paul's. Sir Joshua lived in friendly intercourse with Johnson, Burke, and the leading men of his period. His literary works consist of fifteen Discourses delivered in the Royal Academy; three essays contributed to the *Idler*, at Dr Johnson's request; notes to Mason's translation of Du Fresnoy's *Art of Painting;* a few notes for Dr Johnson's edition of Shakspeare; and notes of his tour through Flanders in 1781. In his writings, there is much valuable information on art, imparted in an admirable manner; but he has been charged with laying down in them various rules, and holding up the works of certain schools as models for the student, while he himself did not carry out these precepts in his practice as an artist; and from this an unfair inference has been drawn, that from love of gain he cultivated portrait-painting, the most lucrative branch of the profession, and recommended others to follow what is generally believed to be a more arduous but less remunerative path of art. But this accusation is most unjustly made—perhaps no other artist has handed down in writing so many practically useful maxims and observations on art. His works of this kind fortunately are numerous, and bear a very high value. There are nearly 700 engravings from R.'s pictures; most of them admirably rendered in mezzotint.—Northcote's *Life of Sir Joshua Reynolds* (Lond. 1819); Cunningham's *Lives of British Painters, Sculptors, and Architects* (Lond. 1854); and C. R. Leslie's *Life and Times of Sir J. Reynolds* (1865).

RHABDOSTE'US, a remarkable genus of Cetaceans discovered by Cope in the Miocene formation of Maryland, characterized by having the bones of the upper jaw prolonged into a slender cylindric beak three feet in length in the species *R. latiradix*. Teeth existed only at its base. It probably had a distinct neck, and is allied to the *Platanista* of the Ganges. Gill erects it into a distinct family.

RHADAMA'NTHUS, a mythical personage, son of Zeus and Europa, and brother of Minos (q. v.). He settled in Bœotia, where he married Alcmene. So great was his reputation during life for the exercise of justice, that after death he was appointed a judge in the under-world, along with Minos and Æacus. His special function was to sit in judgment on the actions of all those who came to Hades from Asia.

RHÆTIC BEDS, a series of strata forming the uppermost portion of the Trias (q. v.), which are extensively developed in the Rhætian Alps. The British beds referred to this group are more highly fossiliferous than any of the other members of the Triassic period.

RHAMNA'CEÆ, a natural order of exogenous plants, consisting of trees or shrubs; often spiny; with simple, generally alternate leaves, and stipules minute or wanting. The flowers are small, generally green. The calyx is 4—5 cleft; the petals distinct, hood-shaped, or convolute, inserted into the throat of the calyx, occasionally wanting. The stamens are equal in number to the petals, and opposite to them; the disc is fleshy; the ovary is superior, or half-superior, with two, three, or four cells; the ovules solitary. The fruit is fleshy, and does not open when ripe, or dry and separating into three parts. This order contains about 250 known species, natives of temperate and tropical countries, and very generally distributed over the globe. Some of them are used in dyeing (see Buckthorn and French Berries), some in medicine (see Red Root), and the fruit of some is pleasant (see Jujube); whilst *Hovenia dulcis*, a native of China and Japan, is remarkable for the thickening of its flower-stalks after flowering, so as to form a succulent sweet red pulp, with a flavour resembling that of a pear.

RHAMPSINITUS, the Greek name of the Egyptian monarch Rameses III., first king of the 20th dynasty, and builder of the great palace at Medinat Habu. According to Herodotus, he placed two colossal statues of 25 cubits high in front of the west vestibule of the Hephæsteum at Memphis. He was the richest of Egyptian kings, having amassed 400,000 talents, or £77,500,000—an incredible sum for that period. This wealth was, however, probably in jewels as well as the precious metals, for both are recorded on the walls of the treasury of Medinat Habu. To secure this enormous treasure, he built a treasury of stone, one side of which adjoined the wall of his palace. In connection with this, is narrated a story which rather resembles the tale of Ali Baba in the *Arabian Nights* than the sober narrative of history. R. is said to have descended to

Hades, and to have played at draughts with Isis, or Ceres; and he is so represented on the walls of his palace at Medinat Habu. His return was celebrated as a festival. Herodotus, who has inverted and confused the whole history of Egypt, calls R. the son of Proteus, and predecessor of Cheops, placing him 16 dynasties earlier than he should be. Lepsius dates his reign about 1275 B. C. According to Diodorus, R. was called Remphis, or rather Rempsis (Ramses), and by Pliny, Ramses, in whose reign Troy was taken.

Pliny, *Hist. Nat.*, xxxvi. 8, 14, 2; Herodotus, ii. 121—124; Diodorus, i. 62; Champollion, *Not. Descr.*; Burton, *Exa. Hier.*; Sir G. Wilkinson, *Manners and Customs*, i. p. 121, and foll.; Lepsius, *Einleit*, p. 299, and foll.

RHA'PSODISTS (from Gr. *rhapto*, to string together, and *odē*, a song), in ancient Greece, were a class of persons who earned their bread by going about from place to place, reciting, in a sort of musical chant, the epic ballads of Homer and other ancient poets. They may be compared with the wandering minstrels of the middle ages; but there is this important difference, that the latter were generally the authors of the compositions which they sung. The R. were long a respected and venerated body, but lost their importance, and consequently their character, when the Homeric songs, after being written down, and perhaps woven together into their present form by the scholars at the court of Peisistratos, became generally known to the Greek world through the medium of manuscript copies. Each ballad, or at least as much as could conveniently be remembered and recited at one time, was termed a 'rhapsody,' whence the application of the term to the separate books of the *Iliad* and *Odyssey*, in which usage it is equivalent to the *Fytte* or *Canto* of Scott and Byron.

RHATANY ROOT. See RATTANY ROOT.

RHE'A. See NANDU.

RHEEA FIBRE—RAMIE—CHINA GRASS, is a valuable fibrous material produced by a species of nettle, *Boehmeria nivea*. It has been introduced into the Southern United States from the East Indies, and its cultivation has been entered upon on a large scale. It is of great value as a textile fibre, as it is stronger than hemp, with the lustre of silk. Its success as an American staple must depend upon the economy of production and the skill with which it is prepared for the hands of the weaver. See *Rep. of Com. Agricult.*, 1867 and 1869. See BOEHMERIA, CHINA GRASS.

RHEIMS, or **REIMS**, a city and archiepiscopal see in the department of Marne, France, situated on the Vesle (a tributary of the Aisne), 107 miles east-north-east of Paris, by the Paris and Strasbourg Railway. R., a very ancient city, is built on the site of *Durocortorum*, which is mentioned by Julius Cæsar (*De Bello Gallico*, vi. 44) as the capital of the Remi, from which people it subsequently took its present name. Christianity may have found an entrance into R. at an earlier period, but it was not till the middle of the 4th c. that it became a bishop's see. Under the Frank rule it was a place of much importance, and it acquired a deeply religious interest from its having been the scene of the baptism of Clovis and his chief officers by the bishop, St Remy, in 496. In the 8th c., it became an archbishopric, and from the 12th c. (in 1179, in which year Philip Augustus was there solemnly crowned), it became the place for the coronation of the kings of France down to the time of Charles X., a vessel of sacred oil, called *la Sainte Ampoule*, to which a miraculous origin was ascribed, being preserved for the purpose. The only sovereigns in the long series, down to the Revolution of 1830, not crowned at R. were Henry IV., Napoleon I., and Louis XVIII. During the frenzy of the Revolution, the cathedral was attacked by the populace, and the sainte ampoule destroyed, in detestation of royalty; and in 1830, the ceremony of coronation at R. was abolished. R. is one of the principal entrepôts for the wines of Champagne, and the hills which surround the town are planted with vineyards. It is one of the great centres of the woollen manufacture in France, and its manufactures, embracing woollen goods, mixed fabrics in silk and wool, merinoes, &c., are known in commerce as *Articles de Reims*. The town is well built, and from the material employed in building, which is the chalk-stone of the district, and from the prevalence of the older style of domestic architecture, has a picturesque appearance. Its most striking public building is the cathedral, which, although it still wants the towers of the original design, is one of the finest extant specimens of Gothic architecture. It was built in the first half of the 13th century. Its nave is 466 feet long by 99 in breadth, with a transept of 160 feet, and the height is 144 feet. Its grandest features are the western front, which is almost unrivalled, and the so-called Angel Tower, which rises 59 feet above the lofty roof. The stained glass is remarkable for its beauty; the baptismal fonts also are of exquisite workmanship, and the organ is reputed one of the finest in France. The church of St Remy is of greater age, and nearly of equal size, but it is of less architectural pretension. The archiepiscopal province of R. comprises the sees of Soissons, Chalons, Beauvais, and Amiens. Pop. 55,808.

RHEI'NGAU, a district stretching along the right bank of the Rhine, formerly belonging to the archbishopric of Mainz, now forming the south-west portion of the Prussian province Hesse-Nassau, is about 12 miles long, and 6 broad. The principal town is Elfeld, with about 2500 inhabitants. This district, one of the richest in Germany, protected by mountains from the north and east winds, and exposed to the mid-day sun, produces wines of the best quality.

RHEIN-HESSE. See HESSE-DARMSTADT.

RHE'NISH ARCHITECTURE, the style of the countries bordering on the Rhine when the arts first revived after the fall of the Roman empire. Being, at the time of Charlemagne, part of the same empire with Lombardy, the arts of that country (see LOMBARD ARCHITECTURE) soon spread northwards, and similar buildings sprung up north of the Alps. There are almost no traces of architecture in Germany before the time of Charlemagne. It received great encouragement from him and his successors, and the Rhenish style made great progress up to the beginning of the 13th c., when the fashion of copying the Gothic architecture of France superseded it. It is, however, a well-marked style, and is complete and perfect in itself. Like the Lombard style, it is round-arched, and has some

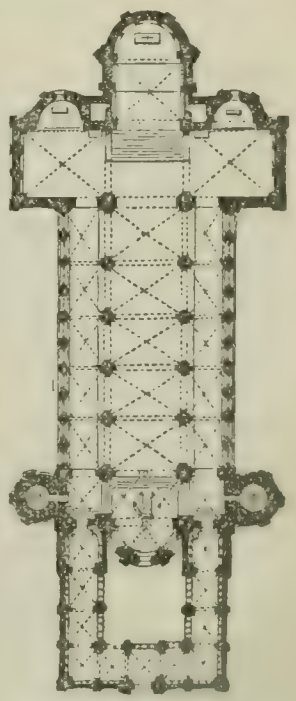

Fig. 1.—Plan of Church at Laach.

remarkable peculiarities. The earliest churches seem to have been all circular (like the Dom at Aix-la-Chapelle, built by Charlemagne), and when this was abandoned, the circular church was absorbed into the Basilica, or rectangular church (see ROMANESQUE ARCHITECTURE), in the form of a *western* apse. Most German churches thus have *two apses*—an eastern and a western. They also have a number of small circular or octagonal towers, which seem to be similar in origin to the Round Towers of Ireland. They exemplify in a remarkable manner the arrangements of an ancient plan of the 9th c., found in the monastery of St Gall, and supposed to have been sent to the abbot, as a design for a perfect monastery, to aid him in carrying out his new buildings. The arcaded galleries at the

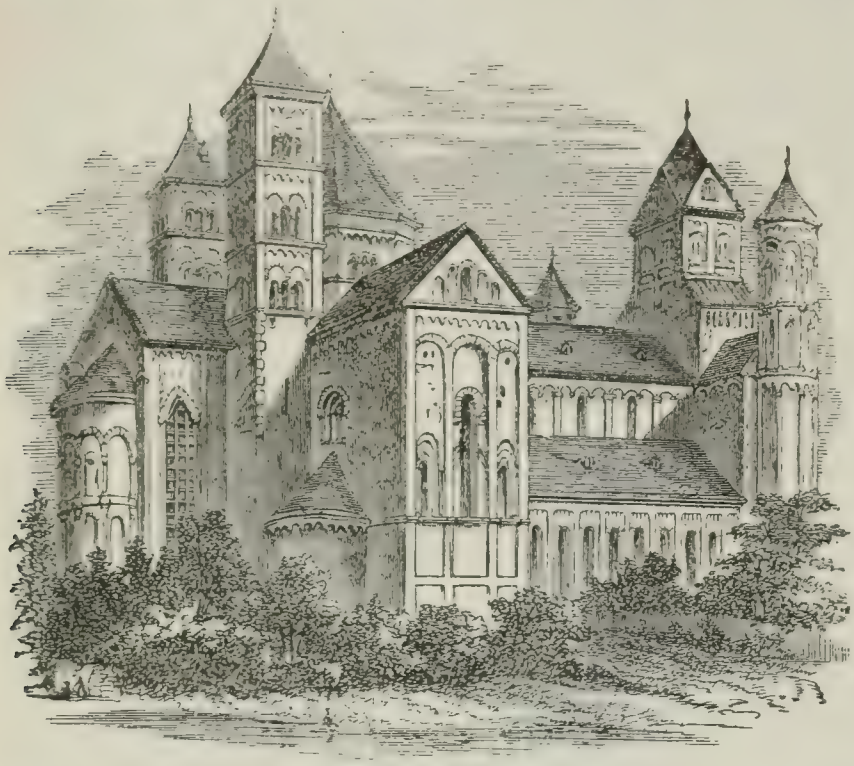

Fig. 2.—Elevation of Church at Laach.

eaves, and the richly-carved capitals, are among the most beautiful features of the style. Examples are very numerous from about 1000 to 1200 A.D. The three great types of the style are the cathedrals of Mayence, Worms, and Spires. The last is a magnificent building, 435 feet long by 125 feet wide, with a nave 45 feet wide, and 105 feet high. It is grand and simple, and one of the most impressive buildings in existence. There are also numerous fine examples of the style at Cologne—the Apostles' Church, Sta Maria in Capitulo, and St Martin's, being amongst the most finished examples of Rhenish architecture. The illustrations of the church at Laach explain the peculiarities of plan and elevation above referred to. It will also be observed that there is a paradise or pavis in front of the entrances. The vaults in this case being small, the different spans were managed (although with round arches) by stilting the springing; but in great buildings like Spires and Worms, the vaults are necessarily square in plan, in this round-arched style, and the nave embraces in each of its bays two arches of the side aisles—a method also followed by the early Gothic architects. From the use of the round arch and solid walls, the exteriors are free from the great mass of buttresses used in Gothic buildings, and the real forms are distinctly seen.

RHENISH PRUSSIA (Ger. *Rheinprovinz*, or *Rheinpreussen*), the most western of the provinces of Prussia, formerly an outlying district of that monarchy, lying along the banks of the Rhine, connected in 1866 by the annexation of the intermediate states, Hesse-Cassel and Nassau, and bounded on the W. by Belgium and the Netherlands. Area, 10,230 sq. m.; pop. (1867) 3,455,483. In the south, the surface is mountainous, the principal ranges being the Hundsrück, the Eifelgebirge, and branches of the Westerwald. The largest river is the Rhine, which flows through the province in a north-north-west direction for 200 miles, and receives many affluents from left and right. The surface is everywhere more or less mountainous, except in the extreme north, and the soil of the higher mountain-tracts barely supports the inhabitants; while that of the valleys of the Rhine, Moselle, and Nahe are very fruitful, and the flat districts in the north are most productive in grain. Timber and minerals, including lead, copper, zinc, coal, &c., abound; and the warm and hot sulphur-springs of Aix (q.v.) and Burtscheid (q. v.) have a European reputation. Industry and manufactures are here prosecuted with the utmost energy, and with great success. The cotton manufactures of the Wupperthal, the silk manufactures of Krefeld and vicinity, and the woollen cloth and Cashmere manufactures of the district of Aix, are famous. R. P. came into the possession of Prussia by the treaty of Vienna in 1815. It consists of the former duchies of Cleves, Gelders, and Berg, of the principalities of Mörs and Lichtenberg, the northern and middle parts of the former archbishopric of Cologne, numerous lordships, portions from the four French departments of Rhein-Mosel, Mosel, des Forêts, and Saar, &c.

RHE'SUS MONKEY (*Macacus Rhesus*), an Indian monkey, extending further north than any other species except the Entellus (q.v.), or Hooman, and, like it, partially migratory, visiting regions of the Himalaya in summer, which are far too cold for

Rhesus Monkey (*Macacus Rhesus*).

it in winter. It is held in almost as great veneration by the natives of India as the Hooman itself; and the killing of one of these animals is apt to arouse the greatest popular indignation. The monkeys live in troops in the forests, chiefly in

hilly districts, and visit the cultivated grounds to carry away grain and other produce, which they store up for themselves among rocks. The native farmers leave a share for the monkeys, believing this to be necessary for the averting of their anger, as otherwise, next year, they would destroy the whole crop whilst green. The R. M. has a stout form, stout limbs, short ears, a short tail, large callosities, the skin hanging loose about the throat and belly, the hair rather long, the back brownish, the lower part of the back and the haunches bright chestnut, or almost orange, the shoulders and arms lighter. It is one of the most intelligent and mischievous of monkeys.

RHE'TORIC (Gr. *rhētorike*, from *rhētor*, an orator) in its broadest sense may be regarded as the theory of eloquence, whether spoken or written. It aims at expounding the rules which should govern all prose composition or speech designed to influence the judgments or the feelings of men, and therefore treats of everything that relates to beauty or force of style—e. g., accuracy of expression, the structure of periods, and figures of speech. But in a narrower sense rhetoric concerns itself with a consideration of the fundamental principles according to which particular discourses of an oratorical kind are composed. The three chief elements of an oration are usually held to be—*inventio*, or the discovery of proper ideas; *dispositio*, or their arrangement; and *elocutio*, or the style in which they are expressed. The ancients, however, who cultivated oral eloquence more than the moderns do, reckoned other two—viz., *memoria*, or memory, and *actio*, or gesticulation. The most distinguished writers on rhetoric in ancient times were Aristotle, Cicero, and Quinctilian; in modern times, Blair, Campbell, Whately, and Spalding among the English; Erneste Maass, Schott, Richter, and Falkmann among the Germans; and among the French, Rollin, Gibert, Le Batteux, La Harpe, Marmontel, and Andrieux.

RHEU'MATISM (from the Gr. *rheuma*, a flux) is a blood-disease in which inflammation of the fibrous tissues is the most marked characteristic. It occurs either as an acute or as a chronic affection; there is, however, no distinct line of demarcation between the two, and the latter is often a consequence of the former.

Acute rheumatism is indicated by general febrile symptoms, redness, heat, swelling, and usually very intense pain, in and around one or more (generally several, either simultaneously or in succession) of the larger joints, and the disease shews a tendency to shift from joint to joint or to certain internal fibrous membranes, and especially the pericardium; rheumatism being the most common origin of pericarditis, as has been already shewn in the article on that disease. The pulse is strong and full, there is headache, but seldom delirium, unless the heart is affected; the tongue is covered with a creamy thick fur, the tip and edges being red; the urine is turbid, and abnormally acid; and the skin is bathed in a copious perspiration, with so characteristic a smell (resembling that of sour-milk), that the physician can often recognise the disease almost before he sees the patient. The joints are extremely painful, and the pain is much increased by pressure, and consequently by movement which gives rise to internal pressure. Hence the patient lies fixed in one position, from which he dares not stir. There are two varieties of acute rheumatism. In one, the inflammation commences not in the joint, but *near* it, and attacks the tendons, fasciæ, ligaments, and possibly the muscles themselves. This form is termed *fibrous* or *diffused* rheumatism. In the other variety, the synovial membrane in the joint becomes affected, and an excess of fluid is poured into the joint, distending the membrane, and making it bulge out between the spaces intervening between the various tendons, ligaments, &c., round the joint. It is the knee-joint which is most commonly affected in this way, and fluctuation may readily be perceived on applying the hands to the two sides of the knee. In this form, which is called *synovial* rheumatism, the swelling and redness come on sooner, and are more marked than in the former variety. The fibrous is by far the most severe form, and it is to it that the previous sketch of the most marked symptoms chiefly applies. In the synovial form, the fever is less intense, the tongue less foul, the perspiration far less profuse, and the membranes of the heart are much less liable to be attacked. It is to this form that the term *rheumatic gout* is often applied, and it is by no means inappropriate, because synovial rheumatism forms (as Dr Watson has observed) a connecting link between gout and rheumatism, and partakes of the characters of both.

The only known exciting cause of acute rheumatism is exposure to cold, and especially to cold combined with moisture, and hence the greater prevalence of this disease amongst the poor and ill-clad. Sleeping in damp sheets or upon the damp ground, the wearing of wet clothes, and sitting in a cold damp room, especially if the sitter was previously warm from exercise, are examples of the kind of exposure which is apt to be followed by this disease. The excreting power of the skin being checked by the action of cold, certain effete matters which should be eliminated in the form of perspiration, are retained, and accumulate in the blood, which thus becomes poisoned. This blood-poisoning is not, however, a universal sequence to exposure to the cold. It only occurs when there is a special predisposition to this disease, or, as it is termed, a rheumatic diathesis or constitution, and the diathesis may be so strongly developed as to occasion an attack of acute rheumatism, independently of exposure to any apparent exciting cause. Men are more subject to the disease than women, but this probably arises from their greater exposure to atmospheric changes from the nature of their occupations. The predisposition is certainly affected by age; children under ten years, and adults over sixty, being seldom attacked, while the disease is most prevalent between the age of fifteen and forty. Persons once affected become more liable to the complaint than they previously were. Dr Fuller believes, from his observations made in St George's Hospital, that the disease is sometimes hereditary; whether this be the case or not, there can be no possible doubt that the predisposition is very apt to exist in members of the same family. The exact nature of the poison is unknown. The late Dr Prout regarded lactic acid as the actual *materies morbi*, and certain experiments recently made by Dr Richardson tend to confirm this view.

The danger in cases of acute rheumatism arises almost entirely from the disease going from the joints to the heart, and setting up Pericarditis (q. v.). Hence that mode of treatment will be best which tends most surely to prevent, or, at all events, to lessen, the risk of this complication. If the patient is a young person of robust constitution, and there are well-marked inflammatory symptoms (such as a flushed face and a bounding pulse), he should be at once bled from the arm. A large quantity of blood can usually be taken before any signs of faintness occur, and the bleeding is serviceable in at least three points of view. In the first place, it almost always mitigates the pain, and diminishes the febrile symptoms;

secondly, it enables other remedies, as calomel, opium, colchicum, &c., to act more efficiently; and thirdly, it may occasionally cut short the attack of the disease, which, if not arrested by treatment, may run on for six weeks, two months, or even longer. Unfortunately, however, the cases of rheumatism which are fit to bear free venesection are comparatively few, especially in large towns; and further, it often happens that the physician is not called in till the proper time for free depletion is past. Purging is probably almost as efficacious as blood-letting, at the beginning of the disease. From five grains to a scruple of calomel given every night, and followed in the morning, for three or four days in succession, by an ordinary black draught, will sometimes dislodge an enormous amount of dark and foul secretions from the liver and bowels, and give marked relief. The main drawback to this mode of treatment is the pain occasioned by changing the position when the bowels act; but this may be to a great extent obviated by the use of the bed-pan. Opium (or morphia) is one of the most valuable remedies in this disease, from its power of allaying pain and procuring sleep. Dr Corrigan of Dublin trusts to opium alone for the cure. He begins with one grain, and repeats that quantity (or a larger dose if necessary) at intervals of two hours, until the pain disappears. He found twelve grains in the twenty-four hours to be the average amount required; but half that quantity (or even less) will generally suffice, if the opium be combined with other remedies, as, for example, if it be given with ipecacuanha (as in Dover's Powder), or with small doses of calomel. Colchicum sometimes has a marvellous effect in subduing the disease, but it must be given with extreme care, in consequence of the prostration to which an over-dose gives rise. See Poisons. Dr Watson believes that this remedy is of most value when synovial symptoms are present, or when, in other words, the rheumatism approaches in its characters to gout. 'Large doses,' he observes, 'are not requisite. Twenty minims of the wine or of the tincture may be given every six hours until some result is obtained.' The abnormal acidity of the various fluids (the sweat, urine, and even the saliva) in acute rheumatism has led to the belief, that alkaline remedies would both neutralise the poison, and, from their diuretic properties, tend to eliminate it. The bicarbonate of potash in solution has been largely tried by Dr Garrod, who administered it in average doses of two scruples every two hours, by night and day, for several days together. Of 51 cases so treated, the average period of treatment was between six and seven days, and the average duration of the disease was slightly under a fortnight. The medicine soon rendered the urine alkaline, but did not irritate either the bladder or the intestines. It seemed rapidly to calm the pulse and to allay the febrile heat; and in no case did any heart-complication arise after the patient had been forty-eight hours under its influence. Other physicians, including the late Dr Golding Bird, prefer the acetate of potash. The mode of treatment by lemon-juice in doses of one or two ounces five or six times a day, originally advocated by Dr G. O. Rees, at first sight seems in direct antagonism to the alkaline mode of treatment. As, however, the most active principle in the lemon-juice is citrate of potash, which, before it reaches the kidneys, becomes converted into carbonate of potash, there is less essential difference between the acid and the alkaline mode of treatment than at first sight seems to be the case. Other methods have been suggested, and in 1865 a new mode of treating acute rheumatism was warmly advocated by Dr Davies of the London Hospital. It mainly consisted in the application of a series of blisters to the parts surrounding and adjacent to the affected joints. One of our highest authorities on this disease, Dr Fuller of St George's Hospital, after trying various hot external applications, finds that a mixed alkaline and opiate solution is far more powerful than any other in allaying acute rheumatic pain. The solution which he now usually employs is made by dissolving half an ounce (or rather more) of carbonate of potash or soda in nine ounces of hot water, and adding six fluid drachms of Battley's *Liquor opii sedativus*. Thin flannel, soaked in this hot lotion, is applied to the affected joints, and the whole is wrapped in a covering of thin gutta-percha.

Cases which are intermediate between acute and chronic rheumatism are of very common occurrence. In those cases of what may be termed *subacute* rheumatism, there is slight fever, and several joints are usually affected, without intense inflammation in any one joint. These cases soon shew signs of amendment under a mild alkaline treatment, as, for example, a drachm of liquor potassæ daily, well diluted and divided into three or four doses, and the moderate use of purgatives.

In all cases of acute and subacute rheumatism, the heart-sounds should be examined daily, or even oftener, with the view of detecting the earliest trace of cardiac affection, and, if possible, of checking its further development. For the treatment to be adopted when there is evidence that the membranes of the heart are affected, the reader is referred to Pericarditis (q. v.).

There are two kinds of *chronic rheumatism*, which are sufficiently distinct to require notice. In one there is considerable local heat and swelling, although unaccompanied with any corresponding constitutional disturbance; while in the other the patient complains of coldness (rather than heat) and stiffness of the affected joints. The former approximates most closely to the previously described forms of rheumatism, of which it is frequently the sequel, and must be treated in a similar manner; while the latter, which is termed by some the *passive* form, usually occurs as an independent affection. In passive rheumatism, the pain is relieved by friction, and the patients are most comfortable when warm in bed—conditions which increase the pain in the former variety. Patients of this kind derive benefit from living in a warm climate, from warm clothing, warm bathing, especially in salt water at a temperature of not less than 100°, the hot-air bath, &c. Friction with some stimulating liniment, and the peculiar manipulation known as shampooing, are here of service; and amongst the internal remedies, turpentine, cod-liver oil, sulphur, guaiacum, sarsaparilla, and Dover's Powder possess a high reputation. Dr Fuller recommends the muriate of ammonia as a remedy of 'singular efficacy;' but of all remedies for this affection there can be little doubt that the most efficacious is the iodide of potassium, given in five-grain doses, combined with a few grains of carbonate of ammonia three times daily. A patient who is liable to attacks of chronic rheumatism should always wear flannel next the skin during the day, and at night he should sleep between the blankets, abjuring altogether the use of sheets.

Rheumatic Diseases are less common in the lower animals than in men. Horses are not very liable to acute rheumatism, but suffer from a chronic variety, which occurs especially in conjunction with influenza. When affecting the limbs, it often exhibits its characteristic tendency to shift from one part to another. In cattle and sheep, rheumatic disorders

are more common and acute than in horses. The specific inflammation sometimes involves most of the fibrous and fibro-serous textures throughout the body, inducing general stiffness, constipated bowels, and high fever. This is rheumatic fever - the chine-felon or body-garget of the old farriers. Sometimes the disease mainly affects the larger joints, causing intense pain, lameness, and hard swellings; occasionally it is confined to the feet and fetlocks, when it is recognised as bustian-foul. Cattle and sheep on bleak exposed pastures, and cows turned out of the dairy to feed on strong alluvial grazings, are especially subject to rheumatism in its several forms. Amongst dogs, rheumatism is known under the name of kennel lameness, and is very troublesome and intractable in low, damp, cold situations. Blood-letting is rarely admissible except in the most acute cases amongst cattle. In all animals, a laxative should at once be given, with some saline matters and colchicum, and when the pain and fever are great, a little tincture of aconite may be added. For cattle, a good combination consists of one ounce of nitre, two drachms of powdered colchicum, and two fluid drachms of the Pharmacopœia tincture of aconite, repeated in water or gruel every three hours: half this dose will suffice for horses. With a simple laxative diet, dogs should have a pill night and morning containing five grains of nitre and two of colchicum. Comfortable lodgings, a warm bed, horse-rugs on the body, and bandages on the legs, will greatly expedite a cure. In chronic cases, or after the more acute symptoms are subdued, an ounce of oil of turpentine, and two drachms each of nitre and powdered colchicum, should be given for a cow, half that quantity for a horse, and one-fourth for a sheep. Hartshorn and oil, or other stimulating embrocations, diligently and frequently rubbed in, will often abate the pain and swelling of the affected joints.

RHIME, or RHYME, is more properly, perhaps, written *rime*, as it does not seem to be derived from the Greek *rhythm*, but to be a native Teutonic word, from the same root, probably, as Ger. *reihe*, a row, verb *reihen*, to array; also *reihen*, a song or a chain-dance, of which *reim* may be only a variety. In Ang.-Sax., *rim-craeft*, meant the art of numbering; *riman*, to number; and thus *rime*, although a native Teutonic word, may ultimately be from the same Aryan root as the Greek *Rhythm* (q. v.), which etymologists derive from *rheo*, to flow. In early English, rhime (and the same is true of Ger. *reim* and the other forms of the word in other northern tongues as well as in the Romanic) meant simply a poem, a numbered or versified piece (compare Lat. *numeri*, numbers = verses, versification); but it has now come to signify what is the most prominent mark of versification in all these tongues, namely, the recurrence of similar sounds at certain intervals. As there may be various degrees and kinds of resemblance between two syllables, there are different kinds of rhime. When words begin with the same consonant, we have *Alliteration* (q. v.), which was the prevalent form of rhime in the earlier Teutonic poetry (e. g., Anglo-Saxon). In Spanish and Portuguese, there is a peculiar kind of rhime called *Assonance*, consisting in the coincidence of the vowels of the corresponding syllables, without regard to the consonants; this accords well with the character of these languages, which abound in full-toned vowels, but is ineffective in English and other languages in which consonants predominate. In its more usual sense, however, rhime denotes correspondence in the final syllables of words, and is chiefly used to mark the ends of the lines or verses in poetry. Complete identity in all the parts of the syllables constitutes what the French call *rich* rhime, as in *modèle*, *fidèle*; *beauté*, *santé*. But although such rhimes are not only allowed but sought after in French, they are considered faulty in English, or rather as not true rhimes at all. No one thinks of making *deplore* rhime with *explore*. Rhyming syllables in English must agree in so far, and differ in so far; *the vowel and what follows it - if anything follow it—must be the same in both; the articulation before the vowel must be different*. Thus, *mark* rhimes with *lark*, *bark*, *ark*, but not with *remark*. In the case of *mark* and *ark*, the absence of any initial articulation in the last of the two makes the necessary difference. As an example of rhime where nothing follows the vowel, we may take be-*low*, which rhimes with fore-*go*, or with *O!* but not with *lo*. To make a perfect rhime, it is necessary, besides, that the syllables be both accented; *free* and merri*ly* can hardly be said to rhime. It is almost needless to remark, that rhime depends on the sound, and not on the spelling. *Plough* and *enough* do not make a rhime, nor *ease* and *decease*.

Such words as *roaring*, de-*ploring*, form *double* rhimes; and an-*nuity*, gra-*tuity*, *triple* rhimes. In double or triple rhimes, the first syllable must be accented, and the others ought to be unaccented, and to be completely identical. In the sacred Latin hymns of the middle ages, the rhimes are all double or triple. This was a necessity of the Latin language, in which the inflectional terminations are without accent, which throws the accent in most cases on the syllable next the last—do-*lorum*, vi-*rorum*; sup-*plicia*, con-*victa*. Although rhimes occur chiefly between the end-syllables of different lines, they are not unfrequently used within the same line, especially in popular poetry:

> And then to see how ye're negleckit,
> How *huff'd*, and *cuff'd*, and disrespeckit.
> *Burns.*

> And ice mast-*high* came floating *by*.
> *Coleridge.*

(See LEONINE VERSES.)

When two successive lines rhime, they form a *couplet*; three form a *triplet*. Often the lines rhime alternately or at greater intervals, forming groups of four (*quatrains*) or more. A group of lines embracing all the varieties of metre and combinations of rhime that occur in the piece, forms a section called a *stave*, sometimes a *stanza*, often, but improperly, a *verse*. In the days of Acrostics (q. v.) and other conceits, it was the fashion to interlace rhimes in highly artificial systems; the most complex arrangements still current in English are the Sonnet (q. v.) and the Spenserian (q. v.) stanza. Tennyson has accustomed the English ear to a quatrain, in which, instead of alternate rhimes, the first line rhimes with the fourth, and the second with the third.

It is a mistake to suppose that rhime is a mere ornament to versification. Besides being in itself a pleasing musical accord, it serves to mark the endings of the lines and other sections of the metre, and thus renders the Rhythm (q. v.) more distinct and appreciable than the accents alone can do. So much is this the case, that in French, in which the accents are but feeble, metre without rhime is so undistinguishable from prose, that blank verse has never obtained a footing, notwithstanding the war once waged by French scholars against rhimed versification. 'The advantages of rhime,' says Guest (*English Rhythms*), 'have been felt so strongly, that no people have ever adopted an accentual rhythm without also adopting rhime. The Greek and Latin metres of the classic period, depending upon time or quantity, and not upon accent, were able to dispense with the accessory of

rhime; but, as has been well observed by Trench (*Sacred Latin Poetry, Introduction*, 1864), even 'the prosodic poetry of Greece and Rome was equally obliged to mark this (the division into sections or verses), though it did it in another way. Thus, had dactyls and spondees been allowed to be promiscuously used throughout the Hexameter (q. v.) line, no satisfying token would have reached the ear to indicate the close of the verse; and if the hearer had once missed the termination of the line, it would have been almost impossible for him to recover it. But the fixed dactyl and spondee at the end of the line answer the same purpose of strongly marking the close, as does the rhime in the accentuated verse; and in other metres, in like manner, licences permitted in the beginning of the line are excluded at its close, the motives for this greater strictness being the same.' It is chiefly, perhaps, from failing to satisfy this necessary condition, that modern unrhimed verse is found unsatisfactory, at least for popular poetry; and it may be doubted whether it is not owing to the classical prejudices of scholars that our common English blank verse got or maintained the hold it has.

The objection that rhime was 'the invention of a barbarous age, to set off wretched matter and lame metre,' rests on ignorance of its real history. It cannot be considered as the exclusive invention of any particular people or age. It is something human, and universal as poetry or music—the result of the instinctive craving for well-marked recurrence and accord. The oldest poems of the Chinese, Indians, Arabians, &c., are rhimed; so are those of the Irish and Welsh. In the few fragments of the earliest Latin poetry that are extant, in which the metre was of an accentual, not quantitative kind, there is a manifest tendency to terminations of similar sound. This native tendency was overlaid for a time by the importation from Greece of the quantitative metres; yet even under the dominance of this exotic system, rhiming verses were not altogether unknown; Ovid especially shews a liking for them:

Quot cœlum stellas, tot habet tua Roma puellas;

and in the decline of classicality they become more common. At last, when learning began to decay under the irruptions of the northern nations, and a knowledge of the quantity of words—a thing in a great measure arbitrary, and requiring to be learned—to be lost, the native and more natural property of accent gradually reappeared as the ruling principle of Latin rhythm, and along with it the tendency to rhime. It was in this new vehicle that the early Christian poets sought to convey their new ideas and aspirations. The rhimes were at first often rude, and not sustained throughout, as if lighted upon by chance. Distinct traces of the adoption of rhime are to be seen as early as the hymns of Hilary (died 368), and the system attained its greatest perfection in the 12th and 13th centuries. In refutation of the common opinion, that the Latin hymnologists of the middle ages borrowed the art of rhime from the Teutonic nations, Dr Guest brings the conclusive fact, that no poem exists written in a Teutonic dialect with final rhime before Otfried's *Evangely*, which was written in Frankish about 870. Alliteration had previously been the guiding principle of Teutonic rhythms; but after a struggle, which was longer protracted in England than on the continent, it was superseded by end-rhimes.—See Guest's *History of English Rhythms* (2 vols., Lond. 1838), where the whole subject is learnedly and elaborately treated; Trench's *Sacred Latin Poetry, Introduction* (Lond. 1864); F. Wolf, *Ueber die Lais, Sequenzen, und Leiche* (Heid. 1841).

RHIN, BAS (LOWER RHINE), recently a frontier department in the north-east of France, formed, together with the province of Haut-Rhin, from the former French province of Alsace (q. v.), the German Els-ass, and, prior to the treaty of Ryswick, one of the most densely-peopled and industrious of the German states. The department of Bas-Rhin is bounded on the E. by Baden, and on the W. by the departments of Moselle, Meurthe, and Vosges. Area, 1758 sq. m.; pop. (1866) 588,970. It lies almost wholly within the basin of the Rhine, which flows north along its eastern border, and its surface is traversed by a large number of affluents and sub-affluents, which flow westward into that river. The Ill, from Haut-Rhin, joins the Rhine a few miles below Strasbourg; and the chief of the other affluents are the Lauter and Moder. The eastern portion of the department, lying along the left bank of the Rhine, consists wholly of plains; while in the west are the rugged and wooded heights which form the eastern slopes of the Vosges Mountains. A projection of the department to the north-west includes a portion of these mountains. In the hilly regions are many beautiful valleys. The winters are long and cold; the summer variable; the autumns always fine. Cretinism and goître prevail in some parts, though to a less extent now than formerly. The country is unusually rich in agricultural and manufacturing resources and capabilities. A great variety of grains, fruits, and vegetables, including fine crops of hemp and tobacco, are grown extensively; and white wines are held in the highest estimation. About 11,000,000 gallons of wine are made annually. Manufactures are carried on on a grand scale, and cotton, calico, woollen, and other factories are exceedingly numerous; foundries, arms and machine factories also abound. During the Franco-Prussian war, 1870—71, the department of Lower Rhine was early occupied by the Prussians, and suffered greatly in consequence of their requisitions On August 19, 1870, Strasbourg was besieged, and capitulated on the 28th of September, with upwards of 17,000 men. By the treaty of Versailles, Alsace (Upper and Lower Rhine), except Belfort, was incorporated in the German Empire. The capital is Strasbourg.

RHIN, HAUT (UPPER RHINE), recently a frontier department in the east of France, bounded on the N. by the department of Bas-Rhin (q. v.), and on the E. by Germany and Switzerland. Area, 1586 sq. m.; pop. (1866) 530,285. As in the case of the department of Bas-Rhin, the eastern frontier is for the most part formed by the Rhine, and the western frontier by the Vosges Mountains; and, as might be expected, the character of the surface much resembles that of that department. After the Rhine, the principal river is the Ill, into which the streams from the Vosges Mountains flow. In the middle of the department the soil is fertile, and of the valleys of the west some are exceedingly rich and productive. The climate is more inclement than that of Bas-Rhin. Of the entire surface of 1,015,040 acres, considerably more than one-third is under crop; 336,000 acres, principally in the long narrow tract between the Ill and the Rhine, are in wood; 130,000 acres in good rich pastures; and about 30,000 acres in vineyards. In agriculture, and in trade and manufactures, this department shews similar activity and enterprise with that of Bas-Rhin (q. v.). About 8,800,000 gallons of wine are made annually. The department is divided into the three arrondissements of Colmar, Altkirch, and Belfort. The capital is Colmar. See RHIN, BAS.

RHINA'NTHUS, a genus of plants of the natural order *Scrophulariaceæ*, having an inflated 4-toothed calyx; the upper lip of the corolla

compressed laterally, furnished on both sides below the tip with a straight tooth or lobe, the lower one plane and 3-lobed. The capsule is compressed and 2-celled. *R. crista-galli* is a very common British plant, an annual, 1–2 feet high, to be seen in almost every meadow and in many pastures, with yellow flowers, and rather large capsules, in which the seeds rattle when ripe, whence its common name, *Yellow Rattle*. It is also called Cock's-comb, from its fringed bracts.

RHINE (*Rhenus*), the most important river in Germany, and one of the most noted in Europe, takes its rise in the Swiss canton of the Grisons, and after a north-north-west course of about 800 miles, falls into the German Ocean. The area of the R. basin, including its various feeders, which have been counted to the number of 12,000, is estimated at about 86,000 sq. miles. The R. is divided into the Upper, Middle, and Lower R., the first of these terms being applied to the river from its source to Basel; the second applies to its course from Basel to Cologne; and the last to its course from Cologne through the Netherlands to the sea, into which it empties itself by several mouths, forming an extensive delta. The head-waters of the Upper R. consist of three main streams, called respectively the Vorder R., the Mittler R., and the Hinter Rhine. The first and most easterly rises on Mount Crispalt, north-east of Mount St Gothard, 7500 feet above the level of the sea, and flowing east, bursts like a torrent through a deep ravine. At Dissentis, 12 miles from its source, it is joined by the Mittler R., or central branch, at the comparative low level of 3500 feet. At Reichenau, 50 miles from the source of the Vorder R., the stream is swelled by the third branch, known as the Hinter R., which, taking its rise among the glaciers of the Vogelberg, flows over a distance of 80 miles before it blends its waters with the main branches. The Hinter R., considerably the longest of the upper waters, claims to be esteemed the chief source, and at its confluence with the other branch at Reichenau, the river first assumes the general name of Rhine. At Coire, where the river takes a sudden turn northward, it is nearly 150 feet wide, and navigable for rafts and flat boats. A little above the small town of Sargans, in St Gall, it leaves the Grisons, and forming the boundary between the small principality of Lichtenstein and the Vorarlberg on the right, and St Gall on the left, flows in a northerly direction to Rheineck, where it enters the Boden See, or Lake of Constance, which may indeed be regarded as the river itself, augmented in its course between Rheineck and Constance by the confluence of numerous streams. Emerging from the Upper Lake at Constance, the R. enters the Unter See, or Lower Lake, a few miles below, and following a westerly course, forms the boundary-line between Switzerland and the grand duchy of Baden; and after receiving the Thur, Töss, and Aar on the left, and the mountain torrents of the Wutach and Alb on the right, pursues its course to Basel. At Schaffhausen, about 13 miles from the western extremity of the Unter See, the waters of the river, rushing over a rock 70 feet high, form the cataract known as the Falls of Schaffhausen; while lower down the narrowing of the channel through the projection of rocks on either side gives rise to rapids both at Laufenburg, and at a point ten miles below it, known as Höllenhacken, where the navigation is impeded for a considerable distance by the force of the cataracts. Below Basel, the R., turning again due north, separates France from Baden, forms the eastern boundary of Rhenish Bavaria, cuts the province of Rhine-Hesse in two, and flows between Nassau and the Prussian Rhine provinces, through which it afterwards pursues a north-west course. Before it reaches Cologne, it takes up numerous tributaries and affluents—viz., the Ill, Wiese, Elz, Kinzig, Murg, Neckar, Main, Lahn, Moselle, &c.; and passes the cities of Breisach, Strasburg, Germersheim, Spires, Mannheim, Worms, Oppenheim, Mainz, Bingen, Coblenz, and Bonn. In this middle part of its course, the river makes great bends, the current is rapid, and navigation is rendered difficult by numerous small islands and sandbanks, which are subject to changes of form and position. Much has been done to improve the R. above Bingen. By an agreement made, in 1840, between France and Baden, it has been brought into its proper channel and considerably shortened. The valley through which the R. runs between steep banks from Mainz to Bonn, contains the picturesque scenery which has made this river so celebrated, and the vineyards from which the famous Rhenish wines are obtained. From Cologne to its mouths, the R. flows through a low level country, and soon after entering the Netherlands, divides it into two arms, the left, called the Waal, uniting with the Maas near Fort Loevestein, and forming the Merwede or Merwe, which below Dordrecht takes the name of the Old Maas; the right arm, called the R., a little above Arnheim, throws off the New Yssel, originally a canal, cut by Drusus to connect the R. with the Old Yssel. Flowing on to Wijk bij Duurstede, the R. divides again into the Lek, which unites with the New Maas near Ysselmonde, and the Kromme Rhine, which at Utrecht parts into the Vecht and the Old R., the latter as a small stream entering the North Sea by the Katwijk Canal to the north-west of Leyden. The delta of the R., which extends from about 51° 35′ to 52° 20′ N. lat., and occupies nearly 50,000 sq. m. of territory, belonging to the Dutch provinces of North and South Holland, Utrecht, and Guelderland, requires to be protected by strong embankments. The principal of these, which begin at Wesel, are about 25 or 30 feet above the lowest level of the river. Several canals connect the R. with the Rhone and Saone, the Scheldt, Meuse, and Danube, and thus open a line of communication with France and Belgium on the one side, and with the Netherlands and every part of Germany on the other. The commerce and navigation of the R., which are of vast extent and great importance, are regulated by treaties between the different states through which it passes, all of which levy tolls on vessels and goods entering their respective territories, and thus produce an accumulation of duties which press heavily on the transit trade. Steam-navigation is, however, conducted with greater regularity and energy on the R. than on any other river of Germany; and of late years, since the main lines of railway, running on either side of the river, have been connected by a bridge between Cologne and Deutz, additional importance and extension have been given to the commercial relations of all the countries connected with the Rhine. Pontoon or boat bridges cross the river at Cologne, Mainz, Mannheim, and a few other places.

RHINE, CONFEDERATION OF THE. See CONFEDERATION OF THE RHINE.

RHINE-WINE is a term of very general signification, applied, however, most frequently to those wines produced in the Rheingau (q. v.). The most valued and costly of these are the Schloss-Johannisberger, Hochheimer, Kloster-Eibacher, Rüdesheimer, Steinberger, Gräfenberger, Rauenthaler, Rothenberger, Scharlachberger, and Markobrunner. The red Rhine-wines, of which the Asmannshäuser

is the most celebrated, are not nearly so much prized as the white; neither have they the strength or bouquet of the latter. The wines of the Lower Rhine, from Düsseldorf downwards, are generally of inferior quality.

The term Rhine-wine, in its general signification, includes the Pfalz and Moselle wines. It is now generally held in Germany that Rhine-wines that have been properly kept for three or four years are in the most wholesome condition for use; the very old stocks no longer find a ready market except in Russia and England.

RHINO'CEROS (Gr. nose-horned), a genus of *Ungulata Perissodactyla*, containing the largest and most powerful of terrestrial mammalia, except the elephants. There are at least seven or eight existing species, all natives of the warm parts of Asia, the Indian Archipelago, and Africa; and numerous fossil species have been discovered in the newest geological deposits. The form of the R. is clumsy and uncouth; its aspect dull and heavy. The limbs are thick and strong; each foot is terminated by three toes, which are covered with broad hoof-like nails. The tail is small, and terminated by a small tuft. The ears are moderately large; the eyes very small. The head is large, the muzzle prolonged, and the nasal bones combined into an arch for the

Rhinoceros (*R. Indicus*).

support of a horn, which, however, does not spring from them, but merely from the skin; a second horn, in some of the species, growing above it, in like manner springing from the skin, and resting for support on the bone of the forehead. The upper lip is more or less prolonged and prehensile, in some of the species so much so that it is capable of being used to pick up very small objects. The whole body, head, and limbs are covered with an extremely thick and hard skin, which in none of the existing species exhibits more than mere traces of hair, although there is evidence that some of the extinct ones were covered with fur; and the hardness of the skin being such that in some of the species it has not pliancy enough to permit the movements of the animal, it is in a manner jointed by means of folds on the neck, behind the shoulders, in front of the thighs, and on the limbs.

The horn of the R. is a very remarkable organ, and a powerful weapon of offence and defence. With it also the animal can root up bushes or small trees, the foliage or fruit of which it desires to eat. It is of a perfectly homogeneous structure (see HORNS), and solid.

The different species of R. display some differences of dentition. None of the species of R. displays a high degree of intelligence. Although usually harmless, they are easily provoked, and shew much capriciousness of temper. When irritated, they become very dangerous; and although usually slow in their movements, they can, upon occasion, run rapidly. Their great weight and strength enable them to force their way through jungles, breaking down the smaller trees before them. The hide is proof against the claws of the lion or tiger, and is not to be penetrated by a leaden bullet, except at a very short distance, or in some of the thinner parts about the neck and chest. Bullets of iron or tin are used for shooting them.

The species of R. agree in being found sometimes solitary or in pairs, sometimes in little companies, never in large herds.

The INDIAN R. (*R. Indicus*) is a native of the continental parts of the East Indies, and lives chiefly in marshy jungles on the banks of lakes and rivers, often wallowing in the mud, with which it encases itself, apparently as a protection against insects, which annoy it notwithstanding the thickness of its hide. It is the largest known species of R., a large specimen being rather more than five feet in height. The horn is sometimes 3 feet in length, and 18 inches in circumference at the base. The Indian R. was known by very imperfect description to the ancient Greeks, receiving the very inappropriate name of *Indian Ass*. Individuals have from time to time been brought alive to Europe, and have proved tolerably quiet and tractable, feeding with apparent satisfaction on moistened hay, vegetables, pulse, grain, &c.—The JAVANESE R. (*R. Javanicus*, or *R. Sondaicus*) is a somewhat smaller species, also one-horned. Sumatra has a two-horned species (*R. Sumatrensis*).—Different species of R., all two-horned, are found in almost all parts of Africa, and one or more of them were known to the ancient Romans —The BOVELE, or BLACK R. (*R. bicornis*, or *R Africanus*), of South Africa, is the smallest of all the known species. It is of a black colour, and its first horn is rather thick than long, its second short and conical. It is a fierce and dangerous animal, capable of great activity, and more dreaded by the South African hunter than the lion itself.—The KEITLOA (*R. Keitloa*) is larger, and has the two horns nearly equal in length, the foremost horn curved backwards, the other curved forwards. It is also a native of South Africa, and much dreaded both on account of its strength and its ferocity. —The WHITE R. (*R. Simus*), or MUCHUCO, or MONOOHO, is the largest of the well-ascertained African species.

No species of R. is prolific. One young one only is produced at a birth, and the intervals are long. The flesh of the R. is used for food. That of the different species is somewhat variously esteemed. The skin is used in the East Indies for shields; in South Africa, it is sliced up into thongs.

The earliest remains of the R. are found in Miocene strata, and in the subsequent Tertiary deposits they frequently occur. Twelve species have been described,—four of them from the Miocene and Pliocene beds of the United States. A two-horned species was found by Pallas in the frozen gravel of Siberia, along with the mammoth, still covered with a shaggy coat of long wool, and having its flesh preserved.

RHINOPLA'STIC OPERATION. When a portion or the whole of the nose has been destroyed by accident or disease, the deficiency may be restored by a transplantation of skin from an adjoining healthy part. When the whole nose has to be replaced, the following course is usually adopted: A triangular piece of leather is cut into the shape of the nose, and is extended on the forehead with its base uppermost; its boundaries, when thus flattened, are marked out on the skin with ink. Any remains of the old nose are then pared away, and a deep groove is cut round the

Vol. VIII., page 236. RHINOCEROS

margins of the nasal apertures. When the bleeding from these incisions has stopped, the marked portion of the skin of the forehead must be carefully dissected away, till it hangs by a narrow strip between the eyebrows. When the bleeding from the forehead ceases, the flap must be twisted on itself, so that the surface which was originally external may remain external in the new position, and its edges must be fastened with stitches into the grooves prepared for their reception. The nose thus made, is to be supported with oiled lint, and well wrapped in flannel, to keep up the temperature. When complete adhesion has taken place, the twisted strip of skin may be cut through, or a little slip may be cut out of it, so that the surface may be uniformly smooth. When only a part of the nose, as one side only, or the septum, requires to be restored, modifications of the above operation are required, and the skin, instead of being taken from the forehead, is taken from the cheek or the upper lip. For further details regarding this important operation, the reader is referred to Fergusson's *Practical Surgery*.

This operation is popularly known as the *Taliacotian Operation*, from its having been first performed by Taliacotius, who was professor of anatomy and surgery at Bologna, where he died in 1553. The work in which the operation is described was not published for more than forty years after his death. It appeared in 1597, under the title *De Curtorum Chirurgia per Insitionem libri duo*. Instead of taking the skin for the new nose from the forehead, he took it from the arm of his patient, and there is no reason why the operation which he describes, although inferior in many respects to that at present adopted, should not be successful. The difficulty of keeping the arm sufficiently long in apposition with the face (a period of about twenty days), was doubtless one of the reasons for selecting the forehead in preference as the part from which to take the skin. The name of Taliacotius has been mainly popularised in this country by a well-known coarse joke in Butler's *Hudibras*. There is, however, little foundation for the view which Butler takes of the operation. Taliacotius discusses the advantages and disadvantages of taking the skin from the *arm* (he does not suggest any other part of the body) of another person, but he comes to the conclusion, that it would be impossible to keep two persons so fastened together for the necessary time, that no motion of the parts in apposition should occur, and he adds, that he never heard of the plan being attempted. It is almost unnecessary to add, that even if a nose were manufactured from the skin of a second person, there is not the slightest reason for apprehending that it would suddenly die and drop off on the death of the original proprietor of the skin, notwithstanding the cases to the contrary recorded, as illustrative of the power of sympathy, by Van Helmont, Campanella, Sir Kenelm Digby, and others. This astounding notion was resuscitated two or three years ago by M. Edmund About in a popular novel, entitled *Le Nez d'un Notaire*.

RHIPI'PTERA. See STREPSIPTERA.

RHIZA'NTHEÆ (RHIZOGENS of Lindley) are a very remarkable natural order of plants. They are parasitical plants, brown, yellow, or purple, never of a green colour, destitute of true leaves, and having cellular scales instead. The stem is amorphous and fungus-like; sometimes, as in Rafflesia (q. v.), there is no stem; but the flowers arise immediately from the surface of the branch or stem to which the plant is parasitically attached. Spiral vessels are either few or wanting, and the substance is chiefly cellular tissue. Whilst their general structure thus associates them with fungi, which they resemble also in their mode of decay, they have the flowers and sexual organs of phanerogamous plants. The flowers are monœcious, diœcious, or hermaphrodite. Lindley regards these plants as forming a class distinct from the other Phanerogamous plants (*Exogens* and *Endogens*), and as one of the connecting links between them and the Cryptogamous plants (*Thallogens* and *Acrogens*). There are not many more than 50 known species in all, of which one or two are found in the south of Europe, the others in Africa and the warmer parts of Asia and America. *Cynomorium coccineum* (*Balanophoraceæ*) is found in Malta, and is the *Fungus Melitensis* of apothecaries, long celebrated for arresting hæmorrhages. Others are likewise used as styptics. *Cytinus hypocistis* (*Cytinaceæ*) grows on the roots of species of Cistus in the south of Europe. Its extract (*Succus hypocistidis*) is used as an astringent in hæmorrhages and dysentery. A species of *Ombrophytum* (*Balanophoraceæ*) springs up suddenly after rain in Peru, like a fungus, is insipid, and is cooked and eaten under the name of *Mays del Monte*. Different species of *Balanophora* are very abundant in Northern India. They are found in the Himalaya at an elevation of 10,000 feet, producing great knots on the roots of maple trees, oaks, &c., which are sought after by the Tibetans, and carried into Tibet, where they are made into very beautiful cups.

RHIZO'PODA (Gr. *rhizon*, a root, and *poda*, feet), an important class of the lowest of the animal subkingdoms, the Protozoa. In all the organisms of this class, the body is composed of a simple gelatinous substance, to which the term 'sarcode' is applied; and in all, locomotion is performed by the protrusion of processes which, from their function, are termed 'pseudopodia,' or false feet. As in the case of all the Protozoa, except the Infusoria, there is no mouth or intestinal tube.

As a typical form of rhizopod, the *Amœba* (fig. 1) a minute animal readily obtained in this country

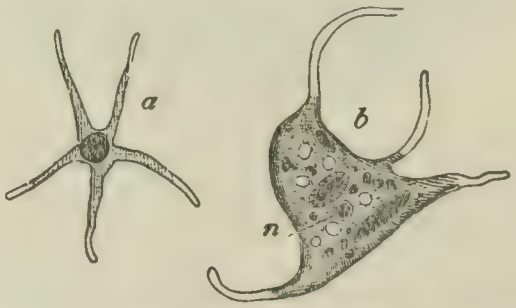

Fig. 1.—Amœba Radiosa.

a, young *Amœba*, with five pseudopodia protruded; *b*, another specimen.

may be taken. On placing one of these organisms (obtained from a pond, or from a bottle containing some vegetable infusion) under the microscope, it is seen to resemble a roundish mass of semi-transparent jelly, altogether devoid of life. Soon, however, the animal begins to push out in various directions portions of the gelatinous mass of which it consists, and by the alternate expansion and retraction of these prolongations, it effects a slow and somewhat irregular locomotion. Should these processes come in contact with anything fit for food, they grasp it and coalesce around it, and the morsel soon becomes enclosed in the interior of the body, much as (to use an illustration employed by Professor Greene in his *Manual of the Protozoa*) a stone may be forced into the interior of a lump of clay, or similar plastic material. When all that is nourishing is absorbed,

the indigestible remains are ejected through some part of the body. A nucleus may generally be observed, and at times (but not permanently) one or more clear vesicles may be noticed, containing a fluid which is apparently furnished during the process of digestion. The members of the genus *Amœba* (containing at least three species) may be regarded as representing the simplest forms of animal life. Closely allied to the *Amœba* is the *Actinophrys*, or Sun-animalcule (fig. 2), and both these genera

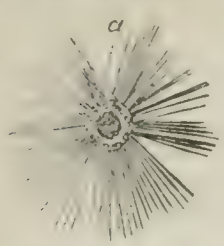

Fig. 2.—Sun-animalcule in the act of feeding:

Fig. 3.—Difflugia proteiformis.

Fig. 4. Ascella acuminata.

At *a* is seen a captured Infusorius entering the substance of the body.

are completely naked. In *Difflugia* (fig. 3), the 'sarcode' is invested with a membranous oval coat with an aperture at one end, from which the pseudopodia project. In *Ascella* (fig. 4) the soft parts are protected by a discoid, or hemispherical shield, open below; while in the *Foraminifera* (q. v.),

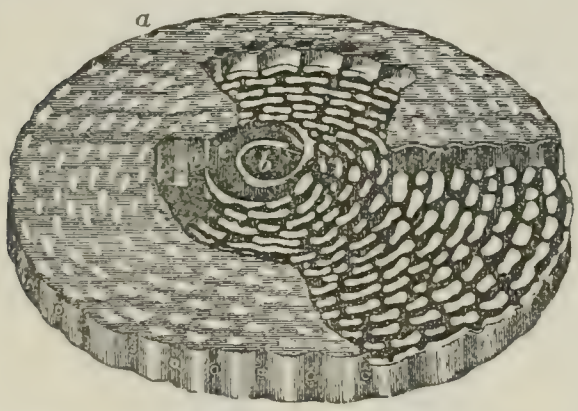

Fig. 5.—Structure of Orbitolites complanatus:

a, simple disc of *Orbitolites* laid open to shew its interior; *b*, central cell; *c*, circumambient shell, surrounded by concentric zones of shells connected with each other by annular and radiating passages.

the soft part is invested with a calcareous shell, which is sometimes simple, but more commonly consists of an agglomeration of minute chambers (fig. 5).

Various classifications of the Rhizopods have been proposed by different zoologists. That of Greene, in which they are simply divided into *Amœbea* and *Foraminifera*, is sufficient for all practical purposes. All the *Amœbea* are microscopic, and seldom exceed $\frac{1}{50}$th of an inch in diameter. The *Foraminifera* (q. v.) are somewhat larger.

Amongst the most important contributions to our knowledge of this department of the animal kingdom must be mentioned: Schultze, *Ueber den Organismus der Polythalamien*, 1854; Williamson, *On the Recent Foraminifera of Great Britain*, 1858; Claparède et Lachmann, *Etudes sur les Infusoires et les Rhizopodes*, 1858—1860; Carpenter, *Introduction to the Study of the Foraminifera*, 1861; and Hackel, *Die Radiotarien*, 1862.

RHODE ISLAND, one of the thirteen original United States of America, and the smallest in the Union, on the southern coast of New England, is 47½ miles from north to south, and 37 miles from east to west; and has an area of 1306 sq. miles. It is bounded N. and E. by Massachusetts, S. by the Atlantic, and W. by Connecticut. It is divided into five counties, and its principal towns are Providence and Newport, the twin capitals; Bristol, Warren, Pawtucket, Woonsocket, &c. Narraganset Bay, which occupies the south-eastern quarter of the state, is from 3 to 12 miles wide, and abounds in beautiful islands, the largest of which, Rhode Island, is 15 miles long, by 3 to 3½ wide, and contains the town of Newport, a fashionable summer resort, with a large and spacious harbour, and formidable fortifications. Several small rivers, as the Pawtucket, Pawtuxet, Parocatuck, &c., rising in the hills of Massachusetts, flow into Narraganset Bay, and their frequent falls afford water-power to numerous manufacturing villages. The country is hilly, and the soil rough and stony, and chiefly devoted to pasturage and orchards. The formation is chiefly of primary stratified and unstratified rocks, with some coal of a poor quality, iron, limestone, and marble. The climate is mild, and on the islands delightful. The population is chiefly engaged in trade and manufactures. There were, in 1860, 147 cotton, 68 woollen, 33 iron factories; a large coasting-trade and considerable fisheries are carried on. Five railways, and several steamboat lines, connect the chief towns with Massachusetts, Connecticut, and New York. There are 62 national banks and 25 savings-banks,—total deposits in the latter, about $21,500,000,—6 daily and 18 weekly newspapers, 310 churches, 650 school-houses, with 23,857 pupils, educated at an expense of $353,021 per annum, Brown University, and state penitentiary and asylums (see PROVIDENCE). The value of taxable property in 1869 was $138,196,489. The government, which existed until 1842 under the charter given to Roger Williams in 1642, is similar to that of the other states. The governor has a salary of $1000, and the lieutenant-governor $500, per annum. R. I. is believed to have been the Vineland of the Norsemen, who are supposed by some antiquarians to have explored this coast in the 10th c. It was settled in 1636 by Roger Williams and his companions, Baptists, who were expelled for their religious opinions from the Puritan colony of Plymouth. The colony suffered from the Indian wars, until the defeat and death of Philip, king of the Wampanoags. Pop. in 1820, 83,059; 1840, 108,830; 1860, 174,621; 1870, 217,353, of whom 4980 are coloured and 154 Indians.

RHODES, an island, now belonging to Asiatic Turkey, and long an important, wealthy, and independent state of ancient Greece, in the Mediterranean, lies off the south-west coast of Anatolia, from the nearest point of which it is distant about 10 miles. It is 46 miles long, and 18 miles in greatest breadth, and is traversed in the direction of its length—from north to south—by a chain of mountains, which rise in Mount Atairo (the former *Atabyris*, in ancient times crowned by a temple of Jupiter) to the height of 4560 feet. Pop. about 34,000, of whom 10,000 are Turks, and the remainder chiefly Greeks. The mountains are covered with forests, the valleys are fertile, and the well-watered plains form rich and beautiful pasture-lands. Of all the islands in the Levant, R. possesses the most beautiful and the most temperate climate. The vines and olives yield abundantly, and rich harvests of grain, tobacco, and delicate fruits are obtained. Valonea, sponges, wine, and fruits are the chief articles of export. The harbours of R. are in a wretched condition. In 1863, 515 vessels of 147,124 tons entered and cleared the ports. The imports for the same year amounted to £152,000, the exports to £77,000.

R., the ancient *Rhodos*, was inhabited at a very early period. The Telchines, who are asserted by tradition to have been its most ancient inhabitants, are said to have migrated hither from Crete. It was not, however, until the immigration of a branch of the Doric race that the distinctive national character of the Rhodians became fixed. The first immigration of Dorians seems to have taken place before the Trojan war, for R. is said to have sent nine ships to Troy under the leadership of the Heracleid Tlepolemus. Situated between the three ancient continents, a position highly favourable to the development of commercial enterprise, the Rhodians at an early period rose to great prosperity and affluence. Their three most ancient towns were Lindus, Ialysus, and Camirus, and they planted numerous colonies not only on the shores in their vicinity, but also on the coasts of Lycia, Italy, Sicily, and Spain. At the end of the 5th c. B.C., they founded the city of Rhodes (q. v.); and after this event, the history of the island is comprised in that of the city.

RHODES, an ancient and famous maritime city, capital of the island of the same name, and situated on the north-east extremity of that island. Lat. of harbour 36° 26′ N., long. 28° 16′ E. The modern city, though scarcely one-fourth the size of the former one, has an imposing appearance. Its site is admirable, and it rises in the form of an amphitheatre behind the fortified harbours, of which there are two, separated from each other by a narrow quay. At the entrance to the harbours stand the two large quadrangular towers of St John and St Michael. The harbours, however, are now neglected, and this once flourishing mart of the East is now comparatively desolate, and is no longer the seat of industry or active commerce. The town, overlooked by mosques and minarets, consists of ill-built houses and gloomy streets. The earthquakes of 1851, of 1856, and of 1863, as well as the frightful powder-explosion in 1856, caused by a flash of lightning, did much to devastate the town. By the powder-explosion, the church of St John, built in 1500, and the great tower of the Knights of St John, were shattered, together with 300 houses, under the ruins of which 1000 townspeople lost their lives; and by the earthquake of 1863, 2000 houses were destroyed, and many lives lost. The palace of the Grand Master is now in ruins, and the hospital of the knights now serves as a granary. Pop. about 20,000.

The city of R. was founded in 408 B. C., and was built on a regular plan, the unity and harmony of its architecture being secured by the circumstance, that the design of the whole was the work of one man. It was girt about by strong walls, surmounted by towers, and was provided with two excellent harbours. But it was remarkable for the number and excellence of its paintings, sculptures, and statues, as well as for the beauty and strength of its architecture. At the entrance of one of its ports stood a gigantic brazen statue of Helios, 70 cubits in height, and called the Colossus of Rhodes. Besides this statue, which is described as one of the seven wonders of the ancient world, 3000 others, of which 100 were colossal, adorned the city. The capital of a fertile and flourishing island, and the great centre of the commerce of the Mediterranean, R. long enjoyed great prosperity. The arts were also prosecuted with assiduity, and intellectual activity manifested itself here long after it had declined in most parts of Greece. From the outbreak of the Peloponnesian War to the middle of the 4th c. B.C., R. was alternately in league with Athens and in arms against that city. Like the rest of Greece, it submitted to the victorious Alexander, and received a Macedonian garrison; but on the death of Alexander, 323 B. C., the Rhodians rose upon and expelled the intruders. From this time to the overthrow of the Macedonian monarchy, R. largely extended its territories, and rose to great commercial and naval importance. After the death of Cæsar, whose side the Rhodians had taken against Pompey in the civil war, they were defeated in a naval engagement by Cassius, who in 42 B. C. entered the city by force, massacred the hostile leaders, seized the public property, and rifled the temples. This visitation broke the power of R., but it long continued to maintain its *prestige* as a seat of learning. During several centuries, R. remained in the power of the Greek emperors. In 1310, the Grand Master of the Knights of St John of Jerusalem settled here, and here the brethren remained till the 16th century. (See JOHN, ST, KNIGHTS OF.) Since this period, R. has remained a possession of Turkey.

RHO'DIAN LAW is the earliest system of marine law known to history, said to be compiled by the Rhodians after they had by their commerce and naval victories obtained the sovereignty of the sea, about 900 years before the Christian era. Cicero refers to the Rhodians as illustrious for their naval discipline. The collection of marine institutions termed Rhodian Laws is to be found in Vinnius, but their authenticity is doubted. Some say that the Romans adopted these laws during the first Punic war; others say that Justinian incorporated them with the Roman law. The leading points supposed to be borrowed from the Rhodian law relate to the shares of the officers and crew of a ship, the punishment of barratry and of plundering wrecks, and compensation payable to the heirs of mariners who lost their lives in the service of the vessel.

RHO'DIUM (symb. Rh; equiv. 104; spec. grav. 12·1) is one of the metals of the platinum group, discovered by Wollaston in 1804. It is a white, very hard metal, resembling aluminium rather than silver. It fuses less easily than platinum. It is ductile and malleable when pure and after fusion, and insoluble in all acids; but when alloyed in small quantity with platinum, copper, bismuth, or lead, it dissolves with them in *aqua regia*. It usually forms about one-half per cent. of the ore of platinum, from which it is extracted by a complicated process, for details of which we must refer to Deville and Debray's 'Memoir on Platinum and its Ores,' in the *Annales de Chimie et de Physique* for 1859. Two oxides, two sulphides, and three chlorides of rhodium have been obtained and examined by chemists. The sesquichloride unites with several soluble chlorides to form crystallisable double salts, which are of a rose colour (whence the name rhodium, from the Gr. *rhodon*, a rose). An alloy of steel, with a small quantity of rhodium, is said to possess extremely valuable properties; and according to Deville, an alloy of 30 or more parts of rhodium with 70 of platinum, is easily worked, and is not attacked by aqua regia, and hence it forms an excellent material for crucibles. R. is found with platinum, &c., at Port Orford, Oregon, and elsewhere.

RHODODE'NDRON (Gr. rose-tree), a genus of trees and shrubs of the natural order *Ericaceæ*, having ten stamens, a very small calyx, a bell-shaped or somewhat funnel-shaped corolla, and a capsule splitting up through the dissepiments. The buds in this and nearly allied genera, as *Azalea* (q. v.), are scaly and conical. The species are numerous; they have evergreen leaves, and many of them are of great beauty both in foliage and in flowers. A few small species are natives of Continental Europe and of Siberia; but the greater number belong to the temperate parts of North America, and to

the mountains of India. *R. maximum*, so designated when the far larger Indian species were unknown, is common in Britain as an ornamental shrub. It is a large shrub or small tree, which forms impenetrable thickets on many parts of the Alleghany Mountains, and has a magnificent appearance when in flower. The leaves are large, oblong, acute, stalked, leathery, dark green and shining above, rusty brown beneath. The flowers are large, in umbellate corymbs, varying in colour from pale carmine to lilac. This species is quite hardy in Britain; as is also *R. ponticum*, a very similar species, with narrower and more pointed leaves, which are of the same colour on both sides, a native of Western Asia, and apparently also of the south of Spain. *R. Catawbiense*, a native of the southern parts of the Alleghanies, with large purple flowers; *R. Caucasicum*, the name of which indicates its origin; and *R. arboreum*, a native of Nepaul, with very dense heads of large scarlet flowers, and leaves 4—6 inches long, attaining in its native country a height of 30 or 40 feet, are also fine species, and well known. Most of the extremely numerous varieties now common in our gardens and shrubberies have been produced from them by hybridising or otherwise.—Many splendid species of R. have recently been discovered in the Himalaya, the Khasia Hills, and other mountainous parts of India, by Dr Hooker and others; and some of them have begun to be introduced into cultivation in Europe. It is impossible for us to notice more than a few. *R. Falconeri* is described as in foliage the most superb of all, the leaves being 18 or 19 inches long. It is a tree 30—50 feet high, with leaves only at the extremities of the branches. It grows in Eastern Nepaul at an altitude of 10,000 feet. *R. argenteum* has flowers 4½ inches long, and equally broad, clustered, and very beautiful. *R. Maddeni*, *R. Aucklandii*, *R. Edgeworthii*, and others, have white flowers. *R. Dalhousiæ* is remarkable as an epiphyte, growing on magnolias, laurels, and oaks. It is a slender shrub, bearing from three to six white lemon-scented bells, 4½ inches long, at the end of each branch. *R. Nuttalii* has fragrant white flowers, said to be larger than those of any other rhododendron. All these belong to the Himalaya. In more southern latitudes, as on the Neilgherry Hills and on the mountains of Ceylon, *R. nobile* prevails, a timber tree 50—70 feet high, every branch covered with a blaze of crimson flowers.—*R. Keysii* and *R. Thibandiense*, also natives of the north of India, have flowers with nearly tubular corolla.—*R. ferrugineum* and *R. hirsutum* are small species, shrubs from one to three feet in height, natives of the Alps, and among the finest ornaments of alpine scenery. They are called *Alpenrose* (Alpine Rose) by the Germans. They are not easily cultivated in gardens. They have small carmine-coloured flowers in umbellate clusters. The mountain slopes glow with their blossoms in July and August. The flora of the Himalaya contains a number of similar small species. *R. anthopogon* and *R. setosum*, dwarf shrubs with strongly-scented leaves, clothe the mountains in Eastern Nepaul at an elevation of 12,000 feet and upwards, with a green mantle, brilliant with flowers in summer. *R. nivale* is the most alpine of woody plants, spreading its small woody branches close to the ground, at an elevation of 17,000 feet in Sikkim. *R. Lapponicum*, a procumbent shrub, with small flowers, grows as far north as human settlements have reached in Europe, Asia, and America.—Some of the species of this genus possess narcotic properties. An oil obtained from the buds of *R. ferrugineum* and *R. hirsutum* is used by the inhabitants of the Alps, under the name *Olio di Marmotta*, as a remedy for pains in the joints, gout, and stone. *R. chrysanthum*, a low shrub, with golden yellow flowers, native of Siberia, is also used in gout and rheumatism. *R. cinnabarinum*, a Himalayan species, poisons goats which feed upon it, and when used for fuel, causes inflammation of the face and eyes. But the flowers of *R. arboreum* are eaten in India, and Europeans make a pleasant jelly of them.

RHO'MBUS. See PARALLELOGRAM.

RHONE (*Rhodanus* of the Romans), which takes its rise in the Swiss Alps, on the western side of Mount St Gothard, not far from the sources of the Rhine, is the only important French river which falls into the Mediterranean. Its entire length, from its origin to the Gulf of Lyon at its embouchures, is 644 miles, and the area of its river-basin 28,000 sq. miles. The R. is, for its length, probably the most rapid river in the world. On issuing from its source, it runs in a south-westerly direction through the canton of Valais, and after being swelled in its rapid course by the afflux of several tributaries, it takes a sudden turn to the north near Martigny, and throws its waters into the Lake of Geneva (q. v.). After issuing from the lake, it takes up the turbid stream of the Arve, and forcing its passage through a rocky gorge of the Jura chain, disappears below the rocks near Fort l'Ecluse for a length of 300 feet, forming the subterranean channel known as *La Perte du Rhone*. At St Génis, the R. enters a less mountainous district, and passing beyond the Jura district, flows through a low valley to Lyon, where it receives the Saône. From Lyon it follows a southern direction past Vienne, Valence, Montélimart, Avignon, and Arles, bifurcating near Beaucaire and Tarascon into two main streams, the Greater and the Lesser Rhone, which enclose the delta known as the Ile de la Camargue, and finally merge their waters with those of the Mediterranean. The most important affluents of the R. are, on the right, the Ain, Saône, Doubs, Ardèche, and Gard; on the left, the Arve, Isère, Drôme, and Durance. From Lyon southward, the R. is easily navigable for good-sized vessels; but the up-navigation, owing to the rapid fall of the stream, and the sudden shifting of sandbanks, is attended with considerable difficulty, and is at times almost impracticable. On account of these and other obstructions, which are greatest near the mouths of the river, the communication with the Mediterranean is chiefly effected by means of canals, which, communicating with several shore-lakes, as l'Etang de Berre and others, open a passage between the sea at Port du Bouc and the river at Arles, and thus obviate the necessity of navigating round the delta. In its upper and middle course, the R. presents beautiful and varied scenery, enriched with a luxuriant southern vegetation, including grapes of superior quality, from which some of the finest wines of France are obtained; but below Avignon, it passes through a broad, arid tract of country, and is bounded by swampy banks. The great natural commercial advantages of the R. have been considerably extended by means of numerous canals, which, by joining it to the Seine, the Loire, and the Rhine, have connected it with the Atlantic and the German Ocean.

RHONE, a small but important inland department of France, bounded on the N., W., and S. by the departments of Saône-et-Loire and Loire; area, 1077 sq. m.; pop. (1866) 678,648. It lies almost wholly in the basin of the Rhone, and its great affluent the Saône; its eastern boundary is formed by these rivers. The surface is almost entirely mountainous or hilly. Of the 689,536 acres, more than one-half is under tillage. The principal productions are vines and mulberry-trees

The wines are famous for their excellent quality. Of the Mâcon wines, grown in the north, in the former district of Beaujolais, the best are the fine red wines of Chenas; of those grown in the south of the department, called the *vins du Rhone*, the finest are the red wines of Côte Rôtie and the white wines of Condrieu. About 75,000 acres are in vineyards, and the amount of wine made annually is about 17,000,000 gallons. Silks (see LYON) are manufactured extensively, and numerous other branches of manufacture are actively carried on. The industries of the department are mentioned under the names of the towns. The department is divided into the two arrondissements of Lyon and Villefranche. Capital, Lyon (q. v.).

RHONE, BOUCHES DU. See BOUCHES-DU-RHONE.

RHU'BARB (*Rheum*), a genus of plants of the natural order *Polygoneæ*, closely allied to *Rumex* (dock and sorrel), from which it differs in having nine stamens, three shield-like stigmas, and a three-winged achenium. The species, which are numerous, are large herbaceous plants, natives of the central regions of Asia, with strong, branching, almost fleshy roots; erect, thick, branching stems, sometimes 6 or 8 feet high; the stems and branches whilst in the bud covered with large membranous sheaths. The leaves are large, stalked, entire or lobed; the flowers are small, whitish or red, generally very numerous, in large loose panicles of many-flowered clusters. The roots are medicinal; but those of different species seem to possess their medicinal properties in very different degrees, or these properties are developed very variously in different soils and climates, or according to other circumstances not at all understood. It is not known what species of R. yields the valued R. of commerce, which comes from inland parts of China or Chinese Tartary. Some of it reaches Europe by way of Canton, but the best is brought through Russia. It is commonly known, however, in Britain as *Turkey R.*, because it was formerly brought by way of Natolia. It is carefully examined at Kiachta by persons appointed by the Russian government, so that the superior quality of all that is permitted to enter the European market is secured. R. is sometimes cultivated for its root in Europe, but the produce, *French R.* and *English R.*, is very inferior to the R. of the East, which it is often employed to adulterate. About 12 acres are devoted to the cultivation of R. for its root near Banbury, in England, the species cultivated being *Rheum rhaponticum;* but in France, besides this species, *R. undulatum* and *R. compactum* are employed. At Banbury, the roots are taken up when three or four years old, and dried in drying-houses by a carefully regulated heat.

The leaf-stalks of R. contain an agreeable mixture of citric and malic acids, and when young and tender, are much used, like apples, for tarts or pies, and also for making a kind of preserve. For these purposes, different kinds of R. are now very extensively cultivated in Britain, and in other temperate and cold countries, although it is only since the beginning of the present century that this valuable addition has been made to the plants of our kitchen-gardens; the species previously introduced having been cultivated merely as objects of curiosity, or for the sake of their roots. A number of species have been introduced into cultivation for their leaf-stalks. *R. palmatum*, the first species known, and which was once believed to yield the Turkey R., has roundish green leaf-stalks and half-palmate leaves, with pinnatifid pointed lobes. Its stalks are very inferior to every other kind in our gardens both in size and quality, and the appearance of the leaf is very different. The other cultivated kinds, *R. undulatum*, *R. rhaponticum*, and *R. hybridum*, with endless varieties produced by the art of the gardener, all have broad, heart-shaped, undivided leaves, and the leaf-stalks flattened and grooved on the upper side. The leaf-stalks are often also of a reddish colour, which in some of the finest varieties pervades their whole flesh. R. is propagated by seed, and the plants yield a crop in the second or third year, or by dividing the roots. It prefers a light rich soil; and the ground ought to be heavily manured every year. The plants are placed 3 or 4 feet apart, according to the size of the variety. The varieties which, by excessive manuring, are made to produce the most gigantic stalks, are not nearly so good in quality as the smaller kinds. R. is cultivated on a most extensive scale by market-gardeners. It is forced in winter and early spring by being placed in pots within houses, or by having pots inverted over it, and dung and straw heaped around; and forced R. is more tender and delicate than that which grows in open air.

There are few subjects in the materia medica which are so enveloped in obscurity as rhubarb. Even the period of its introduction into medicine is uncertain, for the description given by Dioscorides of the drug which he designates *Rheon* does not correspond with our rhubarb. It was probably introduced into Europe by the Arabian physicians, somewhat previous to the time of Avicenna, in whose writings the term *Rewund* occurs—a name still used, with a slight alteration, for R. by the Persians and Hindus. In the British Pharmacopœia, no attempt is made to determine the species of *Rheum* used in medicine, and there can be no doubt that the roots of several species are usually to be found in the drug-market. According to the Pharmacopœia, the root, deprived of its bark, is imported from 'Chinese Tibet and Tartary.' It yields a yellow colouring matter termed *Rhein*, *Rhubarbin*, *Rhubarbic Acid*, or *Chrysophanic Acid*, having the composition $C_{10}H_8O_3$, which is sparingly soluble in water, but dissolves freely in the alkalies, producing a reddish-brown liquid, from which the rhein may be precipitated in flakes on the addition of acetic acid. R. is very liable to adulteration; and if the adulterated R. be in a state of powder, the detection of the fraud is very difficult.

R. may be briefly described as a cathartic, an astringent, and a tonic. As a cathartic, it chiefly operates by increasing the muscular action of the intestines; and when the cathartic action is over, there is generally more or less constipation, arising, as is usually supposed, from the astringent action then coming into play. The appetite is also improved, and the digestive process rendered more active, by the action of this drug. It must not be forgotten that the colouring matter of R. passes into the serum of the blood and the secretions; and urine rendered red by its absorption has not unfrequently been confounded with bloody urine by practitioners ignorant of the very different chemical reactions of rhein and the colouring matter of blood.

R. is one of the best aperients for general use in infancy, in consequence of the certainty of its action, and of its tonic and astringent properties, which are of much importance in the treatment of many infantile diseases, attended with imperfect digestion and irritation of the intestinal canal. In adults, it is serviceable in chronic diarrhœa and dysentery, when it is expedient to clean out the bowels. It is also a useful aperient in convalescence from exhausting disease, as being free from the risk of overacting; and for the same reason, it is a

useful medicine for persons who are constitutionally liable to over-purgation from trivial causes.

The officinal preparations are the *Pulvis Rhei Compositus* (composed of powdered R., magnesia, and ginger, and popularly known as Gregory's Powder or Mixture—the average dose being a teaspoonful), the *Pilula Rhei Composita* (a compound R. pill, composed of R., aloes, myrrh, hard soap, oil of peppermint, and treacle—the dose, as an aperient, being ten or fifteen grains), the *Extractum Rhei* (dose from five to ten grains), the *Infusum Rhei* (dose from two to four fluid ounces), and the *Tinctura Rhei*, which is usually given in doses of about a drachm, in association with other aperients.

RHUMB, or RHOMB (Lat. *rhombus*), a term introduced, according to Vitalis, into navigation by the Portuguese, and signifying at first a meridian, or especially the principal meridian of a map. It then came to signify any vertical circle, whether a meridian or not, and hence any point of the compass. A ship is therefore said to sail on a rhumb when its head is kept constantly directed to the same point of the compass. The rhumb-line thus crosses all meridians at the same angle, and corresponds exactly to what is known as the *Loxodromic Lines* (q. v.). In Mercator's chart, the rhumb-line is a straight line (though not so in nature); but it must be carefully noticed that equal portions of it on the chart do not indicate equal distances on the surface of the globe, the divisions which are lowest in latitude always representing the greatest distance, and *vice versâ*.

RHYME. See RHIME.

RHYMER, THOMAS THE, a name given to the earliest poet of Scotland. The history of his life and writings is involved in much obscurity; but it is generally believed that Thomas Learmount of Ercildoune was the person whose poems and prophecies were extensively known among the people of Scotland at an early period. The R. derived his territorial appellation from the village of Ercildoune, in the county of Berwick, situated on the river Leader, about two miles above its junction with the Tweed. The time of his birth is unknown; but he appears to have reached the height of his reputation in 1283, when he is said to have predicted the death of Alexander III., king of Scotland. This singular prophecy is recorded in the *Scoti-chronicon* of Fordun in 1430, who relates that one day the R., when visiting at the castle of Dunbar, was interrogated by the Earl of March, in a jocular manner, if to-morrow should produce any remarkable event. The R. is reported to have expressed himself to the effect: 'Alas for to-morrow, a day of calamity and misery! Before the twelfth hour shall be heard a blast so vehement that it shall exceed all those which have yet been heard in Scotland—a blast which shall strike the nations with amazement, shall confound those who hear it, shall humble what is lofty, and what is unbending shall level with the ground.' On the following day, the earl, who had been unable to discover any unusual appearance in the weather, when seating himself at table observed the hand of the dial to point to the hour of noon; while, at the same moment, a messenger appeared bringing the mournful tidings of the accidental death of Alexander at Kingorn.

From this and other prophecies, the R. became popularly known as 'True Thomas,' and was believed to have derived his skill from his intercourse with the queen of Fairyland. The legend bears that he was carried off at an early age to Fairyland, where he acquired all the knowledge which made him so famous. After seven years' residence there, he was permitted to return to the earth, to enlighten and astonish his countrymen by his prophetic powers, still remaining bound to return to his royal mistress when she should intimate her pleasure. Accordingly, while the R. was making merry with his friends in his tower at Ercildoune, a person came running in, and told, with marks of fear and astonishment, that a hart and hind had left the neighbouring forest, and were composedly and slowly parading the street of the village. The R. instantly rose, left his habitation, and followed the animals to the forest, whence he was never seen to return. The Eildon Tree, where he delivered his prophecies, no longer exists, but its site is marked by a large stone called the Eildon Tree Stone. A neighbouring rivulet takes the name of the Bogle (or goblin) Burn from the R.'s supernatural visitants.

The earliest edition of the prophecies of the R. was published in Edinburgh, by Waldegrave, in 1603; and another edition by Andro Hart in 1615 (reprinted by the Bannatyne Club).

Allusions to the R. occur in Wynton's *Chronicle*, Blind Harry's *Wallace*, and other ancient Scottish authors. In Bellenden's translation of Boece, printed in 1535, it is stated that 'this Thomas wes ane man of gret admiration to the pepil; and schew sindry thingis as thay fell, howbeit thay wer ay hid under obscure wourdis.' In the poems of Robert of Brunne, who flourished about 1303, there is an incidental notice that the R. had composed a version of the incomparable romance of *Sir Tristrem*. It was long a subject of inquiry to Scottish antiquaries where this literary treasure might exist; until a copy of it was discovered by Mr Ritson in the Auchinleck manuscript, preserved in the Advocates' Library, which was edited by Sir Walter Scott in 1804. The merits of this romance are of a very high order, and the R. must be regarded as having possessed a poetical genius superior to any of his contemporaries.

The time of the death of the R., like that of his birth, is a matter of conjecture; but he must have died before 1299, the date of a charter in which his son calls himself 'Filius et hæres Thomæ Rymour de Ercildon.'

RHYNCHONE'LLA, a genus of brachiopodous mollusca, characterised by its trigonal acutely-beaked shell, the dorsal valve of which is elevated in front, and depressed at the sides, and the ventral valve is flattened or hollowed along the centre. The genus is represented by two living species, the one from the icy seas of the north, and the other from New Zealand. The shells of both are black. No less than 250 species of fossil shells have been referred to the genus. They occur in all formations from the Lower Silurian upwards.

RHYNCHO'PHORA. See WEEVIL.

RHYNCHOPS. See SKIMMER.

RHYTHM (Gr. *rhythmos*, any motion, especially a regulated, recurring motion; hence, measured motion, time, number), in its widest sense, may be defined as measured or timed movement, regulated succession. It seems to be a necessity for man, if movements of any kind are to be sustained for a length of time, that some more or less strict law of interchange should regulate the succession of the parts. It is even believed that the ground of this necessity may be discovered in the structure and functions of the human body. See Bain, *The Senses and the Intellect*. More particularly, in order that a number of parts may constitute a whole, or, at all events, a pleasing whole, a certain relation or proportion must be felt to pervade them. When exemplified in the arrangement of matter into visible objects, as in sculpture, architecture, and other

plastic arts, rhythm is usually called *symmetry*. Rhythm applied to the movements of the body produces the *dance*. 'The rhythmical arrangement of sounds not articulated produces *music*, while from the like arrangement of articulate sounds, we get the cadences of *prose*, and the measures of *verse*. Verse may be defined as a succession of articulate sounds, regulated by a rhythm so definite that we can readily foresee the results which follow from its application. Rhythm is also met with in prose; but in the latter its range is so wide that we never can anticipate its flow, while the pleasure we derive from verse is founded on this very anticipation.'

The rhythm of verse is marked in various ways. In Sanscrit, Greek, and Latin, during their classic periods, *quantity*, or the regulated succession of long and short syllables, was the distinguishing mark of verse. In the languages descended from these three ancient tongues, as well as in all the other Aryan languages, the rhythm depends upon *accent*. See METRE. The recurrence of similar sounds, or *rhime*, is also used, along with accent, to render certain points of the rhythm more distinct, as well as to embellish it. See RHIME.

RHYTHM, in Music, the disposition of the notes of a musical composition in respect of time and measure. To rhythm, music is chiefly indebted for its order, perspicuity, intelligibility, and consequently its power and effect. The rhythmical value of a musical sound is the ratio which its duration bears to that of other sounds. See NOTE. A musical composition is made up of portions of equal rhythmic value, called *measures*, separated by vertical lines called bars, the length of the measure being indicated by a sign at the beginning of the movement. For the varieties of time and their signatures, see MUSIC. The first note in each measure is distinguished by a greater force or stress than the rest: that stress is called *accent*, and of the four measure-notes in common time the third has also a subordinate accent, as has the third measure-note in triple time. There is also an irregular or rhetorical accent in music called *emphasis*, which may be laid on any part of the measure, and whose use is regulated by taste and feeling.

RHY'THMICAL MENTAL DISEASES. Certain affections become aggravated or mitigated at particular hours; certain others appear in paroxysms, to a certain extent of regular duration and recurrence; and a third class is named quotidian, quartan, &c., from the precise and unvarying periods at which their access returns. The element of time, and of regular intervals of time, is chiefly characteristic of morbid conditions of the nervous system. In chorea and involuntary shrieking, singing, &c., a rhythm may often be detected, of which the patient is altogether unconscious. Not merely have movements of the eyelids and of the limbs presented a perfectly timed succession, but cases are recorded where the wild gesticulations and jactations of St Vitus's Dance have been regulated so as to correspond to popular airs. A person has been known to strike his breast with the hand for hours with the same exactitude as if measured by a time-piece. Those affected with Tarantism are prompted to dance by the sound of music; and their movements are determined, it is affirmed, not by volition, but by the cadences of the tunes played in their hearing. The victims of the dancing mania in the 15th c. were similarly affected. In many forms of insanity, there is seen a tendency to rhiming in words, as well as to rhythmical movements. A patient for three consecutive days vociferated incessantly words terminating in *-ation*.—Laycock, *Nervous Diseases of Women*, pp. 185, 314; Sauvage, *Nosologia Methodica*, tomus ii. p. 231; *Medical Critic, passim*.

RIAZA'N, a central government of Great Russia, extends south-east from the government of Moscow. Area, 16,221 sq. m.; pop. 1,418,293. The principal river is the Oka, which, after forming the boundary between the governments of Moscow and Tula, and part of the boundary between Moscow and R., flows south-east to the middle of the latter, then turning north, disappears across the border on the north-east. The Oka divides the government into two unequal parts, of which the northern is low in surface and sandy in soil, while the southern presents an elevated surface and a most fertile soil. The Don crosses the south-west part of R., but is not here navigable. The chief products are iron ores, limestone, wheat, oats, rye, millet, buckwheat, and vegetables. There are many remarkably good studs. Though the chief occupations are agriculture and horticulture, there are a number of important industrial establishments, as needle, cloth, and glass factories; cotton-mills, iron-works, tanneries, and soap and tallow works. Manufactured goods and corn are exported.

RIAZAN, a town of Great Russia, capital of the government of the same name, stands on a branch of the Oka, near its junction with that river, 130 miles south-east of Moscow. It was founded in 1208, became in 1487 the residence of the princes of Riazan, and was made chief town of the government of R. in 1778. The chief fragment of antiquity is the interesting old fort called the Kreml. There is a ferry here across the Oka, at which the products of the vicinity are shipped: 5,770,000 bushels of corn are exported annually. Pop. stated at 22,279.

RIB, in Architecture, a projecting band or moulding on an arched or flat ceiling. It is of universal use in all styles of Gothic architecture; the early Norman examples are simple square bands crossing the vault at right angles, the groins being plain angles. In early English, the groins and ridge are also ribbed, and all the ribs are moulded. The ribs and their mouldings are multiplied as the style advances, till the whole surface becomes covered with them in the Fan-tracery Vaults (q. v.). Plaster ceilings are sometimes elaborately ornamented with patterns formed by ribs, especially in the styles of the times of Elizabeth and James I.

RIBBON, in Heraldry, a diminutive of the ordinary called the Bend, of which it is one-eighth in width.

RIBBON. See SILK MANUFACTURES.

RIBBON-FISH, the popular name of a family of acanthopterous fishes, called *Tæniidæ*, or, more properly, *Tænioidæ*, by naturalists (from *tænia*, a tape-worm), on account of their compressed and elongated form. Notwithstanding their peculiarity of form, they are nearly allied to the *Scomberidæ*, or Mackarel family. They are of very delicate structure, with naked and silvery skin, a long dorsal fin often uniting with the tail-fin, a small mouth, and a protractile snout. They are widely distributed from polar to tropical seas, but are nowhere found in abundance, being deep-sea fishes, and mere occasional visitants of the coasts. Owing to the delicacy of their frame, perfect specimens are seldom obtained. Species exist which are nine or ten feet long, not six inches high, and scarcely an inch thick. See BAND-FISH, DEALFISH, and GYMNETRUS.

RI'BBONISM, the name of a system of secret associations among the lower classes in Ireland, the objects of which have long been a subject of much suspicion and of considerable controversy. The

first origin of the associations known under this name is involved in much obscurity. From the middle of the last century, secret organisations, variously designated, but for the most part connected with agrarian discontent, have from time to time arisen in Ireland. The earliest of these appears to have been that of the Whiteboys, who appeared about the year 1759. Later in the century, the fierce and sanguinary strife to which the relaxation of some of the penal laws under which the Catholics had long suffered gave occasion in the north, and which resulted in the Protestant organisation already described under the head ORANGEMAN (q. v.), led to the Catholic counter-organisation known by the name of Defenders; but this association seems to have been for the time purely local, being confined to Armagh and the neighbouring counties, in which the violences of the Protestant party had originated. The severely repressive measures adopted by the government on the outbreak of the rebellion of 1798, and continued for several years, prevented any notable progress of the Catholic organisation; and when at length, about 1806, such an organisation was initiated, it was of necessity conducted with the utmost secrecy. The name by which the members of these associations were now known was 'Threshers.' They appeared chiefly in Sligo, Mayo, Leitrim, Longford, and Cavan; and it is worthy of note that one of their professed objects was to resist the payment of tithes, and even of the stipend commonly, although freely, paid to the Catholic priests by members of their congregations. The associations called (it is supposed from the badge worn by the members) by the name of Ribbon societies first appeared about 1808, and originated in Armagh, whence they spread to Down, Antrim, Tyrone, and Fermanagh. There can be no doubt that their real object was a combined action, partly for self-defence, partly also probably for directly antagonistic action against the now wide-spread and formidable Orange confederacy. Their operations from the first were for the most part limited to the counties, chiefly in the north and north-west, in which the Orange associations were sufficiently numerous to be formidable; nor do they appear at any time to have had a footing in the purely Catholic counties, where there were few or no Orangemen to be encountered. The secret associations of the other districts—the midland, southern, and south-eastern counties—as the 'Carders' in East and West Meath, in Roscommon, and part of Mayo; and the 'Shanavests' and 'Caravats' in Tipperary, Kilkenny, Cork, and Limerick, had little of the religious element in their organisation, being mainly due to discontents arising from alleged agrarian and social grievances.

The Ribbon association also, no doubt, addressed itself to the same agrarian and social grievances; but it is plain that its direct and immediate object was antagonism to the Orange confederation, to which, in some respects, it bore considerable resemblance, although it was deficient in that complete and wide-spread organisation which so remarkably distinguished the former body. The Ribbon association was divided, like the Orange, into lodges, and the members of each lodge were bound by a secret oath to 'be true to each other,' and 'to assist each other in all things lawful.' Stated meetings of the lodges were held, and small money contributions were exacted, both at entrance into the association, and on each occasion of meeting. The members, moreover, were known to each other by certain secret signs and pass-words, which were frequently changed, and some of the specimens of which were of a singularly absurd and ludicrous character. But there does not appear to have been anything like that complete and curious scheme of a 'Central Grand Lodge,' with its subordinate hierarchy of 'county,' 'district,' and 'private' lodges, which characterised the great rival confederation. A still more striking and important difference was in the class of men with which the Ribbon societies were recruited. They are proved to have consisted exclusively of the very lowest classes, the humbler peasantry, farm-servants, and operatives of the least intelligent class. No trace appears among them of what is so striking in the Orange Association—the co-operation, or even the countenance, of the gentry, the clergy, the commercial class, hardly even of the farming class, except a few of the sons of farmers of the lowest grade. On the contrary, an attempt which was made, in a committee of the House of Lords in 1839, to connect the Catholic clergy and the Catholics generally with the Ribbon association, proved a signal failure, as did also the attempt to shew that the objects of the association were the overthrow of British rule in Ireland; and it was proved that the Catholic clergy, from the first origin of these associations, have persistently opposed them, and employed all their influence, and even their spiritual authority, to deter their flocks from taking any part in them.

From the absence of all statistical information, and from the rude and illiterate material out of which alone these societies are formed, it is impossible to offer any estimate of their number or extent. That they still exist, becomes abundantly clear on every occasion of party-strife which arises in Ireland; but they appear to have been replaced in several parts of the country by newer associations, such as the 'Phenicians,' the 'Brotherhood of St Patrick,' and the 'Fenians,' an association which is said to possess large affiliations in America, and among the Irish population of the manufacturing towns of England and Scotland.

RIBEAUVILLE, a small manufacturing town of France in the department of Haut-Rhin, pleasantly situated amid vineyards, 34 miles south-south-west of Strasbourg. Excellent wines are made, and cotton goods are manufactured. The town is overlooked by the Vosges Mountains, along the crests of which runs a wall or rampart, built of unhewn stones, without cement, and from eight to ten feet high. It is of unknown antiquity, and is called the *Heidenmauer*, or Pagan wall. Pop. 7181.

RIBERA, JOSE, called SPAGNOLETTO ('the Little Spaniard') was born at Xativa, near Valencia, in 1588, and died at Naples in 1656 or 1659. He studied a few years with Francesco Ribalta, a Spanish painter of eminence, but resolved to visit Italy; and after working hard at Rome, and studying the greatest masterpieces in some other states, he went to Naples, where, attracted by the novelty and boldness of Caravaggio's style, he adopted it, and became the ablest painter among the *naturalisti*, or artists whose treatment of subjects was based on a vigorous and powerful, but generally coarse and vulgar representation of nature, in opposition to that formed on the study of conventional or academic rules. He settled in Naples, where he became court-painter, and executed numerous important commissions in that city; and it is there that his best works are to be seen. Salvator Rosa and Guercino are numbered among his pupils. He executed about eighteen or twenty etchings, all marked by force and freedom.

RIB-GRASS. See PLANTAGINEÆ.

RIBS are elastic arches of bone, which, with the vertebral column behind, and the sternum or breast-bone in front, constitute the osseous part of the walls of the chest. In man, there are 12

ribs on each side. The first 7 are more directly connected through intervening cartilages with the sternum than the remainder, and hence they are

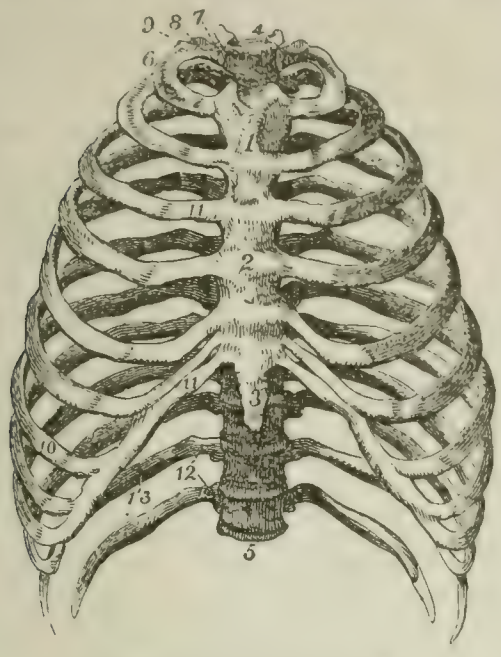

Fig. 1.—The Ribs, *in situ*:

1 and **2** are the upper and middle parts of the sternum or breast-bone; **3**, its ensiform cartilage; **4**, the first dorsal, and **5** the last (or twelfth) dorsal vertebra; **6**, the first rib; **7**, its head; **8**, its neck, resting against the transverse process of the first dorsal vertebra; **9**, its tubercle; **10**, the seventh or last true rib; **11**, The costal cartilages of the true ribs; **12**, the last two false ribs or floating ribs; **13**, the grooves along the lower border of the ribs (From Wilson's *Anatomist's Vade-Mecum*).

termed *vertebro-sternal* or *trué* ribs; while the other 5 are known as *false ribs*, and the last two of these, from being quite free at their anterior extremities, are termed *floating ribs*. A glance at a skeleton, or

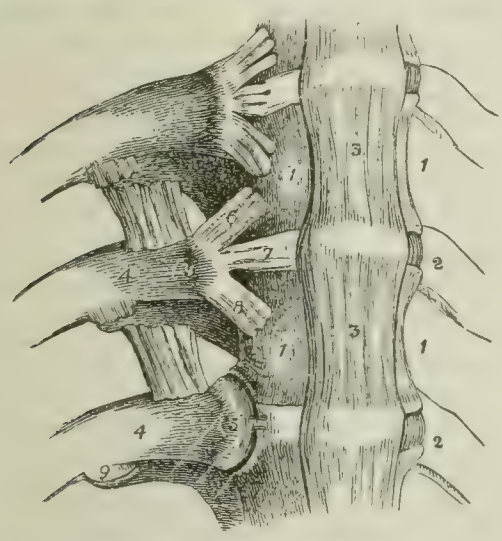

Fig. 2.—A Front View of the Articulations of the Ribs with the Spinal Column:

1, 1, Dorsal vertebræ; **2, 2**, intervertebral cartilages; **3, 3**, the anterior common ligament, extending like a riband along the whole of the front of the vertebral column; **4**, the neck, and **5** the head of rib; **6, 7, 8**, three flat bundles of ligamentous fibres, radiating from the head of the rib to the adjacent vertebræ and intervertebral substances (they are removed in the lowest rib, seen in the figure); **9**, the articulation between the tubercle of the ribs and the transverse vertebral process (From Gray's *Anatomy*).

at a plate representing the articulated bones, will shew that the ribs vary very considerably both in their direction and size. The upper ribs are nearly horizontal, but the others lie with the anterior extremity lower than the posterior; this obliquity increasing to the 9th rib, and then slightly decreasing. They increase in length from the first to the eighth, and then again diminish. The spaces between the ribs are termed the *intercostal spaces*. On examining a rib taken from about the middle of the series, we find that it presents two extremities (a posterior or vertebral, and an anterior or sternal), and an intervening portion, termed the body or shaft. The posterior extremity presents a head, a neck, and a tuberosity. The head is marked by two concave articular surfaces divided by a ridge, the lower facette being the larger. These surfaces fit into the cavity formed by the junction of two contiguous dorsal vertebræ, and the ridge serves for the attachment of a ligament. The neck is a flattened portion proceeding from the head; it is about an inch long, and terminates at an eminence termed the tuberosity or tubercle, from whence the shaft commences. On the lower surface of this tubercle is a small oval surface, which articulates (as shewn in figure 2) with a corresponding surface on the upper part of the transverse process of the lower of the two contiguous vertebræ. The shaft presents an external convex, and an internal concave surface. A little in front of the tubercle, the rib is bent inwards, and at the same time upwards, the point where this bending takes place being called the angle. The upper border of the rib is thick and rounded, while the lower border is marked by a deep groove, which lodges the intercostal vessels and nerve.

The ribs of Mammals are mostly connected, as in man, with the bodies of two vertebræ, and with the transverse processes of the posterior one. In the Monotremata, however, they articulate with the vertebral bodies only; while in the Cetacea, the posterior ribs hang down from the transverse processes alone. Their number, on each side, corresponds with that of the dorsal vertebræ. The greatest number, 23, occurs in the two-toed sloth, while in the Cheiroptera, 11 is the ordinary number. In Birds, each rib articulates by means of a small head with the body of a single vertebra near its anterior border, and with the corresponding transverse process by means of the tubercle. Moreover, each rib possesses a 'diverging appendage,' which projects backwards over the next rib, so as to increase the consolidation of the thoracic framework, necessary for flying. The dorsal vertebræ here never exceed 11, and are commonly 7 or 8 in number, and the ribs proceeding from them are connected with the sternum, not by cartilage, as in Mammals, but by true osseous sternal ribs, which are regularly articulated at one end with the sternum, and at the other with the termination of the spinal ribs. In the Chelonian Reptiles, the ribs (as well as the vertebra and the sternum) deviate remarkably from the normal type, the lateral parts of the carapace consisting mainly of anchylosed ribs united by dermal plates. In the Crocodiles, there are only twelve pair of true or dorsal ribs; while in the other Saurians, and in the Ophidians, the ribs are usually very numerous. In the Frogs, there are no true ribs; the reason probably being, that any bony element in their thoracic walls would interfere with the enormous thoracico-abdominal enlargement which these animals periodically undergo at the breeding period.

In the language of the transcendental anatomists, a rib is to be regarded as a *Pleurapophysis*—one of the elements of a typical Vertebra (q. v.).

RIBS, FRACTURE OF THE, is a very common surgical accident, resulting from blows or falls upon the chest. Ribs may, moreover, be broken by

mere pressure, as when persons are severely crushed in a crowd; and instances are on record in which, in the case of aged persons, the ribs have been actually fractured in violent coughing.

The treatment consists in the application of a broad flannel roller round the chest, so tightly as to prevent, as far as possible, all movement of the ribs, and to render the respiration abdominal rather than thoracic. The bandage must be prevented from falling by the addition of shoulder-straps; and in order to prevent the shoulder-blade from moving, and thus disturbing the broken ribs, some surgeons confine the arms to the side of the body. If one or both of the extremities of the fractured rib should perforate both the pleuræ, and wound the lung, air escapes in the act of inspiration from the lung into the pleural cavity, and from thence through the wound in the costal pleura into the cellular or areolar tissue of the trunk, giving rise to *emphysema*, in the form of a soft puffy tumour, that crepitates and disappears on pressure.

RICARDO, DAVID, a political economist and statesman, was born in London on the 19th of April, 1772. He was of Jewish extraction; and his father, who was a respectable member of the Stock Exchange, brought him up to his own business. There was an alienation between them on account of the son marrying out of the Jewish persuasion, and conforming to Christianity. Young R. practised in the Exchange until the year 1818, and whether from his own skill as a broker, or the favour extended to him on account of the position in which he was placed by his conformity, he realised a large fortune, preserving throughout his career in business an honourable reputation. While thus practically occupied, he was ardently working his way back to the first principles of political economy, and especially the finance department of it. In 1810, he produced a notable sensation by his pamphlet entitled *The High Price of Bullion a Proof of the Depreciation of Bank-notes*. The title was a condensation of the principle worked out in the treatise, which gave one of the earliest distinct announcements of the principle of a metallic basis, and the propensity that a paper currency always has to redundance, if it be not in some form or other restrained by the operation of such a basis. This was followed by several pamphlets, each in its turn a success in securing fame and influence. In 1817, appeared his principal work *On the Principles of Political Economy and Taxation*. He had previously in one of his pamphlets touched on the most important feature of this work—the elucidation of the true theory of rent, as not being incidental and casual, like the profits of stock, but a fund that must, under certain conditions of population, come into existence, whoever may draw it (see RENT). Some critics of R. found that the elements of the theory were given in *The Bee* by Dr Anderson (see ANDERSON, JAMES). R., however, who probably had not read *The Bee*, reached his conclusions in a different and original form, and from his happy method of elucidation, at once secured a general adhesion to the soundness of the theory, which was strengthened by comparing it with Anderson's remarks. R.'s work is one of the clearest and least tedious of all books on political economy. Like almost all works, however, written before free trade had been practically applied, it narrows the influence of the elements from which the riches of the world can be increased. Like Malthus, he was unable to anticipate the effect of an industrious people having the whole world for their market, and spoke of population outrunning subsistence, and the wages of labour being measured by the price of commodities. In 1818, he entered parliament, and kept his seat till his death. As he had a very clear method of announcing a principle, and being known as a successful man of business, his speeches had perhaps more influence in all matters of trade and money than those of any other member in the present century. He was a zealous student of geology, chemistry, and other sciences. He died on the 11th of September 1823.

RICASOLI, BETTINO, Baron, born at Florence 9th March 1809, is descended from a very ancient Lombard family, which established itself in Tuscany in the 13th century. R. studied at Pisa and Florence, and from an early period of his life was imbued with a desire to ameliorate the civil and religious condition of his country. His friends and associates were men like Poerio, Pepe, Coletta, Giordani, Nicolini, &c. But he was averse to revolution, and finding no legitimate opening for himself in political life, quietly subsided into a country gentleman, and set about 'improving' his estates. He is one of the best agriculturists in Italy, and has written on the cultivation of the vine, of the olive, and of the mulberry. His wines of Chianti have gained for him the cross of the Legion of Honour. In 1847, he appeared as a politician; but he hoped to obtain liberty and good laws from princes, and not from the people, and when Leopold II. fled to Gaeta, he retired from public life. Very soon, however, he joined with other Tuscan gentlemen, and after the defeat of Novara, he overthrew the government of Guerrazzi, and recalled the Grand Duke, trusting to the constitutional promises given by the latter. Leopold returned, accompanied by the Austrians; and R., indignant at this treachery, sent back his decoration to the prince, and shut himself up in his castle of Brolio—addicting himself more than ever to agricultural pursuits. For ten years he worked successfully at the drainage of the Tuscan Maremme (q. v.). In 1859, when Tuscany wished to take part in the war of Italian independence, R. reappeared. The Grand Duke fled, and R. was made dictator of Tuscany. After Villafranca, he remained alone in the government, beset by the French emissaries, who were advising him to recall Leopold II. R. fiercely refused to do so; he wished the annexation to Piedmont; and to those who spoke of the dangers he was incurring, he answered in those words, which history will never forget: '*Dopo Villafranca ho sputato sulla mia vita*' —literally, 'After Villafranca I have spit upon my life.' His obstinacy saved Italy, and produced the unity of the Peninsula. On the death of Cavour (1861), R. was called to the ministry, and by another abrupt and decided act, he promulgated political and administrative unity. His cabinet, undermined by Rattazzi, did not stand, and he therefore resigned (March, 1862). In June, 1866, he again assumed the directorship of the government as president of the Council and Minister of the Interior, but retired in April, 1867. See M. Luigi Passerini's *Genealogia e Storia della Famiglia Ricasoli* (Florence, 1861).

RICCI, MATTEO, a celebrated Italian, founder of the Jesuit missions to China, was born at Macerata, in the Marches of Ancona, October 6, 1552; and after studying law at Rome, entered the Society of Jesus in 1571. Six years later, he accompanied to India Père Valignan, 'Inspector-general of the Eastern Missions.' On account of his fine combination of zeal and tact, he was chosen by his superior to introduce a knowledge of the Christian religion into China, and after preparing himself for the arduous undertaking by a study of the Chinese language at the Portuguese settlement of Macao, he endeavoured to effect an entrance into the empire. But his first

efforts were vain, and it was not till 1583 that the Jesuit Fathers obtained permission to settle at Tchao-king-fu. R. quickly saw that it was hopeless to attempt the conversion of the Chinese except by accommodating himself to their intellectual tastes and beliefs, as far as the principles of his religion permitted. Aware of the value which the ruling class—the mandarins—attached to literary skill, he executed and published a Chinese *Map of the World*, and also a little *Catechism*, in which he set forth only such portions of Christianity as embody the general principles of morality. These two productions won R. a high reputation among the Chinese *literati;* the most illustrious mandarins came to visit him, and expressed their esteem for his character and talents. In 1595, he boldly resolved to go to Peking, believing that he could accomplish far more as a religious propagandist in the metropolis than elsewhere. Having obtained permission from his superiors to assume the dress of a Chinese scholar, he set out in the train of a mandarin, who did not allow him, however, to proceed further than Nanking. Expelled thence, he was obliged to return homeward; but at Nan-tchang-fu, the indomitable and adroit priest composed two treatises, entitled the *Art of Memory*, and a *Dialogue on Friendship*, in imitation of Cicero, which so pleased the taste of the Chinese, that they ranked them along with their most esteemed books, and the fortunate author was allowed to proceed north. He reached Peking, and although he could not obtain an interview with the sovereign, he was permitted to fix his residence at Nanking, the second city in the empire, where his fame as a scholar increased from day to day. In 1600, he and his companions were allowed to settle at Peking, and even to build a church. He spent the remainder of his life in teaching mathematics and other sciences, in writing works of a secular as well as a religious kind, and in using his great influence with the king, the court, and the learned classes generally to obtain a favourable attention to the claims of that religion which he represented. R. made several striking conversions, and through his zeal, missionary establishments were set up in the principal cities of China. He died May 11, 1610, and was universally mourned. In the annals of the Chinese empire, he is designated sometimes *Li-ma-teou*, and sometimes *Si-thaï*. The most important (for us) of his numerous writings are his Memoirs, published by Père Trigault, under the title of *De Christiana Expeditione apud Sinas suscepta ab Societate Jesu, ex M. Riccii Commentariis Libri V.* (Augsb. 1615; Lyon, 1616), which contains a vast number of valuable observations on the geography and history of China. The family of R. possess 66 interesting letters of the great missionary.

RICCIO or RIZZIO, David, an Italian of considerable ability and accomplishments, who, in the reign of Mary Stewart, Queen of Scots, came to Edinburgh in the train of the ambassador from Savoy. His first employment at court was as a musician; but his skill and fidelity led Mary to advance him to the post of her French secretary, about the time of her marriage with Darnley; and in this situation he was believed to possess considerable influence over the queen. His advancement was distasteful to the nobles in general, but more especially to the party of the Reformers, who suspected him of intriguing with the papal court. He became obnoxious on other grounds to Darnley and his father, the Earl of Lennox. The former, who had for a time been on the most friendly footing with him, was easily led to believe not merely that he was the real obstacle to his favourite design of having the crown settled on him and his heirs, but also that he had supplanted him in the affections of the queen. In this belief, he entered into a compact with the leaders of the Protestant party—including Murray, Ruthven, Morton—to assassinate R., and slay even in the queen's palace and presence whoever opposed them. Darnley formally bound himself to prevent the attainder of the conspirators, and procure their pardon, and to support and advance the Protestant faith, while the conspirators in return obliged themselves to procure the wished-for settlement of the crown in his favour. Accordingly, on the 9th March 1566, when Mary, then seven months with child, was sitting at supper in a small cabinet adjoining her bedroom, at Holyrood, attended by the Countess of Argyle, the Commendator of Holyrood, Beaton Master of the Household, Arthur Erskine, Captain of the Guard, and R., the king led the conspirators up a secret stair, while the Earl of Morton, with a troop of soldiers, seized the gates of the palace. Led by the king, the conspirators burst into the cabinet, overturned the table, and threw themselves on R., who sprang for protection behind the queen. Ruthven drew his dagger; Ker of Fawdonside, it is said, held a pistol to the queen's breast; while George Douglas, natural son to the Earl of Angus, snatching the king's dagger, stabbed R. over the queen's shoulder, and dragging him from the cabinet, despatched him in a pool of blood, in the adjoining apartment, with fifty-six wounds. This murder was the first of the series of tragic events in which Mary Queen of Scots was involved. John Knox, in his *History of the Reformation*, characterises it as 'a just act, and most worthy of all praise.'

RICE (*Oryza*), a genus of grasses, having panicles of one-flowered spikelets, with two very small pointed glumes; the florets compressed, the paleæ strongly nerved, awned or awnless, six stamens, one germen, and two feathery stigmas. The only important species is the Common R. (*O. sativa*),

Rice (*Oryza sativa*).

one of the most useful and extensively cultivated of all grains, supplying the principal food of nearly one-third of the human race. It seems to be originally a native of the East Indies, but is now cultivated in all quarters of the globe, and almost wherever the conditions of warmth and moisture

are suitable. It is adapted to tropical and sub-tropical climates, rather to the latter than the former; and requires much moisture, rather, however, in the soil than in the air. R. is an annual, varying from one foot to six feet in height. There are many other distinguishing characters of the varieties in cultivation; some having long awns, and some being awnless; some having the chaff (*palea*), when ripe, yellow, white, red, black, &c. The seed or grain of R. grows on little separate stalks springing from the main stalk; and the whole appearance of the plant, when the grain is ripe, may be said to be intermediate between that of barley and of oats. R. requires a moist soil, sometimes flooded; and the cultivation of it has in many places been attended with an increase of intermittent fevers, and of general unhealthiness, the rice-fields being artificially flooded at certain seasons. The cultivation of R. is most extensively carried on in India, China, Cochin-China, and other south-eastern parts of Asia, Japan, Egypt, South Carolina, Georgia, and other southern states of North America. The quantity annually raised in India is about 28,000,000 bushels, valued at $12,923,000. The product of South Carolina, in 1860, was 162,000 tierces, or 119,100,528 pounds, valued at $4,000,000. In 1870–71, the rice crop of Louisiana was estimated at 47,971 barrels, or nearly 10,000,000 pounds. In Carolina R. is either drilled and covered or sown broadcast in carefully plowed and harrowed alluvial land, and then flooded with water to the depth of several inches till the seeds germinate; the water is then drawn off, and afterwards the fields are again flooded for rather more than a fortnight, to kill weeds. They are flooded again, when the grain is near ripening. —In Europe, the cultivation of R. is confined to the most southern regions. It is most extensively carried on in the plains of Lombardy, and in Valencia in Spain. Attempts have been made to cultivate it in more northern parts of Europe, but without success. Marshy situations, where there is always the same abundance of water, are not so suitable to R. as those in which the supply of water is regulated according to the season and the growth of the plant.

Like most cultivated plants, it is very liable to variation, and in India and Ceylon at least, 120 known varieties are cultivated. The best of all R. known in the market is that of Carolina, yet the introduction of R. into that country took place only about the last years of the 17th or the first of the 18th century. Its cultivation there, however, rapidly extended.

R. is known in India as *Paddy*. Another use of this name is to designate R. in the husk.

In China, R. is generally sown pretty thickly on very wet land, and afterwards transplanted to the land which it is finally to occupy. The plants *tiller* or spread at the root very much, so that each sends up several or many stalks. The rice-grounds are carefully kept clear of weeds, although often so wet that a man cannot walk in them without sinking to the knees. In many parts of China, and in other warm countries, it is common to obtain two crops of R. in a year.

R. is shelled and quickly dried before being brought to market. Good Indian R. has the following composition:

	Per cent.
Moisture,	13·00
Nitrogenous Matter,	7·44
Starch,	77·63
Fatty or oily matter,	0·70
Ash,	1·23
	100·00

R. contains, therefore, according to the prevalent views of modern chemists, a smaller amount of *flesh-forming* substances, and a larger amount of *fat-forming* or *heat-giving* substances than any other grain. As a food, it is peculiarly well adapted for hot climates, as it appears to be almost a cure for dysentery and other bowel complaints, independently of which it is a sufficiently nutritious food without being heating. Owing to the small quantity of gluten which it contains, it is capable by itself only of an imperfect fermentation, and is unfit for being baked into bread. It is, however, subjected to fermentation in many countries. The beer made from R. by the Japanese is called *Saki*, and is in general use among them; but before being drunk, it is heated in kettles. Several kinds of *Rice wine* are made by the Chinese, some of them highly esteemed, and very intoxicating. A spirit is distilled from the lees, called *Shou-choo* or *Sam-choo*. The common Arrack (q. v.) of the East is made from rice, and rice is also employed to a very great extent by distillers in Britain.

Rice Starch is made in considerable quantity in Britain. It is sold under the name of *Patent Starch*, and is used in laundries and muslin manufactories. —The straw of R. is used to make straw-plait for bonnets.

The refuse of R., which remains when it is cleaned for the market, and consists of the husk, broken grains, and dust, is valuable as food for cattle. It is known as *Rice-meal* and *Rice-dust*.

CANADA R. (*Zizania aquatica*), the WILD R. of North America, is a species of grass quite different from the true R., and of a different genus. It is common in North America, and particularly abundant in the north-western parts of it; growing in miry places or shallow water, often in the margins of lakes. It has a culm 7—8 feet high, with broad diffuse leaves, and a large terminal panicle of male flowers, with a spike of female flowers at the summit. The flowers have six stamens. The seeds are about half an inch long, slender, farinaceous, affording very good meal, and much used by the Indians where the plant abounds. Attempts to introduce this plant into Britain have hitherto proved unsuccessful; but there are many northern regions apparently more suitable to it, and it has not received all the attention it deserves.

RICE-PAPER. See PAPER.

RICHARD I., king of England, surnamed CŒUR DE LION, was the third son of Henry II. by his queen Eleanor. He was born at Oxford in September 1157. In the treaty of Montmirail, entered into 6th January 1169, between Henry and Louis VII. of France, it was stipulated that the duchy of Aquitaine should be made over to R., and that he should do homage for it to the king of France; also, that he should marry Adelais, youngest daughter of Louis. In 1173, R. joined his mother and his brothers Henry and Geoffrey in their rebellion against the king. The rebels submitted in September 1174, when two castles in Poitou were allotted to Richard. In 1183, a second family feud broke out in consequence of R. refusing to do homage to his elder brother Henry for the duchy of Aquitaine. In this war, his father sided with R. against Henry and Geoffrey. It was ended by the death of Prince Henry, when R., actuated probably by jealousy of his youngest brother John, declared himself the liegeman of France for his possessions in that country. This step led to a war between the king of England and Philip of France, in which R. fought against his father. The balance of success being decidedly with France, a treaty in accordance with this fact was about to be executed, when, by the death of Henry II., on 6th July 1189, R. became

king of England. He landed in his own country on 15th August 1189, and was crowned in Westminster Abbey on the 3d September following. In the hope of gaining salvation, and with the certainty of following the occupation which he loved best, he now set out with an army to join the third crusade, then about to leave Europe. He united his forces to those of France on the plains of Vezelai, and the two armies (numbering in all 100,000 men), marched together as far as Lyon, where they separated and proceeded by different routes to Messina, where they again met. Here R. betrothed his nephew Arthur to the infant daughter of Tancred, king of Sicily, with whom he formed a close alliance. The Sicilian throne was at that time claimed by the Emperor Henry VI.; and the alliance with Tancred, from this cause, afterwards turned out a very unlucky one for Richard. Having settled a difference which now arose between him and Philip respecting his old engagement to Philip's sister Adelais, the English king, on 7th April 1191, sailed from Messina for Cyprus, carrying along with him Berengaria, daughter of Sancho VI., king of Navarre. He had fallen in love with this princess, and he married her in the island of Cyprus, where he halted on his way to Palestine. But even love did not make him forget his favourite pastime of war: he attacked and dethroned Isaac of Cyprus, alleging that he had ill-used the crews of some English ships which had been thrown on his coasts. Having then presented the island to Guy of Lusignan, he set sail on 4th June 1191, and on the 10th of the same month he reached the camp of the crusaders, then assembled before the fortress of Acre. The prodigies of personal valour which he performed in the Holy Land have made the name of Richard the Lion-hearted more famous in romance than it is in history. The man was the creation and impersonation of his age, and the reader who follows his career may perhaps be more interested than he would be by the lives of greater men, or by the history of a more important period. On 9th October 1192, he set out on his return to England. After some wanderings and adventures, he became the captive of the Emperor Henry VI., who shut him up in a castle in the Tyrol. John, meanwhile, ruled in England, and he and Philip of France had good reasons for wishing that R. should never return to his kingdom. He disappointed them; not, however, until he had paid a heavy ransom, and even, it is said, agreed to hold his kingdom as a fief of the empire. On 13th March 1194, he found himself once more in England. His brother John, who had acted so treacherously towards him, he magnanimously forgave, but with Philip of France he could not deny himself the pleasure of a war. In the contest which followed he was generally victorious, but in the end it proved fatal to himself. He was killed by an arrow shot from the castle of Chaluz, which he was besieging, on 26th March 1199. If R. had the vices of an unscrupulous man, he had at least the virtues of a brave soldier.—See *Chronicles and Memorials of Richard I.*, by W. Stubbs, from MS. in Lib. of Corpus Christi Col., 1864

RICHARD PLANTAGENET, second son of John, king of England, was born on 5th January 1208. In 1226, he was created Earl of Cornwall by his brother Henry III. In 1232, he put himself at the head of the party opposed to Hubert de Burgh, whose influence was at that time supreme in the councils of the king. Immense wealth, a calm, practical temperament, and a shrewd eye for his own worldly interest, were the elements which combined to make R. P. a considerable power in the state. His influence prevailed, and De Burgh was driven from his position with loss both of honours and estate. In 1256, R. P. was elected titular king of the Romans; and though his election was disputed, he was crowned at Aix-la-Chapelle. Subsequently, he exercised some of the nominal rights which belonged to his sovereignty. In the great struggle which took place between Henry III. and his nobles, R. P. at first acted the part of a mediator; subsequently, however, he took a decided part with his brother against the party which was headed by Simon de Montfort; and on 14th May 1264, he was taken prisoner by that leader at the battle of Lewes. De Montfort shut him up in Kenilworth Castle, from which he was released at the end of a year. The rest of his life does not seem to have been marked by any event of historical importance. He was thrice married: in 1230, to Isabel, daughter of the Earl of Pembroke; in 1243, to Sanchia of Provence, sister of Queen Eleanor; and in 1267, to Beatrice, daughter of Theodoric de Falkmonte. He died on the 2d of April 1272. His character seems to have been unmarked either by great virtues or great vices.

RICHARD II., king of England, the second son of Edward the Black Prince and Joanna of Kent, was born at Bordeaux on 3d April 1366. He succeeded to the throne on the death of his grandfather, Edward III., 28th June 1377. He being a minor, the government was vested in a council of twelve, from which were excluded the king's three uncles, John of Gaunt, Duke of Lancaster; the Earl of Cambridge, afterwards Duke of York; and the Earl of Buckingham, afterwards Duke of Gloucester. This arrangement is, however, supposed to have been collusive, and intended to lull the popular suspicion of Lancaster, under whose control the council really was. The reign of R. is interesting to the student of English constitutional history. We find the recently-established House of Commons eagerly pressing forward to procure a share of political power, by means of the efficient engine of which it had then acquired the sole control—the right of taxation. Again, we find the labouring classes now beginning to aspire to be freed from the state of bondage in which they had hitherto been kept. The famous capitation tax, imposed in 1380, gave rise in the following year to the rebellion of Wat Tyler (q. v.). In June 1382, R. was married to Anne of Bohemia, daughter of the Emperor Charles IV. The next two years were occupied with a war with France, transferred in 1385 to Scotland, where for a while the king conducted it in person. In the absence of John of Gaunt in Spain, the Duke of Gloucester had put himself at the head of affairs; and an attempt which R. made at this time to free himself from control having been defeated, several of his counsellors were put to death, which step, on the part of the victorious party, was approved of by parliament, by whom further executions were ordered among the king's adherents; and the sentences were carried into effect. In 1389, however, R., by a sudden movement, succeeded in throwing off the yoke. Gloucester was obliged to retire; but from indolence and want of capacity, the king soon allowed the reins of government to slip from his own hands into those of the Duke of York, and Lancaster's son, Henry of Bolingbroke. In 1394, the queen died, and soon after a marriage treaty was concluded between R. and Isabella, infant daughter of Charles VI. of France. Gloucester reprobating this marriage, which seems to have been unpopular, R. caused him to be privately arrested and conveyed to Calais, where he died, or was murdered, as has been conjectured. On the meeting of parliament, the king had his own way; the Earl of Warwick was banished, and the Earl of Arundel beheaded. Having triumphed over

his foes, R. now began to quarrel with his friends. A misunderstanding having taken place between Bolingbroke and Mowbray, Duke of Norfolk, the king, desirous to be rid of both, sent the former into banishment for ten years, and the latter for life. But Bolingbroke had been assiduously cultivating the popularity which his cousin had been as assiduously throwing away; and the result became apparent in 1399. On his return, in that year, from a military expedition in Ireland, R. found that Bolingbroke had, in his absence, landed in England; that he had soon found himself at the head of a formidable army, and that the Duke of York had yielded and gone over to his side. The army which the king had had with him in Ireland, also, no sooner landed than it almost entirely passed over to the invader. R. found himself without force or friend, while Bolingbroke, now styling himself Duke of Lancaster, was at the head of 80,000 men. Meeting the conqueror at Flint Castle, R. was carried captive in his train to London. On 29th September 1399, he formally resigned his crown. On the following day, the resignation was ratified by parliament, and the crown conferred on Lancaster. By order of the peers, R. was confined secretly in a castle, but where is not known. In the February following his resignation, the nation was told that he was dead, and his body, or what was supposed to be it, was brought with much pomp from Pontefract Castle, and shewn to the people. There were rumours at the time of his having been murdered, and long afterwards of his being alive and in Scotland. But nothing really authentic is known regarding the end of Richard II.

RICHARD III., king of England, was the youngest son of Richard Duke of York, and the great-grandson of Edmund Duke of York, the fifth son of Edward III. R. was born at Fotheringay Castle on 2d October 1452. On the defeat and death of their father in 1460, he and his brother George, afterwards Duke of Clarence, were sent by their mother to Utrecht, where they remained for a short while under the protection of the Duke of Burgundy, until the crown was won by their eldest brother, Edward IV. In 1470, R. along with Edward remained in Flanders, whither they had fled on the success achieved for Margaret of Anjou by the Earl of Warwick. In 1471, he led the van of his brother's army at Barnet; he also rendered efficient assistance at the crowning victory of Tewkesbury. It is said that he and Clarence murdered Prince Edward, son of Henry VI., after the battle. It has also been popularly believed that he murdered Henry himself in the Tower. Now Duke of Gloucester, in 1472 he married Lady Anne Neville, daughter of Warwick, and widow of Prince Edward. He has been generally accused of complicity in the judicial murder of his brother Clarence in 1478, and Shakspeare has placed the charge almost beyond the power of historical criticism to efface. The evidence, however, seems to be almost null. In 1483, on returning from an expedition into Scotland, he heard of the death of his brother the king. He met the Duke of Buckingham at Northampton, where it is believed that those measures were concerted which resulted in the execution of Hastings and others, the confinement in the Tower of the infant children of the late king, and the placing of the English crown on the head of Richard III. His reign dates from 26th June, 1483. He was crowned at Westminster on the following 6th of July. For some time he seems to have been really popular. He was well received on a tour which he made in the northern counties. On reaching York, however, on his return, he heard of a formidable insurrection which had broken out in the south in favour of his nephew, Edward V. But the bold and remorseless nature of R. was on this occasion triumphant. It was soon known over the land that the royal children were dead. Little doubt has ever been held that they were murdered, or that the deed was done at the instigation of their uncle. The insurrection was quelled, and Buckingham, who had been at the head of it, found guilty of treason and executed. The parliament, which met on 23d January 1484, declared the issue of the late king to be bastard, and the property of the late rebels confiscated. R. now offered to marry the Princess Elizabeth, daughter of Edward IV., to his eldest son, Edward, on whose premature death he offered to marry the princess himself, his own queen being still alive. On the death of Anne, however, supposed to have been murdered by poison, on 16th March 1485, R.'s counsellors dissuaded him from marrying Elizabeth, on the ground of the popular indignation which the step was sure to excite. Meanwhile the crimes which his ambition had already led him to commit, had excited the deepest disgust both among nobility and people. One by one his adherents were dropping off, and crossing to France to join the Earl of Richmond. At last the storm burst. On the 7th August 1485, Richmond landed at Milford Haven. On the 21st of the same month was fought the decisive battle of Bosworth. It deprived Richard both of his crown and life, and decided the long war of the Red Rose and the White in favour of the House of Lancaster. R. was doubtless a man of great energy and ability, but in his aims, selfish and unprincipled. It must, however, be kept in view that his age was one in which human life was held of little value, and deception regarded almost as an accomplishment. See Life by J. H. Jesse (London, 1862).

RICHARD OF CIRENCESTER—in Latin, *Ricardus Corinensis*—a well-known early English chronicler, was born at Cirencester, in Gloucestershire, in the first half of the 14th c., but nothing whatever is known of his family or circumstances. In 1350, he entered the Benedictine monastery of St Peter, Westminster—whence he is sometimes called the 'Monk of Westminster'—and remained there for the rest of his life. His leisure was devoted to the study of British and Anglo-Saxon history and antiquities. In the prosecution of his investigations, R. is said to have visited numerous libraries and ecclesiastical establishments in England, and we know for certain that in 1391 he obtained a licence from his abbot to visit Rome. He died in 1401 or 1402. R.'s principal works are *Historia ab Hengista ad Ann.* 1348, in two parts, of which the first (preserved in the public library of Cambridge) treats of the affairs of England from the Saxon invasion to the death of Harold; two theological productions (in the Peterborough library), a *Liber de Officiis Ecclesiasticis*, and a *Tractatus super Symbolum Majus et Minus;* and above all his *De Situ Britanniæ*, a treatise on the ancient state of Great Britain. This work—of which, however, it must be admitted that the authenticity is doubtful—was, curious to say, first brought to light by Dr Charles Julius Bertram, professor of English at Copenhagen, in 1747, who professed to have discovered it in the Royal Library there, and who sent a transcript of it, together with a 'fac-simile' of the original, to the celebrated English antiquary, Dr Stukeley. This gentleman published an analysis of it in 1757, and in the same year Professor Bertram published the whole treatise, along with the 'remains' of Gildas and Nennius, under the title *Britannicarum Gentium Historiæ Antiquæ Scriptores tres, Ricardus Corinensis, Gildas Badonicus, Nennius Banchorensis.* A

new edition with an English translation and a 'fac-simile,' and a biography of the supposed author, appeared at London in 1849, and a reprint forms one of the 'Six Old English Chronicles' in Bohn's 'Antiquarian Library' (1848). If we could feel quite sure that the work was genuine, it would be of the highest importance for the study of British and Roman-British antiquities, but unfortunately Bertram's 'original' (like the 'original' of Macpherson's *Ossian*, and Joe Smith's *Book of Mormon*) is not to be found, nor does it appear that anybody ever saw it but himself, so that Gibbon's praise, 'that he [Richard] shews a genuine knowledge of antiquity very extraordinary for a monk of the 14th century,' must be regarded with suspicion.

RICHARDSON, Samuel, the first great English novelist, was born in Derbyshire in the year 1689. His father, though originally connected with a higher grade of society, was a joiner. It was his ambition to educate his son for the church; but for this the means were found deficient, and at the age of 17, with simply such an education as a country school could then furnish, the young man fared forth to London, where he became apprentice to one John Wilde, a printer. In the discharge of his business duties he was exact and careful, and on the expiration of his apprenticeship he became foreman of Mr Wilde's establishment. Some years afterwards, he started as printer on his own account in Salisbury Court, Fleet Street; and on finding his success assured, he wedded Miss Allington Wilde, the daughter of his late employer. After her death in 1731, he was again married to a Miss Leake. By each lady he was blessed with six children, of whom only four daughters along with their mother survived him. Throughout life, in his business relations, he was prosperous; very early he had influence to secure the lucrative post of Printer of the Journals of the House of Commons; in 1754, he became Master of the Stationers' Company; and in 1760, he purchased the moiety of the patent of King's Printer; but died on 4th July of the year following.

Richardson's genius flowered late. Till he had turned 50, his relations with literature, except in the way of printing it, were of the most slight and amateur kind; but in 1740 he surprised the world with his *Pamela*, which had instant and great success. Its continuation, to which the author was stung by the attempt of some hungry scribe to make a meal or two by the issue of a pretended sequel, entitled *Pamela in High Life*, was, however, pronounced much inferior. Memorable in itself, the work is now to most readers more so, as having suggested to Fielding his *Joseph Andrews*, originally conceived as a parody of Richardson's somewhat prudish moralities. The exquisiteness of the satire was not appreciated by Richardson; and he never forgave Fielding for it, or could speak of him after with common temper or patience.

In 1748, he issued the first four volumes of *The History of Clarissa Harlowe*—by common consent his masterpiece—a work which in its progress to completion excited the most intense interest. His third and last great work, *The History of Sir Charles Grandison*, was published in 1753. As a whole, this is less interesting than its predecessors; and in his representation of the life of the fashionable classes, of which he had no clear personal knowledge, the writer succeeds but indifferently.

R.'s method of minute elaboration has in itself some tendency towards an effect of tedium; moreover, the epistolary vehicle which he has chosen, though with certain advantages of its own, does not subserve rapidity of movement; and as his stories run to immense length, their perusal involves some effort of patience. But in the depth and simplicity of his sentiment, his profound knowledge of the heart, and mastery of elemental emotion, there are singular sources of attraction; and in virtue of the overwhelming effects of pathos in which the interest of his *Clarissa* culminates, a place must always be assigned him among the very few potent masters of genuine tragic passion. His specialty lies in subtle analysis of the intricacies of female mind and emotion; and in this particular field he has scarcely perhaps been surpassed. A curious sort of passionless confidential intimacy with women, it seems from his earliest years to have been his instinct to cultivate; throughout life he was the centre of a circle of female friends and admirers, who came to him with their little delicate secrets, as to a kind of lay father-confessor; and of the fruits of his nice observation of them he has given us to the full in his novels. The success of these is said to have bred in him a somewhat inordinate vanity, the only little flaw in a character unusually blameless and amiable. Of works of less importance he published, besides occasional contributions to periodicals, *The Negotiations of Sir Thomas Roe in his Embassy to the Ottoman Porte from* 1621 *to* 1628 (1740, fol.); *An Edition of Æsop's Fables, with Reflections; Familiar Letters to and from several Persons on Business and other Subjects;* and in 1804 there appeared his *Correspondence Selected and Published, with a Biography by Anna Letitia Barbauld.*

RICHARDSON, Sir John, K.C.B., M.D., LL.D., &c., a celebrated traveller and naturalist, was born November 5, 1787, at Dumfries, of which town his father, Gabriel Richardson, Esq., was several years provost. In his 14th year, he left the Academy of Dumfries to study at the University of Edinburgh, with a view to the medical profession. After obtaining his diploma, R. entered the royal navy, and in 1807 was appointed assistant-surgeon to the *Nymphe* frigate, in which he was present at the battle of Copenhagen. Sometime later, the *Nymphe* was engaged in the blockade of the Tagus, when, after twice volunteering to go in the boats on cutting-out expeditions, R. was transferred to the flag-ship. After the convention of Cintra the ships left the Tagus, and R. was nominated to the *Blossom* sloop of war, in which he served on the coast of Africa, Lord Exmouth removing him to the *Bombay*, 74, in 1810. His next services were in the *Cruiser*, on the Baltic and North Sea stations; afterwards surgeon of the 1st battalion of Royal Marines, stationed in Canada, and later doing service in Georgia, R. having charge of the hospital ship for the sick and wounded of the brigade. His next appointment, 1819, was that of surgeon and naturalist to the overland expedition under Franklin. In 1822, R. returned to England, and early in 1824 became surgeon to the Royal Marines at Chatham. In 1825—1827, he accompanied Franklin in his overland expedition to the mouth of the Mackenzie, and by orders of the Admiralty was detached to survey the coast between that river and the Coppermine, executing the task with singular success and ability. On returning from this expedition, R. resumed his duties at Chatham, remaining there till his promotion, 1838, to be physician of Haslar Hospital, and inspector of naval hospitals and fleets. In 1846, R. received the honour of knighthood; and two years later, moved by genuine friendship and unsurpassed self-devotion, set out to search for and if possible save his former travelling companion, Sir John Franklin, of whom nothing had been heard for upwards of two years. On March 25, 1848, R., accompanied by Mr Rae, departed from Liverpool

to look for the missing expedition between the Mackenzie and Coppermine Rivers. Landing at New York, R. hastened by way of Montreal and the Canadian lakes to the head-waters of the Mackenzie, which he descended, and then turned eastward by Capes Bathurst and Parry. Contrary to former experience, the sea towards Cape Krusenstern was found closely packed with dangerous drift-ice. After immense labour the party reached Cape Hearne, where it was found necessary to abandon the boats, and after 12 days' fatiguing march, through half-frozen swamps and over hills covered with snow, succeeded in gaining Fort Confidence, at the north point of Great Bear Lake. Here R. spent the winter in scientific observations, returning to England in 1849, and resuming his duties at Haslar. In 1855, R. tendered his resignation, after 48 years of almost unexampled activity in the public service. Moved in all his actions by a high sense of honour and sincere piety, possessed of the most unselfish nature, and a mind so acute as almost intuitively to form correct judgments, united with the humble and loving disposition of a child, R., during his long career, was one of the most lovable as well as useful men of the present century. Up till his death, 5th June 1865, he possessed much of the elasticity of youth; and whenever a scientific society assembled, he was found leaving for a time his quiet home by the Lake of Grasmere to take part in the deliberations.

R. was a fellow of the Royal Societies of London and Edinburgh, of the Royal Geographical Society, member of the Geographical Society of Paris, and of many other literary and scientific bodies in Great Britain, the continent of Europe, and America. He contributed largely to the account of Franklin's first expedition (Lond. 1823); and to that of the second expedition (Lond. 1828). In 1836, appeared *Fauna Boreali-Americana, The Fish'; A Boat Voyage through Rupert's Land and the Arctic Sea* (Lond. 1851); *The Polar Regions* (1861). Besides zoological appendices to the voyages of Parry, Ross, Back, &c., his contributions to the Journals and Transactions of various societies have been very numerous. A recent work is the *Museum of Natural History*, in conjunction with several other distinguished naturalists.

RICHELIEU, Armand Jean du Plessis, Cardinal, Duc de, was born of a noble but impoverished family at Paris, September 5, 1585, and was educated for the military profession at the College de Navarre. On the retirement to a religious life, however, of his elder brother, who held the bishopric of Luçon, R., with a view to succeeding to this preferment, betook himself to ecclesiastical studies, and underwent the preliminary examination for his degree at the Sorbonne. In 1607, he was consecrated Bishop of Luçon at Rome by Cardinal de Givry, in presence of Pope Paul V., and for some time devoted himself zealously to the discharge of his duties in his diocese. At the States-General in 1614, being appointed one of the representatives of the clergy, he attracted the notice of the queen-mother by an address which he delivered in the presence of the young king, Louis XIII.; and by his appointment in 1616 as secretary at war and foreign affairs, the way seemed opened to his success in political life; but in one of the vicissitudes of state intrigue common at that period, he soon found it necessary to withdraw from court, and return to his diocese. Meanwhile, a rupture occurred between the queen-mother and the king, and R., through the agency of a very remarkable man—the celebrated Capuchin Father Joseph—whose fortunes thenceforward were inseparably united with those of R., succeeded in effecting their reconciliation (August 1620), and the restoration of the queen to her position at court. The foundation of R.'s influence in consequence was solidly laid; but he appears to have acted with much tact and patient forbearance. He formed an alliance with the powerful favourite, the Duc de Luynes, and in 1622 was named cardinal, and two years later, 1624, he was made minister of state—a position which, although frequently menaced, and constantly beset by every variety of court intrigue, he retained to the end of his life. His first important measure was the conclusion of the alliance with England, by the marriage of Henrietta, sister of the king, with Charles, then Prince of Wales, in 1624. His successful conduct of the war of the Valteline, an affair of much delicacy for a cardinal, as presenting the pope himself as the antagonist of France, tended still more to strengthen his power. His enemies, however, were constantly on the watch for opportunities of undermining his influence, and even of bringing about his death. The queen withdrew her favour, and the king, while he trusted him implicitly, never ceased to fear him. The crisis of the struggle took place December 11, 1630, when R. himself believed that his fate was inevitable. His disgrace, indeed, had been decided; the king, fearing to meet him face to face, had refused him an audience. His attempts to force an entrance to the king at the Luxembourg were defeated; but Louis, in his weak fear of R., having withdrawn to Versailles, the cardinal there succeeded in obtaining an audience, and having once effectually overborne the weakness and alarmed the fear of the sovereign, his supremacy remained from that day firmly and irrevocably established. This famous day is known as *La Journée des Dupes.*

The administration of R. forms an epoch in the history of the constitution of the kingdom of France, as well as of her relations with other countries. It is memorable for several great measures, or series of measures, through which the posture of affairs underwent a complete and permanent change. Of these, the first and the most lasting in its results was that by which the absolute authority of the sovereign was established. From the medieval period, the power of the French kings had been controlled, and in many cases overridden by the feudal privileges of the nobles; and in the stormy conflicts of the 16th and of the beginning of the 17th centuries, the power of the crown had often been reduced to a cipher. By a succession of vigorous and energetic, and it must be added not unfrequently unscrupulous measures, R. succeeded in breaking down the political power, and subduing the arrogant assumptions of the great families; the heads of several among which were brought to the scaffold, while not a few were condemned to life-long imprisonment. Among his most inveterate and most powerful adversaries was Gaston, Duke of Orleans, brother of the king; but R. triumphed over him, and even the queen-mother, Marie de Médicis, was obliged to bow before the unbending spirit of R., and to withdraw into exile at Cologne; and R., at the close of his career, delivered up the royal authority, which he had wielded for 18 years, almost without a single constitutional check upon its absolute exercise.

Another of the great enterprises of this minister was the overthrow of the Huguenot party as a political power, and a rival of the throne in France. The siege and capture of Rochelle, which he conducted in person (1628), was followed by the submission of the other Huguenot strongholds. R., however, secured for the Huguenot body a certain measure of religious toleration; and, on the whole,

is confessed to have used his success in this conflict with moderation.

In the external relations of France, the great object of all his measures was the overthrow of the preponderance of Austria. With this view he did not hesitate to foment the internal disaffections of Germany, even allying himself with this design with the German Protestants, and even with the great champion of the Protestant cause, Gustavus of Sweden; and in connection with his anti-Austrian policy, he also took part with the disaffected Spanish provinces in the Netherlands. His designs on Belgium, however, failed of success. With similar views he lent his support to the revolt of Catalonia against Philip IV., and sent an army into Piedmont; nor is there any part of his foreign policy to which he adhered with such pertinacity to the very end of his life.

His internal administration of France has been severely criticised. He was reckless and unscrupulous in the use of means against his enemies, and the expenditure which his foreign wars entailed led to many and oppressive impositions. His own personal expenditure was magnificent even to prodigality, but he is acquitted of all sordid schemes of self-aggrandisement.

R. died at Paris, 4th December 1642. Notwithstanding his many distracting occupations, the writings which he left behind fill several volumes. Some of these, ascetical or controversial, were written before his entrance into political life. Of his later writings, his *Testament Politique* and his *Memoirs* have attracted much notice. He even indulged occasionally in literature, and wrote two plays of indifferent reputation. His letters are numerous, and many of them full of interest. He was a liberal patron of literature, and to him France owes the establishment of the Royal Printing Presses and the foundation of the French Academy.

RI'CHMOND, a market-town and parliamentary and municipal borough in the North Riding of Yorkshire, on the left bank of the Swale, 42 miles north-west of York. The parish church is chiefly in Gothic, but partly in Norman architecture; the grammar-school has an endowment of £270 a year, and attached to it are six scholarships. Though the trade of R. is now much less extensive than in earlier ages, iron and brass founding and tanning are carried on, and there are a paper and several corn mills. The borough returns two members to the House of Commons. Pop. of municipal borough in 1861, 4290.

The Earldom of Richmond was conferred by the Conqueror upon his kinsman, Alan Rufus, Count of Bretagne; but came into the possession of the crown when Henry, Earl of Richmond, succeeded Richard III. as Henry VII. The title of Duke of Richmond was afterwards conferred by Charles II. upon his son Charles Lennox, in whose family it still remains. The castle, surrounded by picturesque scenery, stands on a rock overlooking the river. In the vicinity are some ruins of a small monastery, founded in 1258.

RICHMOND, a small town of Surrey, 10 miles west-south-west of London by railway, stands partly on the summit and declivity of Richmond Hill, and partly on the level right bank of the Thames. The rich and beautiful scenery of the vicinity is seen with advantage from the terrace, which stretches along the brow of the hill. The parish church contains the tombs of Thomson the poet, and of Kean the tragedian. The banks of the Thames are studded with delightful villas, and around the town are numerous nurseries and kitchen gardens. Pop. (1861) 10,921, who derive their subsistence chiefly by providing for the wants of the immense numbers of visitors and pleasure-seekers who frequent the town, especially during summer.

R., which was formerly called Scheen or Sheen, received its present name from Henry VII., who named it after his own earldom. It was a royal residence in the time of Henry I., and since that time the sovereigns of England have frequently resided here, and here Edward III., Henry VII., and Elizabeth died. Richmond Park, 8 miles in circuit, is open to the public.

RICHMOND, the capital of Virginia, U. S. America, on the left bank of the James River, at the head of tide water, 150 miles from its mouth, lat. 37° 32′ 17″ N., long. 77° 27′ 28″ W., 100 miles south of Washington, picturesquely situated on the Richmond and Shockoe Hills, on the lower falls of the James River, and regularly laid out and built, and surrounded with beautiful scenery. The capitol is a stately building in the centre of a park of 8 acres, the grounds of which are ornamented with trees and statuary. There are also handsome state and county edifices, penitentiary, theatre, orphan asylum, 30 churches, 13 colleges, 6 daily and 9 weekly newspapers, 4 cotton and 50 tobacco factories, extensive flouring-mills, forges, furnaces, and machine shops. The exports, chiefly tobacco and flour, in 1859 were 6,682,258 dollars. Vessels drawing 10 feet can come within a mile of the centre of the city; those of 15 feet to three miles below. A canal round the falls gives a river navigation 200 miles further, and a canal and several railways connect it with the great network of southern railways. R. was founded in 1742. In 1811, the burning of a theatre destroyed the lives of 70 persons, including the governor of the state. In June 1861 it was selected as the Confederate capital, and from that period was the objective point of a series of formidable military expeditions for its capture, under Generals M'Dowell, M'Clellan, Burnside, Hooker, Meade, and Grant, and defended by General Lee with a large army and formidable lines of fortifications, until the seizure of the lines of supply by Generals Grant and Sheridan compelled its evacuation after a series of sanguinary battles, April 3, 1865. A considerable portion of the city was destroyed by the retreating Confederates. Pop. in 1860, 37,910; in 1870, 51,038.

RICHMOND, a city of Indiana, U. S., on the east fork of Whitewater River, 70 miles north-west of Cincinnati, and the focus of six railways. It was founded by a colony of Friends in 1816. The river gives water-power to factories of cotton, wool, flour, and several extensive implement factories, &c. R. has a brisk trade with a fertile and populous country. There are 15 churches and 5 newspapers. Pop. in 1860, 6603; in 1870, 9445.

RICHTER, Jean Paul Friedrich, better known as 'Jean Paul,' a German humorist and sentimentalist of the greatest singularity, hence called by his countrymen *Der Einzige* (The Unique), was born at Wunsiedel, in Bavaria, March 21, 1763. His father, who was a poor schoolmaster at the period of R.'s birth, subsequently became parish priest at Schwarzenbach, on the Saale; but his circumstances always remained straitened, and he died burdened with debt, while his son was attending the gymnasium at Hof. Nevertheless, R. went to the university of Leipzig in 1780 to study theology, which did not prevent him from roving freely over the whole circle of literature. The exact extent of his scholarly acquirements cannot well be ascertained; his studies were never systematic, and it is probable that he was not deeply read in any single branch of learning, but he carried in his head or in his note-books a vast

confused miscellany of facts, literary, scientific, philosophical, and theological, and strewed them with oriental profusion over the pages of his works, where they do duty as metaphors, or illustrations after the most grotesque and wonderful fashion. The English satirists, Pope, Swift, and Young, appear to have been special favourites with him; and among his own countrymen, Hamann and Hippel. But the most marvellous thing about his student-life was not the extent or variety of his reading, but the fact that he had the heart to read at all! During the whole time he was plunged in the most miserable poverty. He could hardly get a single private pupil, and passed many a day without tasting food. Hunger was, in truth, his constant companion. In desperation he betook himself to literature for a subsistence, but it was long before he won recognition. His first composition, *Das Lob der Dummheit* (The Praise of Folly), modelled on the *Moriæ Encomium* of Erasmus, could not find a publisher; his second, written, he tells us, while he was surrounded by 'unpaid debts and unsoled boots,' *Grönländische Processe* (Greenland Lawsuits, 2 vols., Berl. 1783—1785), did succeed in getting itself published but not read, and at length the heroic fortitude of R. gave way. In 1785, he fled from the city to avoid incarceration for debt, and took refuge with his mother at Hof. Here his circumstances were little better; and in 1786, he was glad to accept a tutorship at Topen in the family of Herr von Oerthel. In 1790, at the request of several families of Schwarzenbach, he removed thither to take charge of the education of their children, and lived in this way as a private schoolmaster for some years. Meanwhile, he had not given up authorship. In 1788, appeared at Gera his *Auswahl aus des Teufels Papieren* (Selection from the Devil's Papers), which, however, in spite of its captivating title, did not prove more popular than its predecessors. R. seemed destined to failure as a writer. His sarcastic, far-glancing, and grotesquely-sportful humours were so unlike anything else in literature, and so oddly, not to say extravagantly, expressed, that the mass of readers could make nothing of them at all, and perhaps charitably regarded the author as crazy. But in 1793 the turning-point in his fortunes and fame occurred. In that year, a work which he had published at Berlin, *Die Unsichtbare Loge* (The Invisible Lodge), and which was a sort of romance based on his experience as a schoolmaster, proved unexpectedly successful, and R. began to grow a little more familiar with the sight of gold. It was followed by *Hesperus* (4 vols., Berl. 1794), the work by which he is perhaps best known out of Germany; *Quintus Fixlein* (Baireuth, 1796); *Biographische Belustigungen unter der Gehirnschale einer Riesin* (Biographical Recreations under the Cranium of a Giantess, Berl. 1796); *Blumen-, Frucht-, und Dornenstücke* (Flower, Fruit, and Thorn Pieces, 4 vols., Berl. 1796—1797), the opening chapter of which contains his magnificent 'Dream of the Dead Christ,' translated into English by Carlyle; *Jubelsenior* (The Parson in Jubilee, 1797); and *Das Campanerthal* (Erfurt, 1798), a work on the immortality of the soul, which attracted the notice and won for its author the friendship of Herder. R. was now one of the greatest celebrities of Germany; his books had become quite the rage, especially among educated women. He himself, too, was personally a great favourite; there was something in his conversation and manner so winning, joyous, and charmingly tender, that it excited not only friendship but love. We read of one brilliant woman, Charlotte von Kalb, who actually sought to obtain a divorce in order that she might marry R.; and of another who committed suicide because he would not return her unlawful passion. This last incident affected R. profoundly. He was not only perfectly innocent in all his relations with the other sex, but pure and high-minded to a degree, and he had remonstrated with the unhappy maiden in the most wise and delicate manner. In 1801, after he had become famous, he married Caroline Mayer, daughter of Professor Mayer of Berlin, and with his young wife travelled about Germany a good deal, visited Goethe and Schiller, with neither of whom, however, he became intimate, and formed a closer acquaintance with old Gleim, Wieland, &c.; but ultimately settled at Baireuth, in Bavaria, where he devoted his time with the most honourable assiduity to work. His aërial, fantastic, many-hued creations—his solemn images of glory and gloom—his riant humours—his burlesque speculations on life, manners, and, indeed, on the *omne scibile*—his innumerable descriptions of nature, soft-glittering as with morning dew, flowed from him as from inexhaustible fountains. The productions belonging to his later period of a humorous kind are, *Titan* (4 vols., Berl. 1800—1803), considered by R. himself his greatest work; *Flegel Jahre* (happily rendered by Carlyle 'Wild Oats,' 4 vols., Tüb. 1804—1805); *Katzenberger's Badereise* (2 vols., Heidelb. 1809); *Des Feldpredigers Schmelzle Reise nach Flätz* (Tüb. 1809); and *Der Komet, oder Nikolaus Markgraf* (3 vols., Berl. 1820—1822). Among works of a professedly reflective or philosophical character (though the elements of humour and poetry are by no means absent), we may mention his *Vorschule der Aesthetik* (3 vols., Hamb. 1804), *Levana oder Erziehungslehre* (Brunswick, 1807), a treatise on education; and numerous other pieces. R. died November 14, 1825. In his latest years he was afflicted with a decay of his physical powers, and in his last year with total blindness. The death of his son Max, in 1821—a youth of great promise—inflicted an incurable wound on his heart.—See *Wahrheit aus Jean Paul's Leben* (Bresl. 1826—1833), a work begun by R. himself; Däring's *Leben und Characteristik Richter* (2 vols., Leip. 1830); Spazier's *Jean Paul Friedrich Richter ein Biographischer Commentar zu dessen Werken* (5 vols., Leip. 1833). Some of his pieces have been translated into English by Carlyle and others; Carlyle has also given us two admirable essays on the life, writings, and genius of the man, to which we refer our readers.

RI'CINUS. See CASTOR-OIL PLANT.

RI'CKETS, or RACHI'TIS (from the Gr. *rhachis*, the spine, because a peculiar form of spinal curvature results from the affection), is regarded by some writers as a special disease of the bones, and by others as merely one of the various forms of scrofula. Whichever view be correct, there can be no doubt that the general symptoms in rickets are closely allied to those in scrofula, and that the same general plan of treatment is equally useful in both affections. The characteristic symptom in rickets is the imperfect development, atrophy, softness, and consequent distortion of some or many of the bones. The bones thus affected consist of a sort of gelatinous tissue, which will bend without breaking; and they are so soft that they may be cut with a knife. On microscopico-chemical examination, the structural arrangement of the bone is found to be unaffected, while there is a great deficiency of the earthy salts to which the normal bones owe their firmness. While 100 parts of healthy bone contain about 32 per cent. of organic matter, and 68 per cent. of inorganic matter, or earthy salts, the proportions are altogether reversed in rickets. Thus

in this disease, Marchand found 79·4 per cent. of organic matter, and 20·6 of earthy salts in a femur; while Ragsky found 81·12 per cent. of organic matter, and only 18·88 of earthy salts in a humerus: thus shewing that these bones contained less than one-third of the normal quantity of earthy salts. The weight of the body acting on bones thus constructed causes them to bend, and the thighs or shins are abnormally arched, or the spine is curved, or, in slighter cases, only the normal form of the ankle is modified. In aggravated cases, the chest is so affected as to give rise to the condition known as *pigeon-breasted;* the lower jaw is imperfectly developed, and the teeth project; and the pelvis becomes so altered in form as to render future childbearing in the highest degree perilous. Rickets is exclusively a disease of childhood, and generally attacks the children of the poor.

The treatment must be mainly directed to the improvement of the general health. Free exposure to pure bracing air, sponging with sea-water, or sea-bathing if the little patient can bear it, an abundance of animal food, cod-liver oil, iron, and quinia, include all that need be said about general treatment. Dr Druitt recommends a jelly containing phosphate of lime (with the view of restoring to the bones the salt in which they are specially deficient). It is well worthy of further trial, and may be prepared as follows: Boil about four ounces of ivory-dust in water for ten minutes; then strain off the water, and throw it away with the impurities which it has taken up. Add more water, in which the dust should be stewed till the jelly is extracted, and the dust itself is soft enough to crush between the teeth. Lemon-juice, wine, sugar, or other flavouring ingredients, may be added; and the softened ivory-dust should be eaten with the jelly.

When a child with crooked legs is brought to a surgeon, he must carefully ascertain whether the crookedness depends on mere relaxation of the joints, or whether it lies in the bones themselves. In the former case, the child will probably grow up straight when his general health improves; whereas in the latter case (if the femur or tibia is absolutely bent), the surgeon must give a very guarded opinion.

RICKMAN, Thomas, a distinguished architect, was born at Maidenhead in 1776. He was unsettled in early life, and tried several employments both in London and Maidenhead. He managed his father's business of druggist for some time, and afterwards became a clerk in an insurance office. He seems to have always had a love for architecture, and to have studied it carefully. In 1808, he began to give his full attention to it, and wrote the classification of Gothic styles, which has rendered him famous. He first pointed out the features which distinguish the different periods of that style. He divided it into four periods, and called them Norman, Early English, Decorated, and Perpendicular (q. v.), and these names and the dates he assigned to them are still the most frequently used.

R. became after this an architect in Birmingham, and was employed to design a great many buildings, especially churches. He died in March 1841. His work is called *An Attempt to discriminate the Styles of Architecture in England from the Conquest to the Reformation.* It was first written for Smith's *Panorama of Science and Art*, and has passed through several editions; that by Parker of Oxford (1847) is the best.

RI'COCHET, in Artillery, is the bounding of a shot along the ground which takes place when a gun is fired low. Ricochet firing is found extremely useful both in its actual and moral effect in clearing the face of a ravelin, bastion, or other rather long line of fortification. If well directed, the ricochet shot bounding along will dismount guns, scatter the gunners, and greatly intimidate the garrison. Vauban first introduced ricochet firing at the siege of Philipsburg in 1688. The defence against this sort of attack consists in earthen traverses along the threatened line, or in a bonnet (see Fortification) at the point of parapet nearest the enemy. In the field, ricochet, where the shot or shell is made to bound forward at least ten times, produces most disastrous and demoralising effects on masses of cavalry and infantry, whom it hews down in long lines.

RIDDLE (Ger. *räthsel*), a paraphrastic presentation of an unmentioned subject, the design of which is to excite the reader or hearer to the discovery of the meaning hidden under a studied obscurity of expression. In the present day, the riddle is a mere *jeu d'esprit*—a sort of witty pastime for idle people; we only meet with it under the form of Conundrum (q. v.), but anciently—and its antiquity is very great—it held a far higher place, and was put to far more important uses, although in its inferior phase of conundrum it was likewise a part of the intellectual entertainment at Greek, and latterly at Roman banquets. Among the easterns, it naturally associated itself with their symbolical modes of thought, and was also, as it still is, abundantly employed for didactic purposes. The so-called Proverbs or sayings attributed to Solomon frequently assume the form of riddles. Josephus relates, on the authority of Dius, the Phœnician historian, and of Menander of Ephesus, that Hiram, king of Tyre, and Solomon had once a contest in riddles or dark sayings, in which Solomon first won a large sum of money from Hiram, but ultimately lost it to Abdemon, one of Hiram's subjects—a curious instance of philosophical gambling. Every reader of the Old Testament is familiar with the riddle which Samson proposed to the Philistines, and the 'enigmas' (as the Septuagint has it) that the Queen of Sheba proposed to Solomon, though it is perhaps doubtful if the latter were more than hard or difficult questions plainly put. The riddle is found in the Koran, and several books of riddles exist in Arabic and Persian. It would appear that they were also known to the ancient Egyptians, while among the Greeks they were allied in the earliest times with the *oracula*, or mystic utterances of the inspired priests, and were generally, as is the case with Samson's riddle, in verse; but in Greece they first came into vogue about the time of the 'Seven Wise Men,' one of whom, named Kleobulos, as also his daughter Kleobuline, was celebrated for the composition of metrical riddles (*griphoi*), some of which are still remembered. Even the greater poets did not refuse to introduce the riddle into their writings, or to devote whole poems to the subject—as, for example, the *Syrinx*, commonly ascribed to Theocritus. Homer, according to a statement in Plutarch, died of chagrin at not being able to solve a riddle; and the riddle of the Sphinx (see Œdipus) is probably the most celebrated in the whole circle of philosophical puzzles. Among the Romans, professional riddle-makers did not make their appearance till the latest period of Roman literature, the reason assigned for which is the superior gravity and earnestness of the Roman genius, which, it is said, did not easily find pleasure in such modes of intellectual activity. Appuleius wrote a *Liber Ludicrorum et Griphorum*, but it is no longer extant, and almost the only name we can fix upon is a certain Cælius Firmianus Symposius, whose riddles, comprising a hundred hexametrical triplets

are termed by Aldhelmus (8th c.), apparently with justice, *Carmina inepta*.

The riddle, but more perhaps as an amusement for the baronial hall on winter-nights, or for the monastic mess-room, than as a serious intellectual effort, was much cultivated during the middle ages. This character of lively or amusing puzzle it has ever since for the most part retained. Many specimens of what would now be termed 'riddle' or 'conundrum books' exist in French, English, and German collections of manuscripts, and were printed at an early period. One of these, entitled *Demands Joyous*, which may be rendered 'Amusing Questions,' was printed in English by Wynkin de Worde in 1511. Many of these 'joyous demands' are simply coarse jests; but others, again, illustrate the simple, child-like religious belief of medieval Christendom—e. g., Demand: 'What bare the best burden that ever was borne?' Response: 'The ass that carried our Lady when she fled with our Lord into Egypt.' Some are really fitted to excite risibility—e. g., Demand: 'What is that that never was and never will be?' Response: 'A mouse's nest in a cat's ear.'—'What is the worst bestowed charity that one can give?' 'Alms to a blind man; for he would be glad to *see* the person hanged that gave it to him.' The Reformation, at least in Protestant countries, checked, if it did not wholly stop, the merry pastime of riddle-making; but in the 17th c. it began to creep into favour again. Le Père Ménestrier, a learned Jesuit, wrote a grave treatise on the subject; and in France, riddles soon rivalled in popularity the madrigals and sonnets of the period. The Abbé Cotin was a famous fabricator of riddles, and published a *recueil* of his own and those of his contemporaries, preceded by a dissertation, in which he modestly dubbed himself *Le Père de l'Enigme* (The Father of the Riddle); but, as a French critic remarks, posterity has not recognised his paternity. In the 18th c., the taste for the manufacture of riddles continued to increase, and most of the brilliant French *littérateurs*, such as Boileau, Voltaire, and Rousseau, did a little in this line, until, finally, the *Mercure de France* became a fortnightly repository of riddles, the solution of which was sufficient to make a reputation in society. In Germany, Schiller gave a broader development to the riddle. In his hands, it once again became something grave and sibylline, and attained in expression a high degree of literary beauty and force. A good collection of the best riddles is to be found in Ohnesorgen's collection, entitled *Sphinx* (6 vols. Ber. 1833).

RIDGE, the upper angle of a roof, usually covered with lead or zinc, and sometimes with stone or tile. Ridges are often ornamented with a cresting or running design, and recently cast-iron has been much used for this purpose.

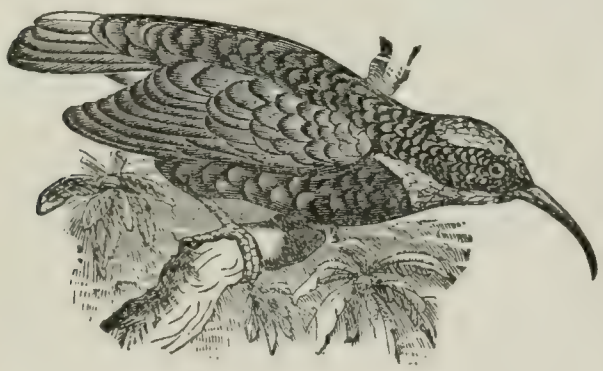
RI'DING (Saxon, *trithing*, third part), a term applied to three parts into which the county of York is divided, termed respectively East, West, and North Riding. A similar division existed in several other counties in the Anglo-Saxon period; there were the *laths* of Kent, the *rapes* of Sussex, the *parts* of Lincoln. The trithing, lath, or rape was formed of three or more hundreds, and presided over by a trithing-man or lath-grieve. In *Domesday Book*, we find Yorkshire divided, as at present, into three ridings, and subdivided into wapentakes. See WAPENTAKE.

RIDING-MASTER, an officer in the cavalry, military train, and artillery, whose duty it is to instruct the officers and men in the management of their horses. He is most commonly selected from the ranks; his pay is 9*s*. a day, rising by length of service to 10*s*. 6*d*. and 12*s*.; besides which, he receives £7 per troop per annum for riding-house expenses; and he is believed to make some profit out of this allowance. The riding-master has the relative rank of lieutenant, and, after an aggregate service of 30 years, including at least 15 years as riding-master, he has the right to retire on 10*s*. a day, with the honorary rank of captain.

RIDLEY, NICHOLAS, one of the most noted leaders of the Reformation in England in the 16th century, was a native of Northumberland, and born about the commencement of the century. He was educated at the foundation-school of Newcastle-upon-Tyne, and subsequently at Pembroke Hall, Cambridge. He became a Fellow of this college in 1524, and ultimately President. The spirit of the Reformation had already begun to penetrate the universities both of Oxford and Cambridge. Tyndale and Bilney had taught the new doctrines in the latter place; and Ridley, no less than Cranmer and Latimer, all Cambridge students about the same period, had probably caught something of their spirit. This reforming tendency was greatly strengthened by a tour on the continent of Europe, which he undertook on the completion of his studies. He encountered some of the most active Reformers abroad, and after a three years' absence, he returned, with his principles firmly grounded in favour of the new course of things. He became proctor to the university of Cambridge, and in this capacity protested against the claims of the papal see to supreme ecclesiastical jurisdiction in England. He was also chosen public orator, and, under the patronage of his friend Cranmer, advanced first to be one of the king's chaplains, and then, in 1547, nominated Bishop of Rochester. He distinguished himself by his vehement denunciations of the idolatrous use of images and of holy water, and very soon became one of the most prominent, as he remained one of the most consistent and inflexible supporters of the Reformed doctrines. He joined actively in the measures of Edward VI.'s reign, and on the deprivation of Bonner, Bishop of London, Ridley became his successor, three years subsequent to his elevation to the see of Rochester. In this high position he distinguished himself by his 'moderation, his learning, and his munificence.' He earnestly promoted the Reformation, yet without bigotry or intolerance; he exerted himself in the foundation of Christ's Hospital, and of the hospitals of St Bartholomew and St Thomas in Southwark, the two latter of which have become eminent as schools of medicine—the former as a school of classical and general instruction. He assisted Cranmer in the preparation of the 41 articles, afterwards reduced to 39. On the death of Edward VI., he warmly espoused the unfortunate cause of Lady Jane Grey; and on its speedy failure, and the accession of Mary, his known connection with it, as well as his general activity in the cause of the Reformation, exposed him to the vengeance of the papal party, again ascendant. He was committed to the Tower in 1553, and in the subsequent year, when a convocation was convened at Oxford for the discussion of the doctrine of transubstantiation, he was removed thither along with Cranmer and Latimer, in order that he might engage in the discussion. It was not to be expected, however, that any good would issue from such a step as this. The discussion proved a mere pretence; the Reformers were adjudged defeated and obstinate heretics, and condemned to suffer at the stake. On the 16th October 1555, R. was led forth to execution, along with his friend and fellow-reformer, Latimer. He suffered

in front of Baliol College, cheerful, steadfast, and consistently enduring as he had been throughout his life. He was, according to Burnet, one of the ablest of all who advanced the Reformation in England. His character is pure, elevated, and self-denying. Foxe says of him he was 'wise of counsel, deep of wit, benevolent in spirit.' His gentleness wins our sympathy, while his scholarly attainments and calm intrepidity excite our admiration.

RIENZI, Cola di, the famous Roman tribune, was born at Rome in 1313. His parentage was humble, his father being a tavern-keeper, named Lorenzo (by abbreviation, Rienzo), and his mother a washerwoman. Until his twentieth year, he lived among the peasants of Anagni; then he returned to his native city, where he studied grammer and rhetoric, read and re-read the Latin historians, philosophers, and poets (Greek was scarcely yet known in Italy), and excited his imagination, while at the same time he coloured his speech, with the prophetic enthusiasm of the inspired writers. The assassination of his brother by a Roman noble, whom he found it impossible to bring to punishment, is considered to be the incident that finally determined him to deliver the city, as soon as he was able, from the barbarous thraldom of the barons. He assumed the significant title of 'consul of orphans, widows, and the poor.' In 1343, he was appointed by the heads of the Guelph party spokesman or orator of a deputation sent to the papal court at Avignon to beseech Clement VI. to return to Rome in order to protect the citizens from the tyranny of their oppressors. Here he formed a close friendship with Petrarch, through whose assistance he obtained a favourable hearing from his Holiness, who appointed him notary to the City Chamber. In April 1344, R. returned home, and sought to obtain the countenance of the magistrates in his ideas of reform; but reform, he found, was impossible without revolution; yet he did not *conspire*, properly speaking, to the very last moment. During three years, he loudly and openly—perhaps even ostentatiously—menaced the nobles, for the enthusiasm of R. for a nobler and juster government, though sincere, was showy and vain. The reason why the nobles took no steps to crush him was because they thought him mad. At last, when R. thought he could rely on the support of the citizens, he summoned them together on the 20th of May 1347, and surrounded by 100 horsemen and the papal legate, he delivered a magnificent discourse, and proposed a series of laws for the better government of the community, which he termed *il buono stato*, and which were unanimously approved of. The aristocratic senators were driven out of the city, and R. was invested with dictatorial power. He took the title of 'tribune of liberty, peace, and justice,' and chose the papal legate for his colleague, but reserved to himself the direction of affairs, after having, however, suggested the institution of a syndicate, to which he should be responsible. The pope confirmed the eloquent dictator in his authority; all Italy rejoiced in his success, and foreign lands, even warlike France (according to Petrarch), began to dread the reviving majesty of the Eternal City. A bright dream now seems to have flashed across R.'s imagination—the unity of Italy and the supremacy of Rome! Every great Italian has dreamed that dream from Dante to Mazzini. R. despatched messengers to the various Italian states, requesting them to send deputies to Rome to consult for the general interests of the Peninsula, and to devise measures for its unification. These messengers were everywhere received with enthusiasm, and on the 1st of August 1347, two hundred deputies assembled in the Lateran Church, where R. declared that the choice of an emperor of the Holy Roman Empire belonged to the Roman people, and summoned Ludvig of Bavaria and Karl of Bohemia, who were then disputants for the dignity, to compeer before him. The step was wildly impolitic. R. had no *material* power to enable him to give efficacy to his splendid assumption. The pope was indignant at the transference of authority from himself to his subjects; and the barons, taking advantage of certain ceremonial extravagances which the dictator had committed, and which had diminished the popular regard for him, gathered together their forces, and renewed their devastations. After some ineffectual resistance, R. resigned his functions, weeping all the while, and withdrew from Rome, which was entered by the barons two days after. His tenure of power had lasted only seven months. In the solitudes of the Neapolitan Apennines, where he found refuge, R. would seem to have recovered his enthusiasm and his faith. Regarding his fall as a just chastisement of God for his love of worldly vanities, he joined an order of Franciscan hermits, and spent nearly two years in exercises of piety and penitence—all the while, however, cherishing the hope that he would one day 'deliver' Rome again. This ambition to play a distinguished part made him readily listen to a brother-monk, who, about the middle of 1350, declared that, according to the prophecies of Joachim of Flores, of Cyrillus, and of Merlin, R. was destined, by the help of the emperor Karl IV., to introduce a new era of happiness into the world. R. betook himself at once to Prague, and announced to the emperor that in a year and a half a new hierarchy would be established in the Church, and under a new pope, Karl would reign in the West, and R. in the East. Karl, not knowing very well what to say in reply to such language, thought it safest to put the 'prophet' in prison, and then wrote to inform his friend the pope of the matter. In July 1351, R. was transferred to Avignon, where proceedings were opened against him in reference to his exercise of tribunitial power. He was condemned to death, but his life was spared at the earnest entreaties of Petrarch and others; and the next two years were spent in an easy confinement in the French papal city. Meanwhile the state of matters at Rome had become worse than ever. The great families were even more factious, more anarchical, more desperately fond of spilling blood than formerly; and at last Innocent VI. sent Cardinal Athornoz to re-establish order. R. was also released from prison, and accompanied the cardinal. A residence was assigned him at Perugia; but in August 1354, having borrowed money, and raised a small body of soldiers, he made a sort of triumphal entry into Rome, and was received with universal acclamations. But misfortune had impaired and debased his character; he abandoned himself to good living, and his once generous sentiments had given place to a hard, mistrustful, and cruel disposition. The barons refused to recognise his government, and fortified themselves in their castles. The war against them necessitated the contraction of heavy expenses; the people grumbled; R. only grew more severe and capricious in his exactions and punishments. In two months his rule had become intolerable, and on the 8th of October, an infuriated crowd surrounded him in the Capitol, and put him to death with ferocious indignities.



RIE'SENGEBIRGE (giant mountains), a mountain range about 23 miles long by about 12 miles broad, between Bohemia and Prussian Silesia. See Bohemia.

RIE'TI (ancient, *Reate*), a city of Central Italy,

in the province of Perugia in Umbria, is situated at the foot of a hill, on the banks of the Velino, 45 miles north-east of Rome. It is walled, its streets are regular, and it has a fine cathedral, and many benevolent institutions. It is the seat of an archbishop. R. was a noted city of the Sabines. Pop. 14,224.

RIFF, The, a portion of the coast of Morocco which extends from Tangier on the west to near the western frontier of Algiers, having a length of about 210 miles, with a breadth of 58. The name, in the Berber language, which is that of the inhabitants, signifies a mountainous and rugged coast. The Riff mountains, which stretch along near and parallel to the coast, are green and wooded, and are here and there intersected transversely by fertile valleys or deep ravines, each of them possessing its brook or rivulet, which descends to the Mediterranean. The R. region is separated from the parallel mountain chain south of it by an extensive, fertile, and well-watered plain, in which stands the city of Fez. The inhabitants of the R. are almost wholly Berbers, who are employed in feeding and breeding cattle, fishing, and occasional piracy. On account of the injuries inflicted by them on merchant vessels, most of the maritime states of Europe agreed to pay an annual sum as quit-money. However, in 1828, Austria declined further payment of the tax. A Venetian vessel was seized by the pirates, in the harbour of Rabat, but the arrival of an Austrian fleet off the port produced restitution of the ship and its cargo, as well as the formal renunciation of all further claims. France followed the same course by declaring war against the Sultan of Morocco, and obtained compensation, in 1844, since which period piracy has much diminished. Its example was followed by the Spaniards in 1859. The sultan, however, had always discountenanced piracy, but his authority in the R. was too weak to compel obedience.

RIFLE-BIRD (*Ptiloris Paradiseus*), a bird of the family *Upupidæ*, with a long curved bill, and in size about equal to a large pigeon. It inhabits the south-eastern districts of Australia, and is found only in very thick 'bush.' The male is regarded as more splendid in plumage than any

Rifle-Bird (*Ptiloris Paradiseus*).

other Australian bird. The upper parts are velvety black, tinged with purple; the under parts velvety black, diversified with olive-green. The crown of the head and the throat are covered with innumerable little specks of emerald green, of most brilliant lustre. The tail is black, the two central feathers rich metallic green.

RIFLED ARMS were invented for the purpose of remedying certain defects essentially connected with cylindrical smooth-bore guns. These defects, which are chiefly owing to atmospheric resistance, shewed themselves in the erratic motion of the ball, especially when fired at a long range, and arose from the following causes: *First*, The ball never fitted tightly, and, in consequence of this, its centre was below the centre of the bore. A portion of the explosive force of the powder escaped over the top of the bullet, and was not only wasted, but exercised a downward pressure on the ball, tending to squeeze it *into* the under side of the barrel, and so great was this pressure, that in guns of soft metal, as brass, a perceptible dint was produced after a few rounds. Another and more important consequence of the looseness of the ball was, that the action of the powder on it was necessarily irregular, and its resulting motion along the barrel was a series of oblique impacts, now against one side, now against the other, and the direction of its motion after expulsion was necessarily not in line with the axis of the barrel, and depended upon the side of the barrel with which it was last in contact. *Secondly*, Balls can never be perfectly homogeneous, and the violent and sudden pressure of the exploded powder produces a slight change of shape; consequently, the centre of gravity can never accurately coincide with the centre of the sphere, the air resists its forward motion unequally, and true flight is precluded. *Thirdly*, As a consequence of the friction of the ball against the sides of the barrel, it acquires a rotatory motion, the direction of its rotation after expulsion being determined by the particular point of the muzzle with which it was last in contact. Thus, if it finally touched the top or bottom of the muzzle, the plane of rotation of the anterior surface of the ball would be in line with its progressive motion, and the rotation would be in an upward or downward direction; if it last rebounded from the right side, the plane of rotation would be in line with its path, and the rotation of the anterior surface from left to right, and so on. The ball, in its rapid flight, compresses the air in front, and produces a vacuum behind; the denser, because more compressed, air in front, attempts to rush round the sides of the ball to fill up the vacuum. Now (see fig. 1), let us suppose that the ball, while in rapid advance, is also revolving in a horizontal plane, and from left to right, the side A, whose rotation *conspires with* the motion of translation, resists, by its friction, the attempt of the air to reach the vacuum by that side; while the side B, whose rotation is against the motion of translation, conspires to aid the air in reaching the vacuum. It follows from this, that the air is denser in front of A than in front of B; its resistance on the side A is greater than that on B, and the ball, in consequence, is deflected towards the side on which the resistance is least (towards the right in this instance). If the ball struck the top of the muzzle, its revolution would be in a vertical plane in line with the barrel, and in an upward direction, under which circumstances the ball would tend, first, downwards from the first reason, and then upwards from the third; while, if it struck the bottom of the muzzle, the contrary would be the case. These aberrations of the ball from its true theoretical path, as was evident to artillerists, could never be wholly annihilated while smooth-bores

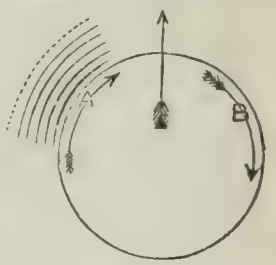


Fig. 1.

were used, and they set themselves to discover how they might be counteracted. It occurred to them that this could best be managed by securing that the plane of rotation of the ball should be at right angles to its motion of translation, as the irregularities in its structure, which produce aberrations of the first and second kind, would thus act equally in all directions, producing an exact counterbalance, while the aberration from the ball's rotation would wholly disappear; and the constancy of the vertical transverse position of the plane of the ball's rotation was obtained by making one or more spiral grooves along the interior of the barrel.

As early as 1498, the citizens of Leipzig possessed the germ of the future rifle, for their arms had a grooved bore, but the grooves were straight. Not many years after, in 1520, Augustin Kutter (or Koster) of Nürnberg was celebrated for his rose or star-grooved barrels, in which the grooves had a spiral form. It took its name from the rose-like shape of the bore at the muzzle; and, setting aside superiority of workmanship subsequently developed, Kutter's arm was the veritable rifle, and to him, therefore, so far as history shews, is due the invention of this terrible weapon, which reduces the flight of the projectile to a question of the individual skill of the marksman. The spiral groove gives to the bullet, if it fits into the grooves, a rotation rapid in proportion to the force of the explosion and the sharpness of the twist in the spiral. This revolution of the bullet on its own axis keeps that axis, gravity excepted, in the line in which it leaves the piece. In 1628, Arnold Rotsiphen patented a new way of 'makeing gonnes,' which, from a subsequent patent granted him in 1635, appears to have consisted, among other improvements, in rifling the barrels. It would be tedious to enumerate the various principles of rifling which were tried during the two centuries following Rotsiphen—suffice it to say, that scarcely a form of rifling now prevails but had its prototype among the old inventions. The difficulty of mechanical appliances making the rifling true, deferred, however, their general introduction, and the cost of rifled arms limited their use to the purposes of the chase. The revolutionary government of France had rifles issued to portions of their troops, but they met with so indifferent a success that Napoleon recalled them soon after he came to power. In the Peninsula, however, picked companies of sharpshooters practised with rifles with deadly effect on both the English and French sides. During the American war, 1812—1814, the Americans demonstrated incontestably the value of rifles in warfare; but many years were yet to elapse before they were definitively placed in the hands of soldiers, many of those of every nation in the Crimea having fought with the ineffective and almost ridiculous 'Brown Bess.' Soon after the French invaded Algeria, they had armed the Chasseurs d'Orleans with rifles, to counteract the superior range of the Arab guns. The inutility of the old musket was shewn in a battle during the Kaffir war, where our men discharged 80,000 cartridges, and the loss of the enemy was 25 men struck. After experiments with the old musket, it was found that its aim had no certainty whatever beyond 100 yards. It was soon discovered that a spherical ball was not the best missile; one in which the longer axis coincided with the axis of the gun flying truer—the relative length of the axis and the shape of the head being matters of dispute. The first war-rifle was that of Captain Delvigne, proposed in 1826, and adopted for a few men in the French army; but this still included the old and rude plan of forcing the leaden ball through the grooves by blows of the ramrod, it being of course requisite that the projectile should occupy the grooves tightly. In 1842 Colonel Thouvenin invented a *carabine à tige*, in which the breech had a small pillar screwed into it, round which the powder lay, and on the end of which the bullet rested, its base being flattened out by the force of the ramrod. Colonel Delvigne added a conical bullet to this rifle, and the combined invention was issued to the Chasseurs d'Afrique in 1846. But the *tige*, or pillar, became bent by usage, and was found otherwise objectionable. It was superseded by using with a grooved barrel the Minié bullet, which, being made smaller than the bore of the piece, could be almost dropped into the barrel. It was of lead, and in its base it contained a conical recess, to receive the apex of a smaller iron cup (A). The force of the explosion drove this cup into the bullet, causing the lead to expand into the grooves of the barrel. (It is right, however, to state that this contrivance is claimed for a Mr Greener as early as 1836.) The Prussians, meanwhile, had armed their troops with the needle-rifle (*Zündnadelgewehr*), which is still in use. In England, however, no improvement took place until 1851, when 28,000 rifled muskets to fire the Minié bullet were ordered to be issued. Notwithstanding the many advantages of the Minié system, it was found defective in practice. The rifle fouled quickly, and sometimes the iron cup went beyond expanding the lead, by being driven completely through it, leaving the bullet a mere distorted tube, which sometimes remained firmly fixed in the barrel.

Fig. 2.—Minié Bullet.

Experiments were set on foot in all directions, and resulted in 1853 in the production of the Enfield rifle, which had three grooves, taking one complete turn in 78 inches, and fired a bullet resembling the Minié, except that a wooden cup was substituted for one of iron. This rifle is stronger than its predecessor, while its weight with 60 cartridges is 3 lbs. less, a matter of no small moment to the soldier. Its diameter is ·577 of an inch, its bullet weighs 530 grains, and ranges with great accuracy for 800 yards, and fairly up to 1100. Since 1853, this has been the weapon of the British army; and although beaten in execution by the Whitworth, Lancaster, and some other rifles, it is incontestably the best for precision of fire with which any army has to this time been equipped; but its system of rifling is only the system long in use. The vast manufactory at Enfield (see SMALL ARMS FACTORY) enables many thousand rifles to be turned out annually, so exactly made in all their parts as to be absolutely interchangeable. As, however, the results were not entirely satisfactory, government confided to Mr Whitworth, a very celebrated mechanician, the task of arriving, by inductive reasoning, at the best form of rifling. After protracted and most careful experiments, he concluded to dispense entirely with the old grooves and lands, and substituting for this a polygonal bore, with a twist towards the muzzle. He selected the hexagon as the most suitable polygon, and reduced the bore to ·451; used a projectile fitting mechanically to the bore; took one turn for his spiral in 20 inches; and, as a result, reduced the height of the trajectory to 8½ feet

Fig. 3.—Section of the Enfield Rifle.
a, groove; *b*, land.

instead of 11 in the Enfield, while he obtained a steady and accurate flight of 2000 yards and upwards. Mr Lancaster, by other reasoning, had previously abandoned grooves for a uniform elliptical bore with a spiral (see LANCASTER RIFLE).

Various other systems have from time to time been proposed by Mr Westley Richards, Mr Terry, and other eminent gunmakers; but the Enfield grooves, the Whitworth polygon, and the Lancaster ellipse, will probably remain the representative guns of the different classes, and between them the ultimate victory will probably lie.

As with small-arms, so with cannon, rifling is no new discovery. In the Museum at St Petersburg is a cannon which was rifled in nine grooves as early as 1615. In 1661, the Prussians experimented with a gun rifled in 13 shallow grooves. By 1696, the Germans had tried elliptical bores. From thence till 1833, many attempts were made to rifle cannon, with more or less success; but although the firing of smooth-bore guns was as aberrant as that of smooth-bore muskets, and from greater range even more so, yet, since the gunners were safe from musketry-fire at 200 yards, and the cannon could be directed against masses of men with tolerable certainty up to 600, there was no special inducement to improve their powers. But the introduction of rifled small-arms changed the relative advantages; for an Enfield rifle might pick off the gunners of a smooth-bore cannon before their weapon could come into effective play. The Crimean war set inventors vigorously at work, and many admirable guns have resulted from their attempts, the great difficulty of the day being to decide which is most effectual. The first point was the metal; and here cast-iron was found quite useless, being incapable of resisting the explosion of the large charges necessary to force closely fitting projectiles through rifled barrels. Several plans were resorted to. Sir William Armstrong welds coils of wrought-iron round a mandrel into one homogeneous mass of extraordinary tenacity, which he again strengthens by similar rings round the breech. Mr Whitworth forces rings of wrought-iron over the barrel by hydraulic pressure: Captain Blakely strengthens a barrel of longitudinal bars welded together by shrinking wrought-iron bands over it. The French rifle brass guns and use small charges; having also guns of wrought-iron. The Austrians have made a new bronze alloy, which has proved extremely strong; the Belgians have tried Bessemer's steel. The system of rifling was the next important matter. Mr Lancaster adhered to his oval bore; Sir William Armstrong produced a bore rifled in a great number of small sharp grooves (this gun was adopted by the British government); Mr Whitworth retained a hexagonal bore; and the French government adopted a bore with two, and subsequently three rather deep spiral grooves. After careful experiments, the Austrian, Spanish, Dutch, and Italian governments have concurred in the French system. These several bores are shewn below in section. In the Armstrong, the rotation is communicated to the projectile by the latter being cased with lead, which the explosion forces into the grooves. The numerous fine grooves impart a very correct centering to the shot, and give extreme accuracy of range; but they render the gun a delicate weapon, and they preclude the occasional firing of round shot or canister, which would destroy the grooves. In the Whitworth, the shot is constructed to pass freely through the spiral hexagonal bore, windage being prevented by a greased wad, which is said to foul the piece considerably. Lancaster's shot are elliptical, to correspond with the bore; they are simple and accurate; but there is some danger that they will jam in the gun, and cause it to burst. The French projectiles have ribs of projecting metal to correspond to the grooves, and are very effective, the system having the

Fig. 4.
(The Ellipse of the bore in the Lancaster is exaggerated to shew the principle.)

concomitant advantage of being able to fire ordinary shot without material injury to the gun. To sum up: the Armstrong gun is the most accurate, that and the Whitworth have the longest range, each having attained 5½ miles; the Lancaster fouls least; the French is simplest, and can fire ordinary cannon-balls, canister, or case.

Although the Armstrong gun was officially adopted into the British service in 1859, as the best weapon then known, competitive trials to determine the merits of the Armstrong and Whitworth guns were conducted for 2 years and 7 months, 1863—65, at a cost of £33,500. In 1864 Mr Mackay of Liverpool produced a gun on quite a new principle, called his 'windage-gun,' the effects of which, as regards range, precision, and penetration, have been very remarkable. His bore is rifled with small grooves, but the projectile, which does not fit into the grooves, has a rapid revolution imparted to it by the rush of gas through the grooves, and therefore around its circumference during the explosion. M. Krupp of Essen has demonstrated the practicability of making guns of steel capable of throwing solid steel shot weighing 1212 pounds. His famous gun, exhibited at Paris in 1867, weighed 112,000 pounds, and cost over $100,000. During the Franco-Prussian war not a single Prussian field-gun was broken. Some Krupp guns fired 300 rounds a day, scoring actually 8000 rounds, and steel guns have carried the palm over bronze.

The American war of rebellion stimulated the invention of American artists in efforts to produce the most efficient forms of rifled guns, and the *Spencer* repeating rifle, the *Snider*, *Peabody*, *Remington*, *Berdan*, *Hammond*, *Sharp*, and others have been brought forward at the competitive trials in England and Austria, &c., where generally the guns of the best English makers have not only been beaten by outsiders, but by almost all the American guns exhibited.

Rodman and Parrot guns of American invention were employed during the war of rebellion; the former was chilled within by a stream of water, while the outer surface was being subjected to a very slow process of cooling in a moderate furnace.

In 1867 the Snider system was selected by the British War Department, and the Enfield gun was then under process of conversion into the Snider-Enfield at the rate of 1100 per day. The *Needle-gun* (q. v.) appears to have been originally patented in England as a muzzle-loader in 1831, by Mr Moser of Kennington, but, being coldly received in England, he found appreciation in Prussia. This gun is to be remodelled after the *Chasse-*

pot, which is its superior. See Norton and Valentine's *Munitions of War at Paris Exhib.*, 1867, vol. v., Washington, 1868; *Annual of Scientific Discovery for* 1871; BREECH-LOADING ARMS, in SUPPLEMENT, Vol. X.

RI'GA, a most important seaport of Russia, capital of Livonia, and the centre of administration for the three Baltic Provinces, stands mainly on the right bank of the Dwina, 5 miles from the mouth of that river, in the Gulf of Riga. It is 376 miles south-west of St Petersburg, and is the terminus of a railway to Moscow, completed as far as Dünaburg. From the steeple of St Peter's Church, said to be the highest in the empire, a full view of the situation of the city is obtained. R. contains a number of striking and handsome public buildings, of which the castle, or Dom, built in 1204, now the residence of the governor-general of the three Baltic Provinces, is the chief. The Dwina is crossed by a bridge of boats, 800 paces long, of which the boats in the middle are movable, to allow of the passage of vessels, and which is entirely removed in winter. The old town is dark and gloomy, and shews all the main features of a German town of the middle ages; but the extensive suburbs are modern and handsome, and the whole is defended by ramparts, bastions, and other fortified works. R. is the second trading town in Russia. It contains numerous soap, candle, glass, and iron works; cloth, leather, sugar, and tobacco factories, and rope-walks. Shipbuilding is extensively carried on in the town and vicinity. The principal articles of export are flax, hemp, linseed, corn, timber, tallow, and tobacco. In 1867, the exports amounted to $21,250,000; the chief items in 1865 were: flax, 56,460 tons; hemp, 24,060 tons; and linseed, 1,078,320 bushels. The imports in 1867 did not exceed $10,1 8,000, the principal articles being fish and salt. In 1863, the value of the export trade to Great Britain was $8,773,492, being considerably more than half the entire exports. The import trade from Great Britain, in 1863, valued $1,419,330, or a third of the whole imports. Of the 3506 vessels, of 570,170 tons, that entered and cleared the port in 1863, 726 vessels, of 148,690 tons, were British. Pop. in 1867, 102,043.

R. was founded in the beginning of the 13th c. by Albert Buckshoevden, Bishop of Livonia, and soon became a first-rate commercial town, and member of the Hanseatic League. The Teutonic Knights possessed it in the 16th century. In 1621, R. was taken by Gustavus Adolphus, and held under Swedish dominion till 1710, but was finally annexed to Russia in 1721.

RIGA, GULF OF, an inlet in the north-east of the Baltic Sea, washes the shores of the three Baltic Provinces, Courland, Livonia, and Esthonia. It is over 100 miles in length from north to south, and is about 70 miles in breadth. The islands of Oesel, Dagö, Mohn, and Worms stand in the entrance to it, and narrow the mouth of the gulf to a passage about 20 miles in width. The chief river which falls into the gulf is the Dwina. Sandbanks render navigation in some parts dangerous.

RIGGING, in a ship, is a combination of very numerous ropes to afford stability to the masts, and to lower and hoist the sails. Notwithstanding the complication which the cordage of a rigged ship presents at first sight to the eye, the arrangement is remarkably simple. In all substantial points, the rig of each mast is the same; to understand one is, consequently, to understand all. In the accompanying diagrams, the same notation is observed throughout, spars being shewn by capital letters; sails, by italic letters; *standing* rigging, by Roman numerals; and *running* rigging, by Arabic numerals. To avoid a confusing number of symbols and needless repetition, the corresponding ropes, &c., on each mast bear the same numbers, and in the key, the name of such rope *per se* is only given. To find the full title of a rope, it is necessary to prefix (unless it pertain to the bowsprit or gaff) the name of the mast (mizzen, main, or fore) to which it belongs. For example, the spars marked D are, counting from the left, called respectively mizzen-royal-mast, main-royal-mast, and fore-royal-mast; the standing-ropes marked IV., are the mizzen-stay, main-stay, and fore-stay; and the running-ropes bearing the figure 5, are mizzen-braces, main-braces, and fore-braces.

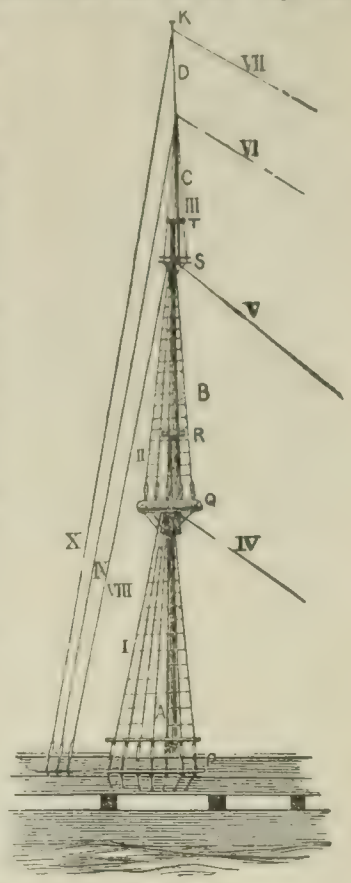

Fig. 1.

Rigging is either *Standing* or *Running*. The former is employed in maintaining, in fixed position, the masts and bowsprit; the latter runs freely through numerous blocks, and its functions are to raise and lower the upper masts and the yards, to trim the sails, to

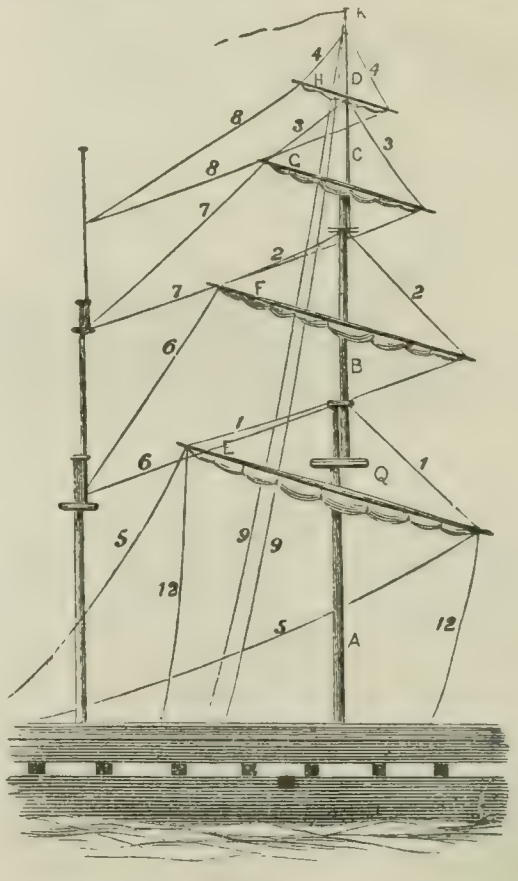

Fig. 2.

hoist the signals and other flags, and occasionally to furl the sails.

Each mast has the following standing rigging: at each side *shrouds* (I., II., III.), consisting of several very thick (usually plaited) ropes; in front, the *stays* (IV., V., VI., VII.); and behind, the *backstays* (VIII., IX., X.), coming down to the ship's sides behind the shrouds. Across the lowermast and topmast shrouds, thin ropes, called ratlings, are hitched horizontally, and form convenient ladders for the men to use in going aloft. The standing rigging of the lower mast reaches the chains on the ship's sides; while the shrouds of the topmast and topgallantmast are worked into the top, their stays to the tops of the masts nearer the bow in each case (the bowsprit serving as an anterior mast for the fore-rigging); all the backstays, however, are brought down to the ship's sides. In steamers, the mainstays require modification, in order to avoid the funnel; they are often adjusted on a plan similar to that of the backstays. The standing rigging of the bowsprit consists of the bobstays (XIV.), generally of chain; the martingale stays (XI., XII.), and martingale backstays (XIII.), which all exert an adverse pressure to that of the stays from the foremast, topmast, &c.

The *running* rigging is of four classes: 1. Lifts for the upper masts and the jib-boom. These are not shewn in the diagrams, from the fact that they run parallel, and closely contiguous to the masts, topmasts, and bowsprit.

2. The lifts for the yards and sails. Each yard has two lifts, one proceeding from a point near either extremity, and passing through a pulley at the head of that section of the mast to which the sail or yard belongs. They are worked either on the deck or in the top. The yard-lifts are shewn by the numbers 1, 2, 3, 4. The gaff and boom have separate lifts working into the mizzen-top (13, 15). Each jib-sail has a lift (not shewn), which acts parallel and close to IV., V., 10, or 11. If the ship carry stay-sails, there will be lifts parallel to the main and mizzen topmast stays and higher stays.

3. The ropes for adjusting the sails when spread. These comprise, first, the sheets for hauling down the lower corners of each sail—specimens are shewn

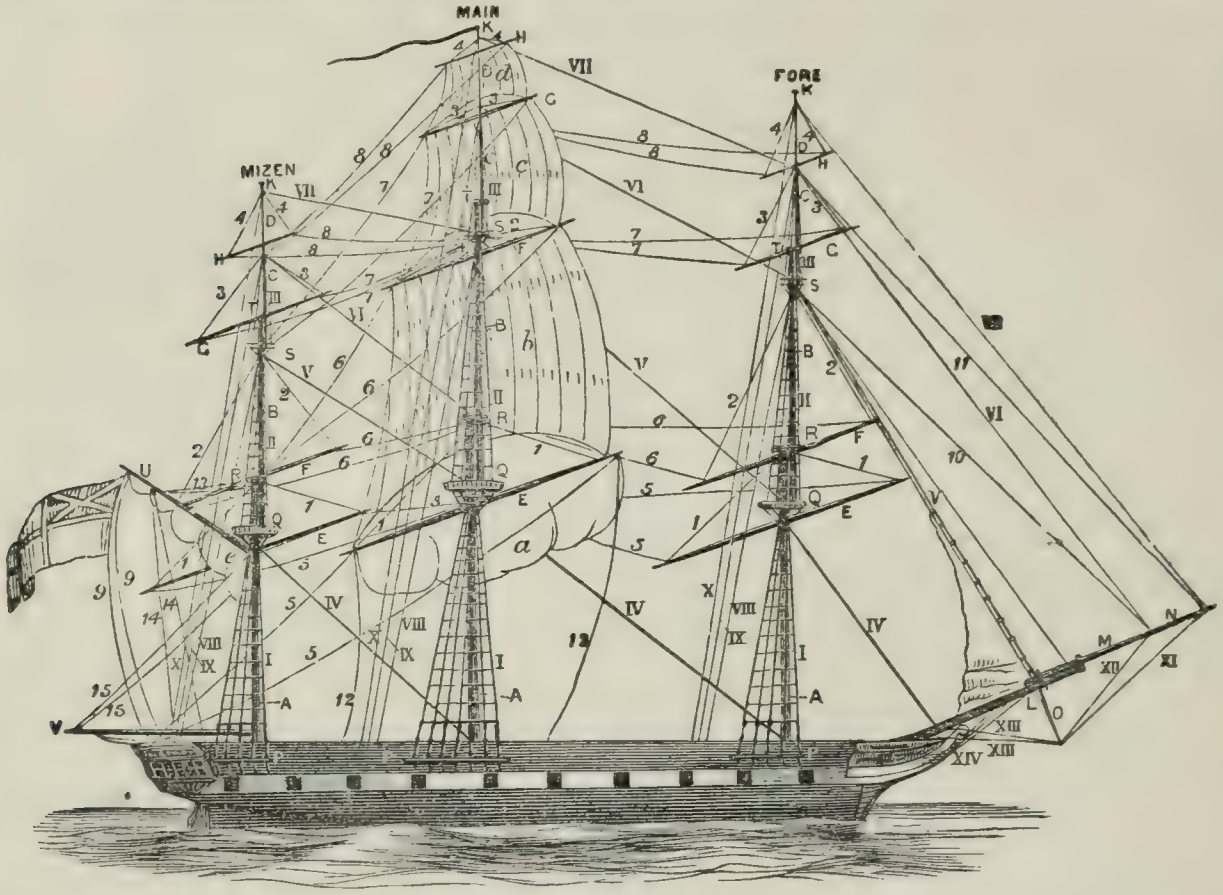

Fig. 3.

Spars, &c.—A, Mast; B, Topmast; C, Topgallantmast; D, Royal-mast; E, Yard; F, Topsailyard; G, Topgallantsail-yard; H, Royal-yard; K, Truck; L, Bowsprit; M, Jib-boom; N, Flying Jib-boom; O, Martingale; P, Chains; Q, Top; R, Cap; S, Crosstrees; T, Topmast Cap; U, Gaff; V, Boom, or Spanker-boom.

Sails. *a*, Mainsail; *b*, Topsail; *c*, Topgallantsail; *d*, Royal; *e*, Spanker.

Standing Rigging.—I. Shrouds; II. Topmast Shrouds, crossed by Ratlings; III. Topgallant Shrouds; IV. Stay; V. Topmast Stay; VI. Topgallantmast Stay; VII Royal Stay; VIII. Topmast Backstay; IX. Topgallantmast Backstay; X. Royal Backstay; XI. Flying Jib-boom Martingale Stays, XII. Jib-boom Martingale Stays; XIII. Martingale Backstays; XIV. Bobstays.

Running Rigging. 1, Lifts; 2, Topsail Lifts; 3, Topgallantsail Lifts; 4, Royal Lifts; 5, Braces; 6, Topsail Braces; 7, Topgallant Braces; 8, Royal Braces; 9, Signal Halyards; 10, Jib-stay; 11, Flying Jib-stay; 12, Sheet; 13, Peak Halyards; 14, Vangs; 15, Topping Lifts.

at 12; secondly, the braces for turning the yards about, to trim the sails to the wind. Each yard has two braces, one from either end passing to an adjoining mast, except the main braces, which are brought to the ship's side near the stern. The braces are shewn as Nos. 5, 6, 7, 8. The vangs and spanker sheet (14, 16) perform similar offices for the spanker. There are minor ropes in connection with the sails, for assisting in furling, reefing, spreading, &c.; but it would have rendered the diagram too complicated to have inserted them.

4. Ropes in connection with the flags. Each mast has at its head a *truck*, containing two or more small pulleys. Over each of these, a thin halyard is passed, and brought down double to the deck. On these, any required flag is rapidly bent and hoisted with great ease. There are two pair of similar halyards to the gaff-peak; and when the

ship is to be decorated on any festive occasion, similar halyards are affixed to the end of each yard-arm.

In different classes of ships, slight modifications occur in the rigging, to suit particular circumstances, but the main principles of rigging are as detailed above for all sizes of decked vessels. See SAILS.

RIGHI, a mountain of Switzerland, in the canton of Schwyz, between Lakes Lucerne, Zug, and Lowerz, is isolated, and commands extensive views of some of the finest Swiss scenery. It is easily accessible; mule-paths and a railroad lead to its summit, which, though it forms an admirable natural observatory in favourable weather, is only 5676 feet above the sea. Verdant pastures clothe the entire summit, and the slopes are belted with forests. Crowds of tourists, of both sexes, ascend the R. every season, in order to enjoy the fine views (especially that of sunrise), which, in clear weather, it commands. There is a large hotel at the top, where tourists pass the night, in order to see the sunrise.

RIGHT, in Legal language, is that kind of interest or connection with a subject-matter which serves as a foundation for an action or suit, or other protection of a court of law or equity; and hence it means an interest that can be enforced, for if it is such as a court of law or equity cannot take notice of, it may be called a natural or moral, but it is not a legal right. Strictly speaking, right merely means a relation between external nature and some person or other, and therefore there is no such thing as abstract rights, for a right is only intelligible when predicated of some person who can exercise or enforce it. There is an old practical division of all rights into rights of the person and rights of things. In the former class are included such divisions as rights of personal security and liberty; rights connected with marriage, infancy, &c.; while in the latter class are included the general rights arising out of the possession of real and personal property. There are various subjects which do not fall under either division exclusively; indeed, none of the usual divisions of rights can be said to be more than vaguely descriptive of their subjects. It might naturally be expected that the correlative legal expression for rights should be wrongs, but this is not the case, the word wrong being used technically to mean only that class of infringements of one's rights which are connected with the person or the personal use of property. Thus, the refusing or withholding payment of a debt is not correctly called a legal wrong; but an assault or injury to one's person, or to one's property, irrespective of any contract, is properly called a wrong or a tort. The word right is also used, more or less technically, in a narrower sense. An action, called a writ of right, had for its object to establish the title to real property; but it was abolished, the same object being secured by the order of ejectment. A *petition of right* is a proceeding resembling an action by which a subject vindicates his rights against the crown, and recovers debts and claims, the first step being a petition, which is allowed by the home secretary, and referred for trial to a court of law. A *right of way*, is a right of a private owner or occupier to a way over the land of an adjoining proprietor, as incidental to his possession of a house, or premises, or land. *Right of action*, means simply a right to commence an action in one of the courts of law to recover damages or property. *Right of common*, means a right of one, who is not the owner or occupier of waste land, to send cattle to graze upon it, or to cut turf, or exercise some partial right of property over it. *Right of entry* is a right to possess and use lands or premises, &c.

RIGHTS, DECLARATION AND BILL OF. The convention which called the Prince and Princess of Orange to the throne of England, set forth, in a solemn instrument known by the name of the *Declaration of Rights*, those fundamental principles of the constitution which were to be imposed on William and Mary on their acceptance of the crown. This declaration, drawn up by a committee of the Commons, of which Mr (afterwards Lord) Somers was chairman, and assented to by the Lords, began by declaring that King James II. had committed certain acts contrary to the laws of the realm. The king, by whose authority these unlawful acts had been done, had abdicated the throne; and the Prince of Orange having invited the estates of the realm to meet and deliberate on the security of religion, law, and freedom, the Lords and Commons had resolved to declare and assert the ancient rights and liberties of England. It was therefore declared, that the power of suspending and of dispensing with laws by regal authority is illegal; that the commission for creating the late Court of Commissioners for Ecclesiastical Causes, and all commissions and courts of the like nature, are illegal; that the levying of money for the use of the crown by prerogative, without grant of parliament, is illegal; that it is the right of the subjects to petition the king, and all prosecutions for such petitioning are illegal; that the raising or keeping of a standing army in time of peace, except with consent of parliament, is illegal; that Protestant subjects may have arms for their defence; that the election of members of parliament should be free; that freedom of speech in parliament should not be questioned in any place out of parliament; that excessive bail ought not to be required, or excessive fines imposed, or cruel or unusual punishments inflicted; that jurors should be duly impanelled, and that jurors in trials for high treason should be freeholders; that grants and promises of fines and forfeitures before conviction are illegal; and that for redress of all grievances, and the amendment, strengthening, and preserving of the laws, parliaments ought to be held frequently. All these things the Lords and Commons claimed as their undoubted rights and liberties; and having done so, they resolved that William and Mary should be king and queen of England for their joint and separate lives, the administration being during their joint lives in William alone; and that on their decease the crown should descend to the issue of the queen, then to that of Anne and her posterity, and, failing them, to the issue of William.

This Declaration of Rights was presented to the Prince and Princess of Orange at Whitehall, and accepted by them along with the crown. Being originally a revolutionary instrument, drawn up in an irregular assembly, it was considered necessary that it should be turned into law. The Declaration of Rights was therefore brought forward in the parliament, into which the convention had been turned, as a Bill of Rights, and passed the Commons; but an amendment proposed in the Lords regarding the settlement of the crown on the issue of the Princess Sophia, in the event of Mary, Anne, and William all dying without issue, led to several ineffectual conferences between the two Houses, which ended in the measure being dropped. The bill was, however, reintroduced in the following session of parliament (1689) without the proposed amendment, when it passed both Houses, and obtained the royal assent—a clause, however, being added, which originated in the House of Lords, to the effect that the kings and queens of England should be obliged

on coming to the throne, in full parliament or at the coronation, to repeat and subscribe the declaration against transubstantiation, and that a king or queen who should marry a papist would be incapable of reigning in England, and his subjects would be absolved from their allegiance.

RIGHTS OF MAN, a famous statement of rights, principally drawn up by Dumont, author of the *Souvenirs de Mirabeau*, and solemnly adopted by the French National Assembly on the 18th August 1789. It declares that all mankind are originally equal; that the ends of the social union are liberty, property, security, and resistance to oppression; that sovereignty resides in the nation, and that all power emanates from it; that freedom consists in doing everything which does not injure another; that law is the expression of the general will; that public burdens should be borne by all the members of the state in proportion to their fortunes; that the elective franchise should be extended to all; and that the exercise of natural rights has no other limit than their interference with the rights of others. Mirabeau endeavoured in vain to induce the Assembly to postpone publishing any declaration of rights until after the formation of the constitution; but the deputies, feeling that a contrary course might imperil their popularity, issued the declaration—a proceeding which Dumont himself afterwards compared to placing a powder-magazine under a building, which the first spark of fire would blow into the air. Louis XVI., under the pressure of the events of the 5th of October, after first refusing, was induced to yield his adhesion to it. The dogma of the equality of mankind on which the declaration rests, had before been set forth in the American Declaration of Independence of 1776. Thinkers are now much less inclined than they were in the age of Rousseau to build social theories on such abstract, *a priori* assumptions; and the truth of this doctrine of original equality is directly impugned. Dumont himself asks: 'Are all men equal? Where is the equality? Is it in virtue, talents, fortune, industry, situation? Are they free by nature? So far from it, they are born in a state of complete dependence on others, from which they are long of being emancipated.'

The principles laid down in the *Rights of Man* were attacked by Edmund Burke in his *Reflections on the French Revolution*, who represented the declaration as a digest of anarchy. It was in reply to Burke's *Reflections* that Thomas Paine published in London his *Rights of Man*, an apology for, and commentary on, the principles of the French constitution, for which he was prosecuted for libel on an information by the attorney-general, and found guilty.

RIGID DYNAMICS is that portion of theoretical Dynamics (q. v.) which, based on the theory of the free and constrained motion of *points*, applies the principles thence deduced to a *system* of points rigidly connected, so as to bear throughout the whole continuance of their motion the same invariable position with relation to each other; in other words, as no body in nature can be considered as a point, but is truly a system of points, rigid dynamics has for its aim to apply the abstract theory of dynamics to the cases actually occurring in nature. For a long time, problems of this sort were not resolved by any general and adequate method, but each class was worked out according to a method specially applicable to its particular circumstances. The great general principle discovered by the French geometer, commonly known as *D'Alembert's principle*, which applies equally to all such problems, and removes the necessity for specially investigating each particular case, was an inestimable boon to mechanical science. It is thus stated in his *Traité de Dynamique*: 'In whatever manner a number of bodies change their motions, if we suppose that the motion which each body would have in the following moment, if it were perfectly free, is decomposed into two others, one of which is the motion which it *really* takes in consequence of their mutual actions, then the other component will be such, that if each body were impressed by a force which would produce it alone, the whole system would be in equilibrium. In this way every dynamical problem can be compelled to furnish an equation of equilibrium, and so be changed into a problem of *Statics* (q. v.); and thus the solution of a difficult and complex problem is effected by means of the resolution of a much easier one. D'Alembert applied his principle to various problems on the motions and actions of fluids, the precession of the equinoxes, &c.; and subsequently, in a modified form, the same general property was made the basis of a complete system of dynamics, by La Grange, in his *Mécanique Analytique*.

RI'GOR MO'RTIS is the term usually given to the peculiar temporary rigidity of the muscles that occurs shortly after death. It begins immediately after all indications of irritability (see MUSCLE) have ceased, but before the commencement of putrefaction. In the human subject it most commonly begins to shew itself about seven hours after death, although cases are occasionally met with in which 20, or even 30, hours may have elapsed before it begins to appear. This condition of rigidity usually lasts for about 30 hours; but it may pass off in ten hours or less, or may be prolonged to four or six days. The muscles of the neck and lower jaw are first affected, then those of the trunk, then those of the upper extremities, and lastly those of the lower extremities. In its departure, which is immediately followed by decomposition, the same order is followed.

This subject has been admirably discussed by Dr Brown-Séquard in the 'Croonian Lecture' for 1861, and contained in *The Proceedings of the Royal Society* for that year. In this lecture he examines successively the relations existing between muscular irritability, *post-mortem* rigidity, and putrefaction, in a variety of cases. The following are his chief conclusions: 1. Paralysed muscles are endowed with more irritability than healthy muscles; cadaveric rigidity sets in late, and lasts long; and putrefaction appears late, and progresses slowly. 2. Experiments made on numerous animals shew that when muscular irritability is increased by a diminution of temperature, the increase has the same effect upon rigidity and putrefaction as when it is caused by paralysis. As a general rule, when there was a difference of 14° to 18° F. in the temperature of two animals of the same age and species, irritability and rigidity lasted twice or three times longer in the cooler animal than in the other, and putrefaction in the former was much less rapid. 3. It was maintained by John Hunter that cadaveric rigidity does not take place after death by lightning; but it is now known that this view is not generally true. When lightning destroys life by producing such a violent convulsion of every muscle in the body that muscular irritability at once ceases, the ensuing rigidity may be of such short duration as to escape notice; but if it causes death by fright, hæmorrhage, or concussion of the brain, cadaveric rigidity will appear as usual. 4. In animals that have been over-driven, hunted to death, &c., rigidity comes on very quickly, lasts for a very short time, and is rapidly succeeded by putrefaction; and various facts quoted by Brown-

Séquard shew that over-exertion acts similarly in man. 5. The nutrition of the muscles exerts a modifying influence on rigidity and putrefaction. In cases of death from decapitation, strangulation, sudden hæmorrhage from a wounded artery, &c., cadaveric rigidity does not begin till 16 or 18 hours after death, and lasts from six to eight days; while in a case of death from exhaustion, after a prolonged typhoid fever, rigidity became evident within three minutes after the last breathing, while the heart was still beating; disappeared in a quarter of an hour, and was at once succeeded by signs of putrefaction before the man had been dead an hour. 6. When death follows violent and prolonged convulsions (as in cases of tetanus, hydrophobia, &c.), cadaveric rigidity sets in soon (usually within an hour after death), and ceases before the end of the tenth hour; and when the convulsions were caused by strychnine, similar results were obtained.

From these facts this accomplished physiologist deduces the general law, that 'the greater the degree of muscular irritability at the time of death, the later the cadaveric rigidity sets in; and the longer it lasts, the later also putrefaction appears, and the slower it progresses.'

The exact cause of this rigidity is not accurately known. The old view that it depended on the coagulation of the blood is no longer tenable. It most probably results from the spontaneous coagulation of a fibrinous material contained in the muscular juice.

RIGVEDA, the first and principal of the four Vedas. See VEDA.

RIMA-SZOMBATH, a market-town of Hungary, on the river Rima, 23 miles north-east of Pesth. Articles in wood are largely manufactured, and there is a trade in linen and bullock's hides. Pop. 8300.

RIMINI (ancient *Ariminum*), a city of Central Italy, province of Forli, in Romagna. It is situated on the river Marecchia, and though the ancient harbour has been gradually filled up by the sands brought down by that stream, the port is still the resort of a large number of vessels engaged in fisheries, which employ nearly half the population of the town. Pop. 33,272. R. has fine streets, well-built houses, a handsome town-hall with porticoes, many fine churches, among others the cathedral built by Leon Battista Alberti, the interior of which is full of monuments; outside it is adorned with sarcophagi. It has a library, many superior schools, and two orphan asylums. Among its ancient monumental edifices still remaining, may be numbered the marble Bridge of Augustus over the Marecchia, and the marble Arch of Augustus. Its manufactures are glass and sail-cloth. R. was founded by the Umbri; it was conquered by the Romans, sacked by Sulla, plundered and destroyed several times by the Barbarians, then given by Charlemagne to the Church.

RINFORZANDO (Ital. strengthening), in Music, a direction to the performer indicating that the sound is to be given with increased tone and emphasis.

RING (Sax. *ring* or *hring*, a circle or circular line), a circle of gold or other material. The practice of wearing rings has been widely prevalent in different countries, and at different periods. Rings have been used to decorate the legs, arms, feet, toes, neck, fingers, nose, and ears. The practice of wearing rings suspended from the nose, which is bored for that purpose, has been found among various savage tribes, more particularly the South-Sea islanders. Bracelets, necklaces, and earrings have been worn among nations both savage and civilised; but the most universal and most famous use of rings is on the finger. Finger-rings are alluded to in the Books of Genesis and Exodus; Herodotus mentions that the Babylonians wore them; and from Asia they were probably introduced into Greece. The rings worn in early times were not purely ornamental, but had their use as signet-rings. The Homeric poems make no mention of rings, except ear-rings; but in the later Greek legends, the ancient heroes are described as wearing finger-rings; and every freeman throughout Greece seems afterwards to have had one. The practice of counterfeiting signet-rings is alluded to as existing in Solon's time. The devices on the earlier rings were probably cut in the gold; but at a later period, the Greeks came to have rings set with precious stones, which by and by passed from articles of use into the category of ornament. Persons were no longer satisfied with one ring, but wore two or three—and their use was extended to women. The Lacedæmonians wore iron rings. The Romans are said to have derived the use of rings from the Sabines; their rings were at first, as those of the Greeks, signet-rings, but made of iron. Every free Roman had a right to wear one; and down to the close of the republic, the iron ring was worn by those who affected the simplicity of old times. Ambassadors, in the early age of the republic, wore gold rings as a part of their official dress—a custom afterwards extended to senators, chief magistrates, and in later times to the equites, who were said to enjoy the *jus annuli aurei*, from which other persons were excluded. It became customary for the emperors to confer the *jus annuli aurei* on whom they pleased, and the privilege grew gradually more and more extensive, till Justinian embraced within it all citizens of the empire, whether *ingenui* or *libertini*. The signs engraved on rings were very various, including portraits of friends or ancestors, and subjects connected with mythology or religion; and in the art of engraving figures on gems, the ancients far surpassed artists of modern times. The later Romans, like the Greeks, crowded their fingers with rings, and the more effeminate among them sometimes had a different ring for summer and winter. Rings entered into the groundwork of many oriental superstitions, as in the legend of Solomon's ring, which, among its other marvels, sealed up the refractory Jins in jars and cast them into the Red Sea. The Greeks mention various rings endowed with magic power, as that of Gyges, which rendered him invisible when its stone was turned inwards; and the ring of Polycrates, which was flung into the sea to propitiate Nemesis, and found by its owner inside a fish; and there were persons who made a lucrative traffic of selling charmed rings, worn for the most part by the lower classes.

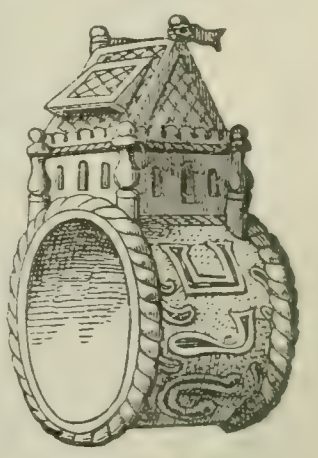

Fig. 1.

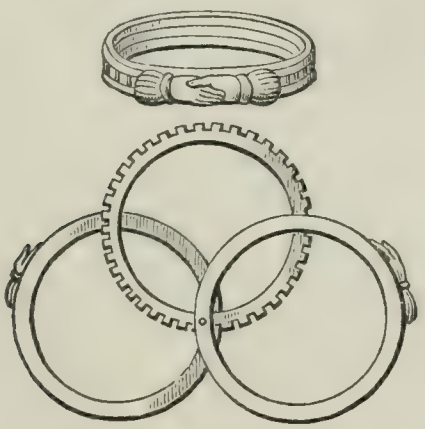

Various explanations have been given of the connection of the ring with marriage. It would rather appear that wedding-rings were worn by the Jews prior to Christian times. Fig. 1 shews a Jewish marriage ring beautifully wrought in gold filigree, and richly enamelled, now in the possession of Lord Londesborough. It has been said that as the delivery of the signet-ring to any one

was a sign of confidence, so the delivery of a ring by the husband to the wife indicated that she was admitted into his confidence. Another explanation is, that the form of the ring symbolises eternity and constancy; and it has been alleged that the left hand was chosen to denote the wife's subjection to her husband, and the third finger, because it thereby pressed a vein which was supposed to communicate directly with the heart. The third finger has always been selected as the finger on which official rings are to be worn. Bishops on their consecration receive a ring to be worn on the third finger of the right hand, in order to indicate ecclesiastical authority, and doctors were formerly in use, for a similar reason, to wear a ring on the same finger. A ring has been much used at betrothal as well as marriage, and in many parts of the continent of Europe a wedding-ring is worn by the husband as well as the wife. In Britain, rings are occasionally worn on all the fingers except the first finger and thumb; the Germans usually wear a signet-ring on the first finger. During the 16th, 17th, and 18th centuries it was a very common practice to have mottoes inscribed on rings (fig. 2), including wedding-rings, and the motto was called the *posy* or *chanson*. The ring was the symbol of the dominion of Venice over the Adriatic; and yearly, on Ascension Day, a ring was thrown by the doge from the ship *Bucentaur* into the sea, to denote that as the wife is subject to her husband, so is the Adriatic Sea to the republic of Venice.

Fig. 2.

In pagan times in Europe, the ring seems to have been connected with fidelity or with espousals. Fig. 3 shews a form of betrothal ring called a *gimmal*, or linked ring, which was used in later times; the upper fig. shews the three parts brought

Fig. 3.

together; the lower fig., the parts separately. By an ancient Norse custom, described in the *Eyrbrygia Saga*, when an oath was imposed, he by whom it was pledged passed his hand through a silver ring, sacred to that ceremony; and in Iceland the ceremony of betrothal used to be accompanied by the bridegroom passing his four fingers and thumb through a large ring, and in this manner receiving the hand of the bride, as represented in a woodcut in an old edition of *Olaus Magnus*. As lately as 1780, the practice existed in Orkney of a man and woman plighting their faith at the Standing Stones of Stennis by joining their hands through the perforated stone of Odin.

Rings were greatly used in ancient Egypt. They were called *tebh*, finger-rings, and *khatem*, signets, both kinds being represented in the sculptures and mentioned in the hieroglyphs. Besides these two classes, solid rings of gold and silver were used as money. Rings for the fingers are of the most remote antiquity, and were the emblems of rank and power. They were of two kinds; the solid ring, made of gold, silver, copper, or iron, having a square or oval bezel, on which the subject to be impressed was sunk or cut in intaglio. The oldest of these were of gold, iron not having been in use till the Roman rule over Egypt, or about the 1st c. A.D. A remarkably fine specimen is one of a Hemphite priest or flamen of the monarch Cheops, who lived in the time of the 26th dynasty, about the 5th c. B.C. But rings of this class are probably not so old as the other kind, which have a square or oblong plinth of gold, stone, or glass, on which the subjects are engraved also in intaglio. These plinths are pierced through their long axis to admit the metal ring on which they revolve, and are secured to it by wire coiled round the ring at the place of insertion. Scarabæi of glazed steatite, set in frames of gold or silver, were often used for bezels. The bezels have their base engraved with hieroglyphs and other subjects, the names of monarchs, figures of deities, mottoes, and devices. Such rings were used by functionaries; and in the account of the investiture of Joseph in the Book of Genesis, a ring was put on his finger as a symbol of his rank. The poorer classes had rings of ivory or blue porcelain, with solid oval bezels, having in intaglio similar subjects. Rings appear to have been placed on all the fingers, and even the thumb, and the hands of ladies were loaded with these costly ornaments. A cat, emblem of the goddess Bast or Pasht, the Egyptian Diana, was a favourite subject of ladies' rings. The third finger of the left hand was the ring finger. Some remarkable instances of gold rings with revolving bezels have been found, as that of Thothmes III. in the collection of Lord Ashburnham, and another with the name of the monarch Horus, which contained gold to the value of £20. Such rings could give two impressions, like the seal and counterseal of modern times. The counterfeiting of signets was a crime, and the deceased, at the great judgment of the dead, protested he had not done so.—Wilkinson, *Mann. and Cust.*, vol. iii. pp. 370 and foll.; Bonomi, *Trans. R. Soc. Lit.*, New Series, vol. i. p. 108; Prisse, *Mon. Egypt.*, Pl. xlvii.

RINGBONES consist of a circle of bony matter round the horse's coronet, are most common in the fore limbs of draught horses with short upright pasterns, and much worked upon the hard roads; but they also occasionally appear on the hind limbs of lighter-bred horses. They seldom cause lameness, except when rapidly and recently formed; but as they are apt to stiffen the neighbouring joints, they constitute unsoundness. Rest should be enjoined, and cold bran poultices or swabs, kept cool and moist by any refrigerant mixture, applied continuously until heat and tenderness are removed, when the fetlock is to be fired or dressed with fly-blister, or the ointment of the red iodide of mercury.

RING DOVE. See PIGEON.

RING MONEY. At an early stage of society, prior to the invention of coinage, but after the inconveniences of direct barter had been discovered, the precious metals, formed into rings, were used as a medium of exchange; these same rings being als serviceable in some cases as personal ornaments. The use of ring money among the Egyptians is proved by representations of gold and silver money in their paintings, an instance of which is to be

seen in one of the grottoes in the Hill of Shek Aba at Quorneh, which bears the cartouche of Amunoph II. inscribed on its walls. The gold or silver rings were formed of a wire or bar of metal bent into a circle, but not quite united at the extremities, so that it could be easily made into a chain, from which portions could be detached at pleasure. It seems probable that the individual loops were not adjusted to a particular weight, but that each bundle of loops amounted in the aggregate to a particular weight. A metallic currency of this kind seems to be alluded to in the incident in the Book of Genesis, of the Hebrew patriarchs finding their money 'in full weight' at the mouth of their sacks. Ring money, both of gold and silver, similar to what is represented in the Egyptian paintings, was brought by Mr Bonomi from Nubia. Some of the silver rings had been worn as bracelets, and were ornamented with engraved work. This kind of currency has probably never gone out of use in some parts of Africa since the remote period when it was employed in paying the exactions of the Pharaohs. Ring money for African traders is regularly manufactured at Birmingham of copper, or an alloy of copper and iron, and known under the name of 'Manillas.'

The ring money of the East found its way at an early period to Western Europe, including the British Islands. In Sweden and Norway its use seems to have continued down to the 12th c., or even later. A Norse law made about the year 1220, alludes to an established ring money, of which each ring was of a definite weight. The medieval ring money had so far advanced beyond the Egyptian as to have each ring adjusted to a special weight, for which it might pass without weighing. Cæsar mentions gold and iron rings as used in Gaul and Britain for money; and gold and silver, and occasionally brass, ring money has been dug up in many parts of Britain, consisting of bars of metal bent in a circular shape; the ends in what seem to be the older specimens are left plain; in those of later times, they are flattened and ornamented. One example, found in one of the *Weems*, or subterranean dwellings of the island of Shapinshay in Orkney, is composed of three bars of gold twisted together like a cord. A remarkable silver chain of 33 rings, weighing above 93 ounces, was dug up in 1805 near Inverness, in the course of the excavations for the Caledonian Canal, and is now in the museum of the Scottish Antiquaries. Some of the larger specimens of gold ring money are very highly decorated. The gold torque worn round the neck of the Gallic warriors, weighing sometimes as much as four pounds, besides being a personal ornament, was adjusted to a certain weight as money.

Among the various modifications of ring money in use in different countries, may be mentioned the silver fish-hook money of Ceylon, mentioned by Tavernier, of the form of a flat wire bent into a hook, and issued as late as 1659. Specimens of it have lately been dug up.

RING OUZEL (*Turdus torquatus*, or *Merula torquata*), a species of thrush, rather larger than the blackbird, which it much resembles. It is a native of Europe, and chiefly of the western parts of it; spends the winter in the south of Europe or in Africa, and visits more northern regions in summer. It is of frequent occurrence in many parts of the British Islands. It is seldom seen in the more cultivated and thickly-peopled districts, but prefers mountain slopes, heaths, and their vicinity. It makes its nest generally in heathy banks, often under a bush. The nest is of coarse grass, within which is a thin shell of clay, and an inner lining of fine dry grass. The R. O. is a constant visitor of gardens in the neighbourhood of its haunts, committing great depredations, particularly when cherries are ripening. In Scotland it is known as the *Moor Blackbird*. It is of a dark-brown colour, almost black; the feathers edged with blackish-

Ring Ouzel (*Turdus torquatus*).

gray, the feathers of the wings more conspicuously edged with gray; a crescent-shaped white collar on the throat. The song consists of a few loud, clear, and plaintive notes.

RI'NGWORM is a popular term for several distinct forms of skin-disease which occur in patches of a circular or annular form on the body, and especially on the scalp. Thus, a species of Lichen (q. v.), known to dermatologists as *Lichen circumscriptus*, in which the papules assume a circular arrangement, is commonly regarded as ringworm; and the two species of Herpes (q. v.), known as *Herpes circinatus* and *H. Iris*, in which the vesicles occur in circular patches and in concentric rings, are usually included in the same term. None of these are, however, cases of true ringworm (*Tinea tondens*), which is a disease dependent on the presence of a special vegetable (fungous) parasite, now known to botanists as the *Trichophyton tonsurans*, or hair-plant, and discovered in 1845 by Malmsten.

Parasitic Fungus from the Root of the Hair in a case of True Ringworm, highly magnified.

(Copied from Aitken's *Science and Practice of Medicine*, 3d ed.)
A, isolated spores; B, spores united at their ends; C, C, empty tubes; D, sporular tubes.

It consists of oval, transparent spores or globules, about $\frac{1}{7000}$th of an inch in diameter, for the most part isolated, but sometimes connected by articulated filaments. This fungus is seated in the interior of the hair-roots, and the hairs and the fungi simultaneously increase in size. The diseased hairs lose their elasticity and break, when they have risen a

line or two above the scalp. In these cases the short stump of hair soon loses all its characteristics. If the hair breaks before emerging from the scalp, a little prominence is formed, consisting of fungus, epidermis, and sebaceous matter, and the assemblage of such little prominences gives the scalp the rough appearance known as goose-skin. This parasite exists, according to Dr Aitken—whose *Science and Practice of Medicine* contains an excellent abstract of all that is known regarding parasitic diseases—'in the *Herpes tonsurans* of Cazenave, which is the *Porrigo scutulata* of Willan, the *Tinea tonsurans* of Bazin, and the *Trichosis furfurans* of Erasmus Wilson and Dr Wood.' There are three varieties of true ringworm, which are described by Aitken under the following names: (1.) Ringworm of the Body (*Tinea circinatus*); (2.) Ringworm of the Scalp (*Tinea tonsurans*); and (3.) Ringworm of the Beard (*Tinea sycosis*).

1. *Ringworm of the Body* first appears as a rose-coloured and slightly-elevated spot about the size of a fourpenny-piece, on which a bran-like desquamation of epidermis soon begins, accompanied by slight itching. This spot gradually increases in size, but retains its circular form; and as it extends, the healing process commences at the centre, so that the circular red patch is converted into a ring, enclosing a portion of healthy skin; and a ring thus formed may continue to increase till it reaches a diameter of four inches, or even more. It is apt to affect the face, the neck, the back, and the outside of the wrist. This form of ringworm frequently terminates spontaneously.

2. *Ringworm of the Scalp* usually occurs in children, and is especially prevalent when the nutrition is defective, or there is a scrofulous taint in the constitution. It appears in the form of round, scaly, irritable patches on different parts of the head; and the irritation often occasions the formation of minute vesicles. The hairs at these spots become dry and twisted, and are easily extracted; and when the disease advances, they break close to the scalp if an attempt is made to extract them. The stumps, and the epidermis surrounding them, become covered with a characteristic grayish-white powder, consisting of the sporules of the fungus. The diseased parts are slightly elevated and puffy, and differ from the healthy scalp in colour, being bluish or slate-coloured in dark persons, and grayish-red or yellow in fair patients. The inflammation will last as long as the growth of the fungi continues; and even when they die spontaneously, as sometimes occurs, the affected spots remain permanently bald, in consequence of the hair-bulbs having become obliterated.

3. *Ringworm of the Beard* is chiefly met with on the chin, hairy part of the cheeks, and upper lips of men; but it occasionally attacks the axillæ and pubic region of women. It commences like ringworm of the body, but when the deeper structures become affected, pustular indurations, resembling Acne (q. v.), occur, and the hairs become readily detached. On examining the hairs under the microscope, it is seen that they are thickened; that their bulbs are partially disorganised; and that the medullary portion is atrophied.

The essential point in the treatment of all the varieties of true ringworm, is to apply to the roots of the hairs a preparation which will destroy the fungus; but before this can be done, the hair must be removed, if the disease has not already effected the removal sufficiently. This is best effected with small pincers about three inches long, and constructed so that the two extremities, which should be a couple of lines broad, shall come together very exactly. Or, in place of using the forceps, an ointment, composed of lime and carbonate of soda, of each 1 part, and 30 parts of lard, may be applied, which will soon remove the hair. French dermatologists recommend the application of 'l'Huile de Cade,' or 'oil of pitch,' obtained by the dry distillation of the wood of the *Juniperus oxycedrus*, to the part from which the hairs are to be removed, believing that it lessens the sensibility, and tends to loosen the attachment of the hair. In order to destroy and remove the plant, lint dipped in a solution of sulphurous acid should be continuously applied—sulphurous acid being probably the most energetic parasiticide at present known. Amongst the solutions that have been applied with the same object, may be mentioned that of corrosive sublimate, 1 part to 250 of water. The general health must be at the same time attended to, and the internal use of cod-liver oil may usually be advantageously combined with the local applications.

Ringworm in the lower animals, as in the human subject, consists of the growth of a vegetable fungus on the surface of the skin, is common amongst young animals, is decidedly contagious, and communicable from man to the lower animals, and probably, also, from the lower animals to man. Commencing with a small itchy spot, usually about the head or neck, or root of the tail, it soon spreads, producing numbers of scurfy circular bald patches. It is unaccompanied by fever, and seldom interferes seriously with health. After washing with soap and water, run over the spots lightly every day with a pencil of nitrate of silver, or rub in a little of the red ointment of mercury, or some iodide of sulphur liniment.

RINNS OF GALLOWAY. See WIGTONSHIRE.

RI'O BRA'NCO, a river of Brazil, the largest affluent of the Rio Negro, rises near the sources of the Orinoco, in lat. about 3° N., long. about 64° W. It flows first east to long. 61° W., and then south-south-west to the Rio Negro, which it joins after a course estimated at 700 miles in length. At its junction with the Negro it is upwards of a mile in breadth, and its lower course resembles a string of lakes connected by narrow canals. Its navigation is much impeded by rapids and waterfalls.

RIO BRAVO DEL NORTE, or RIO GRANDE. See BRAVO DEL NORTE.

RI'O DE JANEI'RO, a maritime province in the south-east of Brazil, bounded on the south and east by the Atlantic. Area 18,060 sq. m.; pop. 2,150,000. The coast on the north-east is low, lined with lagoons and marshy tracts; but in the south the scenery of the shores is unusually beautiful. Mountain-ranges occupy the middle of the province, among which the peaks of the Organ Mountains, rising to from 6000 to 7000 feet, are conspicuous. Of the rivers the Parahiba is the chief. The soil is fertile, and the principal productions are sugar, coffee, cocoa, cotton, rice, and maize. The province is traversed by a railway. The capital is Praia Grande or Netherohy, which, including the district of St Domingo, contains about 16,000 inhabitants. The largest and most important town, however, is Rio de Janeiro (q. v.).

RIO DE JANEIRO, generally called **RIO**, the capital of the Brazilian empire, and the largest and most important commercial emporium of South America, stands on a magnificent harbour, 75 miles west of Cape Frio, in lat. 22° 54′ S., long. 43° 15′ W. The harbour or bay of R., said, and apparently with justice, to be the most beautiful, secure, and spacious bay in the world, is landlocked, being entered from the south by a passage about a mile in width. It extends inland 17 miles, and has an extreme breadth of about 12 miles. Of its numerous islands, the

largest, Governor's Island, is six miles long. The entrance of the bay, guarded on either side by granite mountains, is deep, and is so safe, that the harbour is made without the aid of pilots. On the left of the entrance rises the peak called, from its peculiar shape, Sugar-loaf Mountain; and all round the bay, the blue waters are girdled with mountains and lofty hills of every variety of picturesque and fantastic outline. The harbour is protected by a number of fortresses. The city stands on the west shore of the bay, about 4 miles from its mouth. Seven green and mound-like hills diversify its site; and the white-walled and vermilion-roofed houses cluster in the intervening valleys, and climb the eminences in long lines. From the central portion of the city, lines of houses extend four miles in three principal directions. The old town, nearest the bay, is laid out in squares; the streets cross at right angles, are narrow, and are paved and flagged; and the houses, generally built of granite, are commonly two stories high. West of it is the elegantly built new town; and the two districts are separated by the Campo de Santa Anna, an immense square or park, on different parts of which stand an extensive garrison, the town-hall, the national museum, the palace of the senate, the foreign office, a large opera-house, &c. From a number of springs which arise on and around Mount Corcovado (3000 feet high, and situated 3½ miles south-south-west of the city), water is conveyed to R. by a splendid aqueduct, and supplies the fountains with which the numerous squares are furnished. Great municipal improvements have within recent years been introduced; most of the streets are now as well paved as those of the finest European capitals; the city is abundantly lighted with gas; and commodious wharfs and quays are built along the water-edge. R. contains several excellent hospitals and infirmaries, asylums for foundlings and female orphans, and other charitable institutions, some richly endowed; about fifty chapels and churches, generally costly and imposing structures, with rich internal decorations; and several convents and nunneries. In the College of Pedro II., founded in 1837, the various branches of a liberal education are efficiently taught by a staff of eight or nine professors; the Imperial Academy of Medicine, with a full corps of professors, is attended by upwards of 300 students; there is also a theological seminary. The national library contains 80,000 vols. The trade and commerce of R. is great, and is annually increasing, although it was temporarily retarded by the war of secession, 1861–65. In the year 1867, the exports—of which the principal articles were coffee, 424,531,680 pounds, hides, sugar, 8,980,960 pounds, rice, cotton, 9,240,000 pounds, rosewood, rum, tobacco, horns, ipecacuanha, and tapioca—amounted to £9,558,287, and were sent chiefly to England and France; in 1862—3, the imports—of which the chief were silk, linen, woollen and cotton goods, iron, &c.—amounted to £5,502,431. The exports of coffee from Rio, in 1868, amounted to 2,265,185 sacks, of which about one-half were sent to the U. States. The imports from the U. States, in 1867, were 119,867 barrels of flour, also lumber, oil, and lard. During the year 1863, 5980 vessels, of 1,069,396 tons, exclusive of mail-steamers from Southampton and Bordeaux, entered and cleared the port. Pop. (1867) about 420,000, of which 100,000 are slaves.

The vicinity of R. was first settled by the French in 1555, but was occupied in 1567 by the Portuguese, who founded the present city, and gave to it the name of St Sebastian. For the space of 140 years after its foundation, the city enjoyed a state of tranquil prosperity, and in 1763 it superseded Bahia as the seat of government, and became the residence of the viceroys of Portugal. On the proclamation of independence in 1822 (see BRAZIL), R. became the capital of the Brazilian empire.

RIO GRANDE, a name sometimes applied to the upper course of the river Parana (q. v.) in Brazil.

RIO GRANDE, a river of Senegambia (q. v.).

RIO GRANDE, or RIO GRANDE DEL NORTE. See BRAVO DEL NORTE.

RIO GRANDE DO NORTÉ, a small maritime province of Brazil, occupies the north-east angle of the country, and is bounded on the N. and E. by the Atlantic. Area, 16,842 sq. m.; pop. (1867) 245,000. It derives its name from a river, formerly called the Rio Grande, and now called the Potengi, which flows into the Atlantic at Natal; but the principal river is the Piranhas. The surface is flat along the shores, which are skirted by many dangerous shoals, but is hilly and mountainous in the interior. Salt is obtained in large quantity from a number of salt lakes, and building-stone is abundant. The soil, generally sterile, is fertile on the river-banks. The principal crop raised is cotton, and large herds of horses and cattle are reared on the pastures, which are extensive. The capital is Natal (q. v.).

RIO GRANDE DO SUL, or, to give the name in full, SAO PEDRO DO RIO GRANDE DO SUL, a maritime province of Brazil, constituting the extreme south portion of the empire of that name. It is bounded on the N. and W. by the river Uruguay, on the S.-W. by the republic of Uruguay, and on the S. E. by the Atlantic. Area, 85,239 sq. m.; pop. (1867) 610,000, of whom 30,000 were slaves. The central districts are occupied by a range of mountains, which runs almost parallel to the Uruguay, and from which the land falls away into plains towards the Uruguay on the west, and the Atlantic on the east. Between the mountains and the flat coast regions are the large lakes Merim and Des Patos—the latter, 175 miles long and about 40 miles broad. Its salubrity of climate and fertility of soil admirably adapt it for European immigration. The great wealth of the province is in its flocks and herds, which are reared in great numbers on the *campinas* or prairies. It is stated that 500,000 cattle, whose hides and flesh are preserved, are slaughtered here annually, while as many more are driven northward for ordinary consumption. All the cereals and fruits of Central Europe can be grown here advantageously, and the inhabitants are awakening to the importance of developing the immense agricultural resources of the province. A considerable area is now covered with crops of maize, beans, wheat, and potatoes, and the agricultural products, which, till recently, were of little account, now form one-eighth of the whole exports. The gold-mines of the province yielded, in 1863, 6100 ounces, the value of which is stated at £25,000. The principal articles of export of the province are beans, horns, hair, cattle and horse hides, grease and tallow, jerked or dried beef, tongues, mandioc flour, and maize. Of the most of these articles, the quantity exported has increased so rapidly as to be in 1861 about double what it was in 1856. In 1861, the exports amounted to £1,637,846. The half of all the imports of the province consists of cotton, woollen, and linen manufactures, coals, earthenware, and hardware from Great Britain. The principal towns are Porto Alegre (q. v.) and Rio Grande do Sul. The latter, a small but prosperous and increasing seaport at the south extremity of the Lake des Patos, and close to the sea, imported in 1861 goods to the amount of £582,573, while its exports in the same year amounted to £509,843, exclusive of the produce shipped from the port of

Sao Jose do Norte (value £224,099), which may be considered a port of itself. In 1861, 1148 vessels of 250,939 tons, including the vessels engaged in the coasting-trade, entered and cleared the port.

RIOM, a small town of France, in the dep. of Puy-de-Dôme, is picturesquely situated on a hill, 1173 feet above the sea, 8 miles north-north-east of Clermont. It is built of dark lava, and is a perfect treasure of domestic architecture, especially of the Renaissance period. Linen, leather, and brandy are manufactured. Pop. 10,863.

RI'O NE'GRO, one of the principal affluents of the Amazon, rises in an unexplored district of the south of the United States of Colombia (New Granada), flows in a general south-south-east direction, and joins the Amazon at Manaos, after a course estimated at 1000 miles in length. It receives from the north the Cassiquiare (q. v.), by means of which communication is established between the Orinoco and the Amazon; also the Cababuri, Padaviry, Branco, and other large streams; from the south comes its greatest affluent, the Vaupes. It is 1½ miles broad when it enters the Amazon.

RIO NEGRO, a river of South America, forms the greater part of the boundary between the Argentine Republic and Patagonia. At its source, it is called by the natives Melly-roumey-co—i. e., *four small rivers*—from the fact that it is formed by four head-waters from the bosom of the Cordilleras. It is afterwards called by the natives Courou-roumey-co, or Black River (Span. Rio Negro), from the dark colour of its waters, caused by the depth and narrowness of its channel. It flows first north-east, then east and south-east through the plains to the Atlantic, into which it falls in lat. 41° 3′ S., after a course of upwards of 700 miles. Shoals and islands obstruct its channel, and it is navigable only for 20 miles above its mouth.

RIONE'RO, a large town of Southern Italy, in the province of Basilicata, 7 miles south of Melfi, pop. 13,804. It produces grain, maize, pulse, and wine. The inhabitants are agriculturists and shepherds. There is a great trade carried on in maple snuff-boxes, which are manufactured here.

RIOSE'CO, MEDINA DE, a small town of Spain, in the province of Valladolid, and 26 miles north-west of the city of that name, stands on two hills in a fertile district. In the middle ages, it was the centre of considerable trade, but it has much declined in recent times. The chief church is that of Santa Maria, a beautiful Gothic edifice, richly decorated, and containing several excellent pictures. Here, in 1808, a Spanish army, 50,000 strong, under Blake and Cuesta, was defeated, with a loss of 6000 men, by 12,000 French troops, under Bessières. The chief result of this battle was that Joseph Bonaparte was placed on the throne of Madrid. After the defeat, the unresisting town was sacked with more than wonted barbarity. Pop. about 4500.

RIOT is the legal name of an offence which consists in the assembling of three or more persons for an illegal purpose, or for the carrying out of a legal purpose in an illegal manner. Riots often commence in some supposed private wrong. Some degree of violence is incidental to a riot, and a degree of intimidation to the neighbourhood. A riot cannot take place unless at least three persons act in concert. When a riot becomes formidable, it is usual for the authorities to take active measures to disperse it. Thus, any justice of the peace may command the persons assembled to disperse peaceably by a form of words called reading the Riot Act, which is as follows: 'Our Sovereign Lady the Queen chargeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations, or to their lawful business, upon the pains contained in an Act of King George for preventing tumults and riotous assemblies.—God save the Queen.' If the rioters, after this formal proclamation, remain more than one hour afterwards, they are guilty of felony, and may be seized, and carried before a justice. Sometimes it is difficult to distinguish between an illegal assembly and one which is legal, though noisy and tumultuous, and the opinion of the justice of the peace is not conclusive as to its illegality. Sometimes the Riot Act is read more than once during the disturbance, in which case the second or third reading does not supersede the first.

RIOUW', a Netherlands residency or government in the Eastern Archipelago, including the Riouw, Lingga, Tambilan, Anambas, and Natuna island groups, lying between Malacca, Sumatra, Banca, and Borneo. Area, 3120 sq. miles. Pop. (1858) of the whole group about 75,000. The resident of R. also rules over the small kingdoms of Kampar, Siak, and Indragiri, on the east coast of Sumatra (q. v.), with a population of over 20,000.

The islands of the Riouw-Lingga Archipelago are mountainous, the peak of Lingga rising to a height of 3712 feet. Many of them are covered with heavy timber and a dense underwood, through which it is difficult to force a way. As far as is known, the prevailing rocks are granitic and sandstone. Gold is found in Lingga, and tin was formerly extensively wrought; but the richer mines of Sinkep and the Carimon islands, in the southern entrance of the Strait of Malacca, now yield the largest amount of that ore. Coal is also found in the Riouw-Lingga islands.

The climate is not considered unhealthy, though at times the heat is intolerable. The chief products are sago, pepper, damar resin, gambir, gutta-percha, ratans, cotton, fruits, and many varieties of fine timber. Edible nests are found in abundance, and the waters swarm with fish. Agar-agar, tripang, or bêche-de-mer, and shell-fish, are largely collected. The *Uncaria gambir* is extensively cultivated, from the leaves of which upwards of 100,000 piculs (each 133 lbs.) of gambir are yearly manufactured—700 factories, with 6000 Chinese, being employed in that industry.

The industries are manufacturing gambir, distilling arrack, weaving silks, ship-building, wood-cutting, tile and brick making, together with extensive fisheries. The original inhabitants are Malays, who are more numerous in Lingga than the other islands. The strangers are Europeans, in the pay of the Netherlands colonial government, Chinese, Buginese, and Javans. The town of Riouw is at the north-west end of the island, in a beautiful bay where there is safe anchorage.—See *Journal of the Ind. Archip.* vol. i.; Crawford's *Descriptive Dict.*; *De Residentie Riouw*, door J. J. de Hollander (Breda, 1861); and *Nederlandsch Indie* (Amsterdam, 1863).

RI'PON, a market-town, and municipal and parliamentary borough, in the West Riding of Yorkshire, 23 miles north-west of York. The market-place, to which the four principal streets lead, is spacious, surrounded by good houses and shops, and has in its centre an obelisk 90 feet high. R. is a bishop's see. The cathedral, founded 1109—1114, is cruciform, is surmounted with two uniform towers, 110 feet high at the west end, and also by a centre tower. It is esteemed one of the best proportioned churches in the kingdom. Trinity Church, built in 1826, is a fine cruciform edifice in Early English. There are other places of worship, two hospitals, and a number of important schools,

one of which, the grammar-school, has an endowment of £600 a year. The principal branches of industry are machine-making, tanning, malting, and brass and iron founding. There are also several flour-mills and varnish-factories. Pop. (1861) 6172.

RIPPLE-MARK. Undulations similar to those observed on sandy shores, and produced by the particles of sand being drifted along by the water, have been observed on the surface of sandstones of all ages. They may be held generally as indicating that the deposition of the bed on which they occur took place on a sea-beach, or under water not more than ten feet deep. Recent ripple-marks have, however, been observed at a depth of 60 feet, and there is reason to believe that mud and sand may be disturbed at much greater depths by currents of water. Loose sand also may be driven by the wind into ripple-waves, that cannot be distinguished from those produced by the receding tide.

R'ISHI (from the obsolete Sanscrit *r'ish*, see, kindred with *dr's'-*, δερκ-) is the title given to the inspired poets of the Vedic hymns, as they were supposed to have 'seen,' or, in other words, received, the Vedic hymns from the deity through the sense of sight. 'The R'ishis,' Yâska (q. v.) says, 'see the hymns with all kinds of intentions.' They were therefore the oldest poets of India, and the word R'ishi itself becomes thus even identified with Vedic poetry. At a later period, however, the title R'ishi was given to renowned authors, though they were not considered as inspired by a deity, as, for instance, to the authors of the Vedic Kalpa, works which, by all Hindu writers, are admitted to be of human authorship.—Compare Goldstücker, *Pân'ini*, &c., p. 64, ff.

RISING, in Heraldry, a term applied to a bird when represented opening his wings as if about to take flight.

RISING IN THE AIR. The name of a belief (prevalent in the middle ages) that the bodies of holy persons were sometimes lifted up and suspended in the air during the continuance of a religious ecstasy. Calmet states in his work on Apparitions that this singular phenomenon might be produced by the fervour of the Holy Spirit; by the ministry of good angels; or by a miraculous favour of God, who desired thus to do honour to his servants in the eyes of men. Numerous instances are recorded in the *Acta Sanctorum*. St Philip of Neri, in his religious ecstasies, was elevated in the air, sometimes to the height of several yards, almost to the ceiling of his room, and this quite involuntarily. He tried in vain to hide it from the knowledge of those present, for fear of attracting their admiration. St Ignatius de Loyola was sometimes raised up from the ground to the height of two feet, while his body shone like light. St Robert de Palentin rose also from the ground sometimes to the height of a foot and a half, to the great astonishment of his disciples and assistants. In the life of St Dunstan it is stated that, a little time before his death, as he was going up stairs to his apartment, accompanied by several persons, he was observed to rise from the ground; and as all present were astonished at the circumstance, he took occasion to speak of his approaching death. In a recent biography of Girolamo Savonarola, it is also stated that while that martyr was in prison, shortly before his execution, he was observed once, while in prayer, raised from the ground, and was seen distinctly suspended in the air for some short period.

These relations account for the frequency with which representations of saints are exhibited in an aërial position in medieval paintings and works of art. This belief falls in with one of the alleged phenomena of modern Spiritualism (q. v.).

RISK, in point of law, is used chiefly in reference to the sale of goods, and injury or loss to the goods before delivery. On such occasions, the question, in English law, is governed by the previous question, whether the property has passed or not by the sale. If it has, then whoever is the owner must bear the loss of the goods. In Scotland, the risk is with the buyer of goods, whether the right of property has passed or not. See CARRIER.

RISO'TTO, an elegant Italian dish, consisting chiefly of rice. Onions are shredded into a frying-pan with plenty of butter, and they are fried together until the onions become very brown, and communicate their colour to the butter. The butter is then run off, and to this is added some rich broth, slightly coloured with saffron, and the whole is thickened with well-boiled rice, and served up as a pottage, instead of soup, at the commencement of a dinner.

RISSOLE, a culinary preparation used as an *entrée*. It consists of meat or fish of any kind finely minced and made into small forms, which are then coated with a very thin crust either of pastry or of bread-crumbs mixed with yolk of egg, and fried. There is great variety in this dish.

RITE (Lat. *ritus*) is in general an external sign or action employed in religious use, and designed either to express or to excite a corresponding internal religious feeling. Such are, for instance, the uplifting or outstretching the hands in prayer, the imposition of hands in blessing, &c. The ancient Jewish religion abounded with rites and ceremonies, and through their excessive multiplication in the religions of the Gentiles, religion degenerated almost entirely into outward form. A marked distinction in this respect is drawn by our Lord (John iv. 23) between the old and the new law, which one class of Christians have interpreted as a condemnation of all external ceremonial, while even those who contend for the retention of ceremonies in Christian worship require that their use should always be accompanied and elevated by the corresponding internal spirit. The great ground of difference in the Puritan controversy in England and the corresponding disputes in continental churches, was the lawfulness of ceremonies. See GENUFLEXION, PURITAN.

The name rite is sometimes used to signify the aggregate of all the ceremonies used in a particular religious office, as the 'rite' of baptism or of the Eucharist. In a still wider sense, it is used of the whole body of distinctive ceremonial, including the liturgy employed by a particular community of Christians. In this way we speak of the 'Roman rite,' the 'Greek rite,' the 'Syrian rite,' the 'Armenian rite,' the 'Coptic' or the 'Slavonic rite.'

RITENU'TO (Ital. kept back), a term in Music implying that the speed of the movement is to be diminished.

RITORNE'LLO (Ital. return), in Music, in its original sense, a short repetition like that of an echo, or a repetition of the closing part of a song by one or more instruments. The same term has, by later usage, been applied to all symphonies played before the voices begin which prelude or introduce a song, as well as the symphonies between the members or periods of a song.

RITSCHL, FRIEDR. WILH., one of the first (perhaps the very first) classical philologists of modern times, was born at Grossvargula in Thuringia, 6th April 1806. He studied at Leipzig under Hermann, and from 1826 to 1829 at Halle, where he eagerly

availed himself of the lectures and society of Reissig. In 1832, he was called to Breslau as extraordinary professor, receiving at the same time a joint-directorship of the philological seminary there. Two years afterwards, he became ordinary professor, and spent the winter and spring of 1836—1837 on a learned tour through Italy. In 1839, he accepted an invitation to Bonn as professor of classical literature and rhetoric, where his profound yet vivid and spirited style of lecturing soon drew (and continues to draw) unusually large audiences. The Prussian government conferred on him the rank of privy-councillor in 1856. His first literary works were devoted to the Greek grammarians, as the edition of Thomas Magister (Halle, 1832), the acute and penetrating treatise, *De Oro et Orione* (Bresl. 1834), and the richly elucidatory *Die Alexandrin. Bibliotheken und die Sammlung der Homerischen Gedichte durch Pisistratus* (Bresl. 1838), sufficiently prove; but by far his greatest work is his edition of Plautus (Bonn, 1848—1853), executed with the richest critical apparatus, and exhibiting, in regard to the emendation and exposition of the text, a faculty of genial intuition worthy of Bentley. It was accompanied by a comprehensive *prolegomena* on the Plautinian metres. The work secured for him a splendid reputation among his countrymen, who consider it to have really opened up the way for the first time to a critical study of the old Roman poetry. Among the numerous productions of R. which may be regarded as preparatory to this *chef-d'œuvre*, the most important is his *Parerga Plautina et Terentiana* (Leip. 1845). More recently, his literary activity has taken another direction—viz., a systematic treatment of Latin inscriptions, with the view of illustrating the history of the Latin language. His labours in this department have been crowned with success, for R. has thrown more light upon the successive phases of the language than any other single individual. To this field belong his *Lex Rubria* (Bonn, 1851), *Titulus Mummianus* (Berl. 1852), *Monumenta Epigraphica Tria* (Berl. 1852), *Inscriptio Columnæ Rostratæ* (Berl. 1852), *Anthologiæ Latinæ Corollarium* (Berl. 1853), *De Sepulcro Furiorum* (Berl. 1853), *De Fictilibus Litteratis, &c.* (Berl. 1853), *Poesis Saturninæ Spicelegium* (Bonn, 1854), *De Titulo Metrico Lambacsensi* (1855), *De Varronis Hebdomadum Libris* (1856), *In Leges Viselliam, Antoniam, Corneliam Observationes Epigraphicæ* (1860), and *Proœmiorum Bonnensium Decas* (1862). Besides these works, R. has contributed a large number of learned dissertations to the programmes of the university of Bonn, in the *Transactions* of the Archæological Institute of Rome, and in the *Rheinisches Museum für Philologie.*

RITTER, Heinrich, German philosopher, was born at Zerbst in 1791, studied theology at Halle, Göttingen, and Berlin, from 1811 to 1815, and in 1824 was created Professor Extraordinarius at Berlin University. In 1835, he accepted a call to the university at Kiel, and went thence in 1837 to Göttingen. R. owes his literary fame especially to his profound works on the history of philosophy. The principal are: *Ueber die Bildung des Philosophen durch die Geschichte der Philosophie* (On the Education of the Philosopher through the History of Philosophy), 1817; *Welchen Einfluss hat die Philosophie des Cartesius auf die Ausbildung der des Spinoza gehabt?* (What Influence has the Philosophy of Descartes exercised on that of Spinoza?) Leip. and Altenb. 1817; *Ueber die Philos. Lehre des Empedokles* (On the Philosophical Doctrine of Empedocles), 1820, in Wolf's *Literary Analecta; Geschichte der Ionisch. Phil.* (History of the Ionian Philosophy), Berl. 1821; *Geschichte der Pythagorisch. Phil.* (History of the Pythagorean Philosophy), Hamb. 1826; *Bemerkungen üb. die Phil. d. Megarisch. Schule* (Remarks on the Philosophy of the Megaric School), Rheinisches Museum, 2d series; *Gesch. der Phil.* (History of Philosophy), vol. i.—xii. Hamb. 1829—1853; 2d ed., vol. i.—iv., 1836—1838; *Vorlesungen zur Einleitung in die Logik* (Introductory Lectures to Logic), Berl. 1823; *Abriss der Philosophisch. Logik*, Berl. 1824; *Die Halb-Kantianer und der Pantheismus* (The Half-Kantians and Pantheism), Berl. 1827; *Ueber das Verhältniss der Philosophie zum wissenschaftlichen Leben ueberhaupt* (On the Relation between Philosophy and Scientific Life in General), Berl. 1835; *Ueber die Erkenntniss Gottes in der Welt* (The Recognition of God in the World), Hamb. 1836; *Uber das Böse* (On Evil), Kiel, 1839; Philosophical Essays (Kiel, 1839—1840). R. was not a partisan of any philosophical school, but a critic of all. His writings, which are conspicuous for the learning and acuteness they display, are naturally held in high estimation by the French Eclectics, and several of his works have been translated into the French language. He died in 1869.

RITTER, Karl, an illustrious geographer, was born August 7, 1779, in Quedlinburg, in Prussia, studied in Halle, was nominated in 1820 Professor Extraordinarius of Geography at Berlin University, became subsequently member of the Academy, and Director of Studies of the Military School. He died 28th September 1859. With R., as the founder of general comparative geography, begins a new epoch in the history of geographical science. His chief works are: *Die Erdkunde im Verhältnisse zur Natur und Geschichte des Menschen* (Geography in its Relation to Nature and the History of Men), 17 vols. Berl. 1822—1854.—The work is divided into 4 parts, 1. Introduction and East Asia, in 5 vols., containing Middle Asia, High Asia, Siberia, China, and India, vol. ii.—vi.; 2. West Asia, in 5 vols. (vols. vii.—xi.); 3. Arabia (vol. xii.—xiii.); 4. The Sinai Peninsula, Palestine, Syria (vol. xiv.—xvii.), with four indexes, and an Atlas of Asia. Introduction to an Essay on a more Scientific Treatment of Geography (Berl. 1852); *Europa, ein geographisch., historisch., statistiches Gemälde* (Europe, a Geographical, Historical, Statistical Picture), 2 vols. Frankf. 1807; *Die Stupas, oder die architect. Monumente, &c.* (The Stupas, or the Architectural Monuments on the Indo-Bactrian Royal Road, and the Colossus of Bamyan), Berl. 1838. Many of his antiquarian and historico-antiquarian researches are contained in the *Monatsberichten* of the Berlin Geographical Society, and in the *Zeitschrift für allgemeine Erdkunde, &c.* Other noteworthy productions are: *Die Colonisirung von Neu Zealand* (Berl. 1842); *Blick auf das Nilquellland* (Berl. 1844); *Der Jordan und die Beschiffung des Todten Meeres* (Berl. 1850); *Ein Blick auf Palœstina und die Christliche Bevölkerung* (Berl. 1852).

RITUAL (Lat. *rituale*, a book [or collection] of rites), the name of one of the service-books of the Roman Church, in which are contained the prayers and order of ceremonial employed in the administration of certain of the sacraments and other offices of the church. The ceremonial of the offices of the Roman Church administered by bishops is contained in the books entitled *Pontificale* and *Ceremoniale Episcoporum.* The priestly offices are detailed in the Ritual. In its present form, it dates from the Council of Trent, which directed a revision of all the different rituals then in existence, which were numerous, and exhibited considerable variety of detail. Paul V., in 1614, published an authoritative edition, which has frequently been reprinted, and of which a further revision was issued by Benedict XIV. Besides the Roman Ritual, there are many diocesan rituals, some

of which are of much historical interest. In the Greek Church, as in the other eastern communions, the Ritual forms part of the general collection (which contains also the Eucharistic service) entitled *Euchologion*. In the Anglican Church, also, the *Book of Common Prayer* may be said to contain the Ritual. The most approved commentary on the Roman Ritual is that of Barrufaldo (2 vols., Florence, 1847).

RIVE-DE-GIER, a flourishing manufacturing town of France, in the dep. of Loire, stands on the Gier, in the middle of the best coal-field in France, 13 miles north-east of St Etienne by railway. There is water-communication with the Rhone by means of the Canal-de-Givors, which extends from this town to Givors, on the Rhone. South of the town is the immense and well-built basin of Couson, containing 1,500,000 cubic *mètres* of water for the supply of the canal. R. was formerly a mere stronghold, surrounded by high walls, and defended by a strong castle; and in 1815, the number of its inhabitants was under 4000. In 1862, it contained 14,402 inhabitants. Around the town, there are about 50 coal-mines in operation; and the principal manufacturing establishments are silk-mills, large and important glass-works, factories for steam-engines and other machinery, steel factories and foundries.

RIVER. Rivers are the result of the natural tendency of water, as of all other bodies, to obey the law of gravitation by moving downwards to the lowest position it can reach. The supply of water for the formation of rivers, though apparently derived from various sources, as from rain-clouds, springs, lakes, or from the melting of snow, is really due only to atmospheric precipitation; for Springs (q. v.) are merely collections of rain-water; lakes are collections of rain or spring water in natural hollows, and snow is merely rain in a state of congelation. The rills issuing from springs and from surface-drainage unite during their downward course with other streams, forming *rivulets;* these, after a further course, unite to form *rivers*, which, receiving fresh accessions in their course from *tributaries* (subordinate rivers or rivulets) and their *feeders* (the tributaries of tributaries), sweep onwards through ravines, and over precipices, or crawl with almost imperceptible motion across wide, flat plains, till they reach their lowest level in ocean, sea, or lake. The path of a river is called its *course;* the hollow channel along which it flows, its *bed;* and the tract of country from which it and its subordinates draw their supplies of water, its *basin*, or *drainage-area*. The basin of a river is bounded by an elevated ridge, part of which is generally mountainous, the crest forming the water-shed; and the size of the basin, and the altitude of its water-shed, determine, *cæteris paribus*, the volume of the river. See RAIN. The greater or less degree of uniformity in the volume of a river in the course of a year, is one of its chief physical features, and depends very much on the mode in which its supply of water is obtained. In temperate regions, where the mountains do not reach the limit of perpetual snow, the rivers depend for their increase wholly on the rains, which, occurring frequently, and at no fixed periods, and discharging only comparatively small quantities of water at a time, preserve a moderate degree of uniformity in the volume of the rivers—a uniformity which is aided by the circumstance, that in these zones, only about one-third of the rainfall finds its way directly over the surface to the rivers; the remaining two-thirds sinking into the ground, and finding its way to spring-reservoirs, or gradually oozing through at a lower level in little rills which continue to flow till the saturated soil becomes drained of its surplus moisture, a process which continues for weeks, and helps greatly to maintain the volume of the river till the next rainfall. This process, it is evident, is only possible where the temperature is mild, the climate moist, evaporation small, and the soil sufficiently porous; and under these circumstances, great fluctuations can only occur from long-continued and excessive rains or droughts. In the hotter tracts of the temperate zones, where little rain falls in summer, we occasionally find small rivers and mountain torrents becoming completely exhausted; such is often the case in Spain, Italy, Greece, and with the Orange, the largest river of South Africa.

In tropical and semi-tropical countries, on the other hand, the year is divisible into one dry and one wet season (see RAIN): and in consequence, the rivers have also a periodicity of rise and fall, the former taking place first near the source, and, on account of the great length of course of some of the tropical rivers, and the excessive evaporation to which they are subjected (which has necessarily most effect where the current is slow), not making itself felt in the lower part of their course till a considerable time afterwards. Thus, the rise of the Nile occurs in Abyssinia in April, and is not observed at Cairo till about midsummer. The fluctuations of this river were a subject of perpetual wonderment to the ancient civilised world, and were of course attributed to superhuman agency; but modern travel and investigation have not only laid bare the reason of this phenomenon, but discovered other instances of it, before which this one shrinks into insignificance. The maximum rise of the Nile, which is about 40 feet, floods 2100 sq. m. of ground; while that of the Orinoco, in Guiana, which is from 30 to 36 feet, lays 45,000 sq. m. of savannah under water; the Brahmaputra at flood covers the whole of Upper Assam to a depth of 10 feet, and the mighty Amazon converts a great portion of its 500,000 sq. m. of silvas into one extensive lake. But even these fluctuations are surpassed comparatively in Australia, where the rivers swell to an enormous height—one of them, the Hawkesbury, having been known to rise 100 feet above its usual level; which, however, is owing to the river-beds in that country being occasionally hemmed in by lofty abrupt cliffs, which resist the free passage of a swollen stream.

The increase from the melting of snow in summer most frequently occurs during the rainy season, so that it is somewhat difficult to determine, with anything like accuracy, the share of each in producing the floods; but in some rivers, as the Ganges and Brahmaputra, the increase from this cause is distinctly observable, as it occurs some time after the rains have commenced, while in the case of the Indus it is the principal source of flood. When the increase from melted snow does not occur during the rainy season, we have the phenomenon of flooding occurring twice a year, as in the case of the Tigris, Euphrates, Mississippi, and others; but in most of these cases the grand flood is that due to the melting of the snow or ice about the source. In illustration of the enormous variation in the volume of rivers subject to periodical rise and fall, we shall give a few instances in which the minimum and maximum delivery per second have been ascertained:

DELIVERY IN CUBIC FEET PER SECOND.

	Minimum.	Maximum.	Average for a Year.
Nile (at Assouan),	24,000	362,000	101,000
Ganges,	36,000	494,000	141,000
Irrawadi,	84,000 (?)	1,000,000 (?)	350,000
Brahmaputra,	146,000	1,800,000 (?)	520,000

The advantages of this periodical flooding, in

bringing down abundance of rich fertile silt—the Nile bringing down, it is said, no less than 140 millions of tons, and the Irrawadi 110 millions of tons annually—are too well known to need exposition here. Islands are thus frequently formed, especially at a river's mouth (see DELTA). Permanent and capacious lakes in a river's course have a modifying effect, owing to their acting as reservoirs, as is seen in the St Lawrence; while the Red River (North) and others in the same tract, inundate the districts surrounding their banks for miles. In tropical countries, owing to the powerful action of the sun, all rivers whose source is in the regions of perpetual snow, experience a daily augmentation of their volume; while some in Peru and Chili, being fed only by snow-water, are dried up regularly during the night.

The course of a river is necessarily the line of lowest level from its starting-point, and as most rivers have their sources high up a mountain slope, the velocity of their current is much greater at the commencement. The courses of rivers seem to be partially regulated by geological conditions of the country, as in the case of the San Francisco of Brazil, which forms with the most perfect accuracy the boundary-line between the granitic and the tertiary and alluvial formations in that country; and many instances are known of rivers changing their course from the action of earthquakes, as well as from the silting up of the old bed. The inclination of a river's course is also connected with the geological character of the country; in primary and transition formations, the streams are bold and rapid, with deep channels, frequent waterfalls and rapids, and pure waters, while secondary and alluvial districts present slow and powerful currents, sloping banks, winding courses, and tinted waters; the incline of a river is, however, in general very gentle—the average inclination of the Amazon throughout its whole course being estimated at little more than 6 inches per mile, that of the Lower Nile less than 7 inches, and of the Lower Ganges about 4 inches per mile. The average slope of the Mississippi throughout its whole length is more than 17 inches per mile, while the Rhone is, with the exception of some much smaller rivers and torrents, the most rapid river in the world, its fall from Geneva to Lyon being 80 inches per mile, and 32 inches from Lyon to its mouth.

The velocity of rivers does not depend wholly on their slope; much is owing to their depth and volume (the latter being fully proved by the fact that the beds of many rivers remain unaltered in size and slope after their streams have received considerable accessions, owing to the greater rapidity with which the water runs off); while bends in the course, jutting peaks of rock or other obstacles, whether at the sides or bottom, and even the friction of the aqueous particles, which, though slight, is productive of perceptible effect, are retarding agencies. In consequence, the water of a river flows with different velocities at different parts of its bed; it moves slower at the bottom than at the surface, and at the sides than the middle. The line of quickest velocity is a line drawn along the centre of the current, and in cases where this line is free from sudden bends or sharp turns, it also represents the deepest part of the channel. The average velocity of a river may be estimated approximately by finding the surface-velocity in the centre of the current by means of a float which swims just below the surface, and taking four-fifths of this quantity as a mean. If the mean velocity in feet per minute be multiplied by the area of the transverse section of the stream in square feet, the product is the amount of water discharged in cubic feet per minute. According to Sir Charles Lyell, a velocity of 40 feet per minute will sweep along coarse sand; one of 60 feet, fine gravel; one of 120 feet, rounded pebbles; one of 180 feet (a little more than two miles per hour), angular stones the size of an egg. The remarkable formation of natural bridges, and a general description of the erosive action of rivers, will be found under WATERFALLS. 'Rivers are the irrigators of the earth's surface, adding alike to the beauty of the landscape and the fertility of the soil; they carry off impurities and every sort of waste débris; and when of sufficient volume, they form the most available of all channels of communication with the interior of continents. . . . . They have ever been things of vitality and beauty to the poet, silent monitors to the moralist, and agents of comfort and civilisation to all mankind.' By far the greater portion of them find their way to the ocean, either directly or by means of semi-lacustrine seas; but others, as the Volga, Sir-Daria (Jaxartes), Amu-Daria (Oxus), and Kur (Araxes), pour their waters into inland seas; while many in the interior of Asia and Africa—as the Murghab in Turkestan, and the Gir in the south of Morocco—'lose themselves in the sands,' partly, doubtless, owing to the porous nature of their bed, but much more to the excessive evaporation which goes on in those regions. The following are a few of the chief rivers in each continent, with the lengths of their courses in English statute miles, and their drainage areas in English geographical square miles (the Thames is given as a standard of comparison):

	Length.	Drainage Area.
EUROPE.		
Thames,	220	5 000
Vistula,	598	57,000
Loire,	598	34,000

Amazon,	3545	1 512,000
Mississippi,	3716	982,000

In Law, when a river not navigable forms the boundary of property, it is taken to belong in equal halves to the proprietors on opposite sides; and when both sides belong to one owner, then the whole of the bed belongs to him. In the common case where it is a boundary, an imaginary line, called the *medium filum*, runs down the middle, and all the bed of the river on one side belongs to the proprietor of the land on that side. This rule

* Including basin of Brahmaputra.
† Including basin of Menam.

refers to the soil under the water, which is as absolutely the property of the riparian owner as the banks of the river themselves. As regards the water, it is true that the riparian owner on his side of the middle line has not the absolute property of the water itself, but he can use it to a limited extent—as, for example, to water his cattle, to supply the wants of his house, &c. The right of abstracting quantities of water is limited to this extent, that if, by taking more than the usual quantity required for necessary purposes, the rights of other riparian owners further down are materially injured, then the latter can bring an action to recover damages for such injury. Thus, if a riparian owner or his tenant had a mill on the river which had existed thirty or forty years, and a riparian owner further up has materially diminished the volume of water, an action of damages will be competent. So one owner cannot alter the bed or embank the river so as to injure other owners. With regard to fishing, each riparian owner has a right to fish in his half of the river, and to catch all he can find there, subject to the restrictions of the Fishery Laws. (Paterson's *Fishery Laws of the United Kingdom.*) In Scotland, the riparian owner, unless he has a grant from the crown, cannot meddle with salmon so far as net-fishing is concerned, though he may fish for salmon with the rod. It follows that a riparian owner, when fishing with the net or rod, cannot go beyond his own half of the stream; and if he cast his line beyond the mid-stream, he would be liable to an action of trespass. But it is usual for opposite riparian owners to allow each other to fish the whole stream, for this is more convenient to both parties. The restrictions as to the times of fishing and the size of nets are stated under FISHERY. Where a river is navigable, the soil belongs to the crown, and the public have *primâ facie* a right to fish in it, though individuals may prove a title to a several or exclusive fishery there, but the burden of proof lies on such individuals. As between navigation and fishing, the right of navigation is paramount, and the fisherman must yield to the navigator.

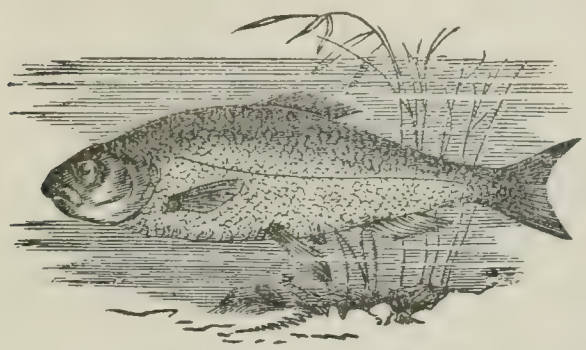
The *Poisoning of Rivers* has begun of late years to cause serious concern, in consequence of the extension of manufactures, many of which are situated on the banks of streams, and use such streams as a drain or sewer. No person has a right so to poison or pollute a stream, and if he do so, any of the persons whose lands abut on the stream lower down may bring an action to recover damages. But if these tolerate the nuisance without complaint for twenty, or, at all events, forty years, they are for ever afterwards precluded from complaining. Hence, in most cases, the manufacturers who pollute streams must be able to prove that they have been in the practice of doing so without challenge for twenty, or at most forty years. As, therefore, the law was defective in guarding salmon-rivers from this danger, the English Salmon Fishery Act enacted that all persons who poison streams without a legal right of this kind shall be liable to fine; and, moreover, even when they have the legal right, they must prove that they have used all reasonable means to counteract the ill effect of their refuse. Whoever unlawfully or maliciously puts lime or other noxious material in a pond of water with intent to destroy the fish therein, commits a misdemeanour, and may be sentenced to seven years' penal servitude. In Ireland and Scotland, the law does not materially differ from that of England as to poisoning rivers and streams; and it is an offence to put lime into streams to kill fish. — Paterson's *Fishery Laws of the United Kingdom.* Besides the offences declared by the Salmon Act of the United Kingdom, there are also similar penalties for poisoning waters, imposed by the Water-works Clauses Act, 10 Vict. c. 17, s. 61; the Public Health Act 11 and 12 Vict. c. 63, s. 80; and the Nuisances Removal Act, 18 and 19 Vict. c. 121, ss. 23, 24.

RIVER-CRAB (*Thelphusa*), a genus of crabs inhabiting fresh water, and having the carapace quadrilateral, the antennæ very short. One species (*T. depressa*), the *Granchio* of the Italians, is very common in the south of Europe, and is often figured on ancient Greek medals. It was in ancient times, as it still is, an esteemed article of food. It is much used in Italy during Lent. It inhabits muddy lakes and slow rivers. In some it absolutely swarms. It can be kept alive in a damp place for a long time. It is often brought to market tied on strings,

River-Crab (*Thelphusa depressa*).

at such distances as to prevent fighting and mutilation. This crab spends the winter deeply imbedded in the mud.—Other species are common in warm countries. *T. cunicularis* is very abundant on the Ghauts of the Deccan, in India, burrowing in the ground, and running about among the long grass. It 'runs with considerable swiftness, even when encumbered with a bundle of food as big as itself; this food is grass, or the stalks of rice; and it is amusing to see the crabs sitting, as it were, upright, to cut their hay with their sharp pincers, and then waddling off with their sheaf to their holes, as quickly as their side-long pace will carry them.'

RIVER-TERRACES occur in some valleys, and exhibit the action of the river in scooping out its bed when it flowed at a higher level than it does now. The terrace consists of a more or less steep cliff, a few feet, or it may be yards high, with a flat terrace on a level with the top of it. The cliff corresponds to the present bank, and the terrace to the alluvial plain through which the river runs. The cliffs and terraces are repeated several times in some river-basins, and they frequently correspond on the two sides of the valley. They follow the course of the river, sloping downwards, with an inclination similar to the descent of the stream. They differ in this respect from the parallel roads formed by standing water. See GLENROY.



RIVET, a metal pin for connecting two plates of metal or other material together. The rivet is put through holes in both plates, and the projecting ends are then beaten down so as to represent the head of a nail on each side, and thus hold the plates in close contact. Rivets are of most essential importance in boiler and tank making, and in building iron ships. They are often put through the holes and beaten down while red-hot, in order that the contraction of the rivet, as it cools, may produce more intimate contact of the plates. In many cases, great difficulty is experienced

in bringing a pressure upon the head of the rivet, so that the other end can be hammered upon, and it has been sought to do this by machinery. The principle of the *riveting machine* is simply the bringing a powerful lever to bear upon the head of the rivet, so that the smith can hammer upon the other and softened end without displacing it.

RI'VOLI, a town of Northern Italy, situated on the slope of a hill on the right of the river Dora, in the province and 8 miles west of the city of Turin. Pop. 10,131. It is a fine town, surrounded by country houses, is a place of recreation for the Turinese, possesses a royal castle, which was sacked by the French in 1690, and manufactures linens, silk, and liqueurs. R. was presented to the bishops of Turin in 1159 by the Emperor Frederick I.; it gave itself to the House of Savoy in 1247. In 1797, a battle was fought here between the French and Austrians, in which the former were victorious.

RIZZIO. See RICCIO.

ROACH, the name of species of *Cyprinidæ*, in America, the *Hypsilepis cornutus*, Mitch., a small carnivorous fish found all over the United States. It has several varieties. Its fins are red. The silver fin R. (*H. analostanus*) is smaller. The *H. coccogenis* is the R. of the Tennessee R. Its colours are brilliant. Also *Leuciscus rutilus* (see LEUCISCUS), a fish very plentiful in many of the lakes, ponds, and slow-running rivers of Europe. It is seldom more than a

Roach (*Leuciscus rutilus*).

pound in weight, although it has been known to reach five pounds. The upper parts are dusky-green with blue reflections, passing into silvery-white on the belly, the fins more or less red. The R. is gregarious, and the shoals are often large. It is partially migratory, ascending rivers from lakes—as from Loch Lomond—to spawn. It is much esteemed for the table, and its capture is a favourite amusement of anglers on some English rivers, particularly the Thames. It is generally caught with bait, but sometimes with a small fly. It feeds both on worms, &c., and on vegetable food.

ROAD, in the law of Scotland, is used in the same sense as Highway (q. v.) in England. Road trustees are persons who are authorised by act of parliament to make and manage a particular road, and levy tolls from the public to pay the expense. In England, road trustees necessarily mean the trustees of a turnpike road, on which alone a toll is leviable, the ordinary highways being repairable by the parish, and under the management of the highway surveyor appointed by the parish. In Scotland, by the early statutes, public roads were placed under the general management of the commissioners of supply and justices of the peace; but later local statutes authorised trustees to apportion statute labour amongst the local inhabitants for the repair of highways not turnpike. At length, General Road Acts were passed, 4 George IV. c. 49, 1 and 2 Will. IV. c. 43, and the local acts now incorporate the last general act. Practically, the roads of each county are under a separate statute, which prescribes the modes of management of the roads.

ROADS AND ROAD-MAKING. Roads form a primary element in the material advancement of a nation, being essential to the development of the natural resources of the country. Canals and railways have no doubt, in modern times, superseded to some extent the common highways; still, these retain their importance, were it only as essential auxiliaries.

The Romans were great constructers of roads, and regarded them as of vital importance for conquest and the maintenance of their empire. They are said to have learned the art from the Carthaginians. Except where some natural barrier made it impossible, the Roman roads were almost invariably in a straight line; probably because the chief means of transport then in use were beasts of burden, and not wheeled vehicles, which made the preservation of the level of less consequence. The substantial character of the Roman roads is well demonstrated by the fact, that they have in some instances borne the traffic of 2000 years without material injury. The plan of construction was pretty uniform, being that described in the article on the APPIAN WAY, one of the earliest and most famous of them. They varied in breadth from 15 to 8 feet, and had often raised footpaths at the sides, and blocks of stone at intervals, to enable travellers to mount on horseback.

The roads made by the Romans in Great Britain gradually fell into decay, and the attempts that were now and then made to repair them were insufficient to prevent England falling into a worse state with respect to its highways than most other European countries. In 1285, one of the earliest laws on the subject of roads was passed. It directed that all trees and shrubs be cut down to the distance of 200 feet on either side of roads between market-towns, to prevent the concealment of robbers in them. The first toll for the repair of roads was levied by the authority of Edward III. in 1346, on roads which now form part of the streets of London. In 1555, an act was passed requiring each parish to elect two surveyors of highways to keep them in repair by compulsory labour; at a later period, in place of the compulsory labour, the 'statute labour-tax' was substituted. But long after this, the roads even in the neighbourhood of London were wretchedly bad, and in the other parts of the country, they were still worse. For the most part, indeed, they were mere horse-tracks; the chief advantage in following them being, that they led along the higher grounds, and so avoided bogs. These trackways were usually impassable in winter; being narrow, and in many places so deep and miry as to be liker ditches than roads. So late as 1736, the roads in the neighbourhood of London were so bad that in wet weather a carriage could not be driven from Kensington to St James's Palace in less than two hours, and sometimes stuck in the mud altogether. Much curious information on the state of the roads and means of conveyance in England during the long period which elapsed from the decay of the Roman roads to the middle of the last century, will be found in vol. i. of Smiles's *Lives of Engineers*.

In laying out a new line of road, the skill and ingenuity of the engineer are taxed to make the gradients easy, with as little expense as possible in excavating and embanking (see EMBANKMENT), and to do this without deviating much from the direct course between the fixed points through which the road must pass. In order to do this, an accurate

survey of the tract, including the relative levels of its different parts, and the nature of the strata, is a necessary preliminary. The formation of an extended line of road often involves the construction of extensive bridges, viaducts, and the like, which require the greatest engineering skill.

The importance of easy gradients or inclinations in roads is well understood in a general way; but it gives a more precise idea of it to state that, while, for example, the force requisite to draw a wagon weighing 6 tons along a level macadamised road is 264 lbs., on a road with an ascent of 1 in 70 the force required is 456 lbs., i. e., $\frac{1}{70}$th part of 6 tons over and above 264 lbs. The greatest declivity which can be given to a road, so that horses may move down it with safety in a fast trot, varies according to its nature; for paved roads, 1 in 63—for those which are macadamised, 1 in 35—and for those laid with gravel, 1 in 15, have been considered the limit.

What is the best transverse form for a road, is a much debated question among engineers. All agree that it should be higher in the middle than at the sides, but some think it should be much higher than others. As a road can be better kept clear of water by a slight inclination in the direction of its length, than by any form which can be given to its cross-section, it seems preferable that it should be as nearly flat as possible, because every part of its breadth will then be equally available for traffic; whereas it is almost necessary to keep on the centre of a highly convex road, and consequently wear deep furrows there, by confining the wheels and horses to pretty much the same track. Fig. 1

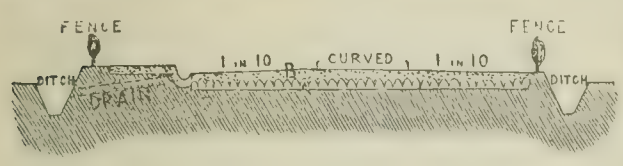


Fig. 1.—Cross Section of a Road.
A, Foundation of rough pavement or concrete; B, Broken stones.

shews a transverse section of a road of an approved form, the slope is 1 in 30, with a few feet in the centre on a flat curve.

Different opinions are also held as to whether the bed upon which the road is to be formed should be flat or rounded; those who prefer it flat considering that there should be a greater depth of material at the centre than at the sides, while others think that the depth should be uniform.

As respects the construction of the road itself, the first point to consider is the foundation. The majority of roads have no artificial foundation. In such cases, the surface on which the road-material is to be laid, is generally made as solid as possible by means of efficient drainage, and by rolling and beating wherever there are embankments formed. It is the question whether or not a road should have a foundation of rough pavement below the broken stone covering, which is the essential point of difference between the two great rival systems of Telford and Macadam. Telford considered it of great importance that there should be such a foundation. He made it of stones varying in depth from nine inches at the centre to three inches at the sides of the road, these being set with their broadest edge downwards, and no stone being more than four inches broad upon the upper edge; upon these was placed a coating of broken stones not exceeding six inches in thickness. The Glasgow and Carlisle and the Holyhead roads are excellent examples of the enduring character of those made on Telford's plan.

In our biographical notice of Macadam (q. v.) will be found a reference to his method of road-making. Suffice it here to say that he preferred a yielding and soft foundation to one which was rigid and unyielding, so that even on boggy ground, if it were but firm enough to allow of a man walking over it, he considered an artificial bottoming quite unnecessary. His roads were formed entirely of angular pieces of stone, of such a size as to pass freely through a ring 2½ inches in diameter. This plan has now fewer advocates than Telford's, or than the one subsequently proposed by Mr Thomas Hughes, where a concrete of gravel and lime is employed for the foundation of the road. But experience has shewn that Macadam's plan of employing angular pieces of stone is superior to every other as a mere covering for roads, whether they have an artificial foundation or not. So popular at one time was the system of macadamising, that expensively paved streets, such as that between Edinburgh and Leith, were torn up to be reformed on the new plan. Dublin has been instanced as an example of the failure of Macadam's plan for the streets of a populous city. There the macadamised streets are in winter constantly covered with mud, and in summer, profuse watering is required to keep them from being overwhelmed with dust. It is curious, however, that the French road-engineers have, in recent years, come to the conclusion, that a covering of broken stone alone is sufficient on the most frequented roads and under all but the very heaviest traffic.

With regard to the kind of stone suitable for covering roads, granite and the different kinds of greenstone and basalt, ordinarily called whinstones, are the only kinds admissible. Sandstone is too easily crushed, limestone is objectionable from its slight solubility in water. The stone employed should be tough as well as hard. Flint is hard enough, but it is brittle, and easily crushed to powder. The object is to get it to bind into a firm mass, and not to roll about, after it has been laid down for some time.

Little need be said about the drainage of roads, notwithstanding its great importance, because it will be apparent from what has been said, that it is in great part secured by the plan on which a road is made. What further drainage a road requires, can, in many situations, be effected by ditches on either side. Where this is not possible, as in the case of portions situated in cuttings more or less deep, proper drains require to be constructed. In such circumstances, a drain is either made down the centre, with branch-drains from the sides running into it; or drains are formed along the sides, with gratings at proper intervals to take in the surface-water. If the ground beneath the road is composed of clay or of any kind of wet soil, under-drainage must be resorted to; and of course, wherever there are footpaths, small drains require to be placed under them, if there is no other means of carrying off the water from the channel between them and the road.

ROANNE, a thriving town of France, in the department of Loire, and, after St Etienne, the most important town in the department for industry and commerce, stands on the left bank of the Loire, which is here navigable, 52 miles by railway north-west of Lyon. Its streets are wide, and its houses handsome. The chief structures are the bridge over the Loire, the public library, and the college buildings. There are important manufactures of muslins, calicoes, and woollen and other fabrics. Ship-building is carried on at the several dockyards. R. is also a most important entrepôt for commerce between the

north and south of France. Pop. (1862) 17,398. Around and within the town are to be found numerous traces of the ancient rule and civilisation of the Romans

ROANO'KE, a river of Virginia and North Carolina, U. S., formed by the union, at Clarkesville, Virginia, of the Dan and Staunton rivers, which rise in the Alleghanies, flows south-east through the north-eastern portion of North Carolina, and empties into Albemarle Sound. It is navigable for large vessels to Weldon, head of tide-water, 150 miles; its length is 260 miles. In 1861, Albemarle Island at its mouth, and Plymouth, were taken by the Federal gunboats.

ROARING, a disease of the air-passages of the horse, is characterised by a grating, roaring noise, most noticeable during inspiration, and when the animal is galloped in heavy ground. It usually depends upon wasting of some of the muscles of the larynx; is apt to result from frequent attacks of cold, from strangles, inflammation of the neck-vein, or from tight reining. It constitutes unsoundness, unfits the animal for the satisfactory performance of fast work, is apt gradually to become worse, when a sharper whistling noise is produced, and is seldom curable. In recent cases, a dose of physic should be given, a smart blister applied to the throat, or a seton inserted. As in broken-winded subjects, the breathing is much less distressed when the horse is fed and watered several hours before being required to exert himself. He should have a liberal supply of good oats, but only a limited allowance of hay, which should be given damped. In bad cases, tracheotomy may be performed, and a pipe inserted in the windpipe, with which we have known heavy draught-horses work regularly for years.

ROASTING. All the apparently numerous forms of cookery may be reduced to two, viz., Roasting and Boiling (q. v.). In this general sense, roasting may be held to include broiling, baking, and all other processes which consist essentially in the exposure of food to the action of heat without the presence of any fluid excepting its own natural juices. Chemistry and experience alike teach that the first application of heat in roasting should be powerful and rapid, so as to form an external wall, by hardening the skin, and coagulating the superficial albuminous juices, and thus retain the deep-seated juices as much as possible within the meat. This external crust is usually formed in about 15 minutes, after which the meat should be removed to a greater distance from the fire, and allowed to cook slowly. The evaporation of the internal juices may be further restrained by the free and early application of flour—a process known as dredging. The loss of weight in roasting is greater than that in boiling; but it is mainly due to the melting out of fat and the evaporation of water, while the nutritive matter remains in an easily digestible form in the interior. Rules for calculating the time a joint of given weight requires for roasting, are given in all the ordinary cookery-books. Unless the roasting is continued long enough, those parts which are nearest the centre do not become hot enough to allow the albuminous matters to coagulate, and hence they appear red, juicy, and *underdone*, as it is commonly called. The exact nature of the chemical changes which occasion the peculiarly agreeable odour of roasted meat is still unknown.

ROB, the Spanish name of a conserve of fruits. It is derived from the Arabic *roob*, signifying the juice of fruit, boiled to a sufficiently thick consistency to keep, and is supposed to have been taken from its similarity to the saccharine pulp of the locust-pods, called *Al-garoba* by the Moors. The juices of strawberries, raspberries, gooseberries, currants, &c., are boiled with sugar until they form *robs*, and are in that state used for flavouring drinks, &c.

ROBBERY is larceny from the person, preceded by violence or the fear of violence. By the present statutory law of England and Ireland, 24 and 25 Vict. c. 96, whoever robs a person is guilty of felony, and liable to penal servitude, not exceeding fourteen years, and not less than three years; or to imprisonment not exceeding two years, with or without hard labour. If, on the trial for robbery, it appear to the jury that the party charged did not commit the crime of robbery, but committed an assault with intent to rob, the party shall not be acquitted, but shall be found guilty of the assault with intent to rob. The punishment of an assault with intent to rob is penal servitude for three years, or imprisonment not exceeding two years. To constitute simple robbery, there must be what is called asportation, or a seizure of the goods. Thus, where the thief, in pulling a purse out of a pocket, could not disentangle it from keys in the pocket, and so the purse never left the pocket, it was held not robbery; but where a thief detached a lady's earring, which became lost in the curls of her hair, it was held to be robbery. In the law of Scotland, robbery also means the violent or forcible taking away of property from the person, while stouthrieff means the same offence in or near a dwelling-house.

ROBERT OF GLOUCESTER, an old English (metrical) chronicler, of whom absolutely nothing is known, except that he was alive about the time of the great battle of Evesham (1265). Robert's work is a 'history' of English affairs from the arrival of the fabulous Brutus down to the end of Henry III.'s reign; and is valuable partly for its matter (though that is in the main taken from Geoffrey of Monmouth and William of Malmesbury), but more for the language, which is there seen in its transition from Anglo-Saxon to the English of Chaucer and Wycliffe. It is written in verse, contains more than 10,000 lines, and—if we may judge from the numerous copies that were made of it—was very popular in the middle ages. The principal extant manuscripts are the Bodleian, the Cottonian, and the Harleian. The Chronicle was printed by Hearne, in 2 vols., 1724, a reprint of which appeared in 1810.

ROBERT I. (of Scotland). See BRUCE.

ROBERT II., king of Scotland, 1371—1390, was born March 2, 1316, only two years after the battle of Bannockburn. His father was Walter Stewart, and his mother, Marjory, only daughter of Robert the Bruce. R. lost both his parents in infancy. During the disastrous reign of his uncle, David II., he was one of the most prominent of the patriotic nobles of Scotland, acting as regent, or joint-regent, during the minority and exile of his sovereign. He was present at the fatal battles of Halidon Hill (q. v.) and Neville's Cross (q. v.). On the death of David, he obtained the crown, and became the founder of the Stewart dynasty, in virtue of the law of succession adopted by the Council of Estates held at Ayr in 1315. Partly from disposition, and partly from the infirmities of age, R. proved a peaceable, though not exactly a pusillanimous ruler. Such wars as were waged with England, were not only conducted, but actually organized, by his powerful and intractable barons, particularly the Earls of Douglas, Mar, March, and Moray, who shaped the policy of the country very much according to their pleasure. The misery inflicted on both sides of the borders by the raids of these warlike chiefs, and the reprisals of the English wardens

the Percies and others—was frightful; famine and pestilence became chronic; but the most celebrated incidents of R.'s reign were the invasions of Scotland by an English military and naval force under the command of the Duke of Lancaster ('old John of Gaunt, time-honoured Lancaster'), in 1385, and again by King Richard II. himself, in 1386, which wasted the land as far as Edinburgh and Fife; and the grand retaliatory expedition of the Scotch in 1388, when two armies invaded and devastated England: the larger, under the Earls of Fife and Strathearn, Archibald Douglas, surnamed the Grim, Lord of Galloway, and the Earls of Mar and Sutherland, penetrating by way of Carlisle; the smaller, under James Earl of Douglas (the 'doughty Douglas'), and the brothers Dunbar, Earls of Moray and March, by way of Northumberland. Both were completely successful. What gives a special interest to the movements of the smaller body, is the fact, that on its return home it fought and won, though at the expense of the life of its gallant leader, the brilliant battle of Otterburn, July 21, 1388. See CHEVY CHASE. R. died at his castle of Dundonald, in Ayrshire, April 19, 1390. According to Buchanan (not, however, a very accurate historian), he laboured honestly to suppress the internal disorders of the country; but, like most of the Stewarts, he was profligate in his habits. His favourite mistress, Elizabeth Mure of Rowallan, became his second wife.

ROBERT III., king of Scotland, son of the preceding, was born about 1340. His baptismal name was John, but this name, for reasons not ascertained, was changed on his accession to the throne in 1390, by an act of the Scottish Estates or parliament. His imbecility as a ruler virtually placed the reins of government in the hands of his ambitious brother, Robert, Earl of Menteith and Fife, whom, in 1398, he created Duke of Albany—during whose regime the Scottish barons first began to exercise that anarchic and disloyal authority, which, in the reigns of the first three Jameses, threatened to destroy the power of the sovereign altogether. The principal events in R.'s reign were the invasion of Scotland, in 1400, by Henry IV. of England, who, at the head of a large army, penetrated as far as Edinburgh, but did not inflict much injury on the country, more, however, from clemency than impotence; and the retaliatory expedition of the Scotch, in the following year, under Archibald Douglas, son of the Grim Earl, which resulted in the terrible disaster at Homildon Hill (q. v.). R. had two sons, the eldest of whom was David, Duke of Rothesay, a youth not destitute of parts, but shockingly licentious. As long as his mother lived, he kept within bounds, comparatively speaking; but after her death, says Buchanan, 'he gave an unbridled licence to his passions; laying aside fear and shame, he not only seduced married ladies and virgins of good family, but those whom he could not entice, he forced to his embraces.' Albany received orders from the king to act as his guardian, and after a short time, starved him to death in his castle of Falkland—for which he underwent a mock-trial by his own creatures, and was of course declared innocent. Sir Walter Scott has given the traditionary version of this tragedy in his romance, *The Fair Maid of Perth*. R. now became anxious for the safety of his younger son, James; and after consulting with Wardlaw, Archbishop of St Andrews, he resolved to send him to France; but, while proceeding thither, he landed at Flamborough, in Yorkshire, either to avoid a storm or to recover from seasickness, and was taken prisoner by the English, in 1405. When his father received the melancholy news, he gave way to paroxysms of grief, and died at Rothesay in the following year.

ROBERTSON, FREDERICK WILLIAM, M.A., an English preacher, was the son of a Scotch gentleman, Captain Frederick Robertson of the Royal Artillery, and was born in London 3d February 1816, in the house of his grandfather, Colonel Robertson. At the age of nine, he was sent to the grammar-school of Beverly, in Yorkshire, where he remained for a few years, and then accompanied his parents to the continent, where he became a proficient in French. In 1832, he entered the rector's class at the Edinburgh Academy, and there competed, we are told, 'all but successfully,' for the highest classical honours of the institution with James Moncrieff (afterwards Lord Advocate for Scotland). Next year, R. proceeded to the Edinburgh University, and while there, had for private tutor the Rev. Charles Terrot, subsequently Bishop of the Scottish Episcopal Church in the same city. He was originally designed for the bar, but the study of law did not prove interesting to him, and he would gladly have become a soldier, for he always felt (as he afterwards confessed) 'an unutterable admiration of heroic daring;' but certain difficulties intervened in the way of obtaining a commission, and R., in obedience to the wish of his father, entered Brasenose College, Oxford, to study for the church, in 1836. His life had all along been marked by its singular purity and depth of religious feeling; hence his new career inspired him with no regret, but rather with a high resolve to be worthy of his calling. His first appointment was to the curacy of St Maurice and St Mary Calendar, but his health broke down in the course of a year, and he was compelled to visit the continent. On his return to England, he was for a time curate to the incumbent of Christ Church, Cheltenham, whence, in the beginning of 1847, he removed to St Elbs, Oxford, and was just beginning to attract the notice of the undergraduates at Oxford, when he was offered the incumbency of Trinity Chapel, Brighton. His 'career' in Brighton—though it is perhaps wrong to describe a life so pure, delicate, unselfish, devoted as his, by a term expressive of vulgar ambition—was brief but glorious. For six years he continued to preach sermons, the like of which, for blending of delicacy and strength of thought, poetic beauty, and homely lucidity of speech, had perhaps never been heard before in England. R. was unhappily (for his comfort) not very 'orthodox;' consequently, he was long misunderstood, and vilified by the 'professedly religious portion of society;' but so true, so beautiful was his daily life and conversation, that he almost outlived those pious calumnies, and his death (from consumption, August 15, 1853) threw the whole town into mourning. Three volumes of his sermons, partly in the form of jottings, however, have successively appeared since his death, and have gone through numerous editions. More recently, a volume of expository lectures on the Epistle to the Corinthians appeared, which has passed through several editions in England and America. His *Lectures and Addresses on Literary and Social Topics* contain passages of faultless beauty and refinement; but as they were delivered to mixed audiences, and never intended for publication, they do not perhaps exhibit that rigorous intellectual grasp of a subject, or that strong and searching criticism, of which their author was so capable. See Brooke, S. A., *Life and Letters of F. W. Robertson*, Boston, 1870.

ROBERTSON, WILLIAM, the historian, was born in the year 1721, in the county of Edinburgh, and in the parish of Borthwick, of which his father was minister. He went to school at Dalkeith, a few miles distant from his home; but in 1733, his father's appointment to a charge in Edinburgh gave

him the opportunity of attending school and college there. He was licensed as a preacher in 1741, and in 1743 was ordained to the parish of Gladsmuir, where the battle of Prestonpans was to be fought two years afterwards. In 'the '45,' he shewed his zeal for the government cause by joining a body of volunteers formed in Edinburgh; and when the majority of his comrades saw that it was useless for them to attempt to defend the town, he, with a few whom he had infected with his ardour, went to offer their services to Sir John Cope. The latter, conscious that he had already too many elements of imperfect discipline in his army, had the prudence to decline this offer. R. afterwards became a leader in what was called 'the Moderate' side in the ecclesiastical courts; and in 1758 was promoted to one of the Edinburgh charges, where he had increased opportunities of influence. In 1759, he published his celebrated *History of Scotland*. He avowedly passed over the earlier periods, speaking of them as 'dark and fabulous,' which no doubt they were in the hands of those who had treated them; but it may be regretted that R. did not bring his acuteness to bear on the materials for their elucidation. In 1762, he was made Principal of the university of Edinburgh. In 1769, he published the *History of the Reign of the Emperor Charles V.*, to which he prefixed a *View of the State of Society in Europe from the subversion of the Roman Empire to the beginning of the Sixteenth Century*. This is the most valuable of his works. The field has been often since gone over by authors who have discovered much new material, but all the use they have made of it has become a sort of tribute to the natural sagacity of Robertson. His *History of America* was published in 1777. These works are admirable for their elegant and vigorous style. R. died in 1793. He was a genial man, with a large circle of friends. He had great conversational powers, and was reputed to be fond of displaying them. Interesting notices of his early life will be found in the autobiography of his friend Dr Carlyle, and a sketch of the closing years is given in Lord Cockburn's *Memorials of his Life and Times*.

ROBESPIERRE, Maximilien Marie Isidore de, was born 6th May 1758, at Arras, where his father was an unsuccessful advocate. Having distinguished himself at the college of his native place, he was sent through the influence of a canon of the cathedral of Arras, to complete his education in Paris, at the College of Louis le Grand, where, by a singular chance, he found himself a fellow-student with Fréron, and Camille Desmoulins. In his studies, he was noted for diligence, regularity, and intelligence; and on the completion of his course at college, he devoted himself to the study of jurisprudence. After some years thus passed, he returned to Arras, to follow the profession of his father. In this his success was decided; and previous to the commencement of his more public career, he had become a person of considerable local note. While sedulously attending to his professional duties, he cultivated literature, not wholly without distinction; and in 1783 became a member of the Academy of Arras. Of the verses which, at this time, he seems to have been fond of writing, some curious fragments are preserved. Having, it is said, in discharge of his duty as member of the criminal court, been obliged to condemn a culprit to death, he resigned his situation on a point of conscientious objection to the barbarity of capital punishment—an incident sufficiently piquant in its contrast with subsequent portions of his history. On the memorable convocation of the States-general in 1789, he had local influence sufficient to secure his election as one of the deputies of the *tiers-état*, in which capacity he immediately repaired to Versailles. In the Assembly, he was for some time of little account; but gradually he made for himself a position, and nice observers noted in him a quality of fanatical earnestness and conviction, in virtue of which they surmised for him a great career. 'This man,' said Mirabeau in particular, 'will go far, for he believes every word he says.' (*Cet homme ira loin, car il croit tout ce qu'il dit.*) Though in the Constituent Assembly he spoke frequently, and—despite the disadvantages of a mean person, a harsh, shrill voice, and an ungainly manner—always with increasing acceptance, it was outside as a popular demagogue and leader in the famous Jacobin Club that his chief activity was exerted; and in this field his influence speedily became immense. After the death of Mirabeau, whose giant figure, whilst he lived, seemed to dwarf all meaner men, his importance became more and more recognised; and from this time forward till his death, his biography is in effect the history of the revolution. In May 1791, he proposed and carried the decree by which members of the Assembly were excluded from a place in the legislature which succeeded; a measure obviously disastrous, as deteriorating the quality of the Assembly, and more and more insuring its subjection to the Jacobins, of whom R. was now the idol. His early aversion to capital punishment has been spoken of; and it is curious enough to be noted, *en passant*, that now, on the 30th May, he delivered an oration against it in the Assembly, denouncing it as 'base assassination.' On the dissolution of the Constituent Assembly in October 1791, R., now famous, revisited his native town, where he was received with enthusiasm; an escort of the National Guard did honour to his entrance, and a general illumination of the place testified the admiration of the citizens for their deputy. After a stay of seven weeks, he returned to Paris, and resumed his activity as a leader of the Jacobin Club. In the *émeute* of 10th August following, by which the king was dethroned, he took no prominent part; and though his complicity is suspected in the September massacres which ensued, no very distinct share in the infamy has ever yet been proved against him. To the National Convention, which was now formed, he was returned at the head of the Paris deputies; and as recognised chief of the extreme party called the Mountain, he was one of the main agents in procuring the execution of the king, which took place in December 1792. In the following year occurred his final struggle with the Girondists, who had twice before attacked him with a view to compass his destruction, and the chief men among whom he now triumphantly sent to the scaffold. The period of 'the Terror' followed: Marie Antoinette and the infamous Duke of Orleans were the first victims; Pétion, Danton, and Camille Desmoulins were next immolated, on a suspicion of favouring a reactionary policy; and for months, under the so-called Committee of Public Safety, Paris became the scene of an indiscriminate *quasi*-judicial slaughter, in which some thousands of lives were sacrificed. With these enormous atrocities, the name of R., along with those of his friends, Couthon and St Just, remains peculiarly associated. In the midst of the horror, took place, on 8th June 1794, that strange *Fête de l'Etre Suprême*, in which, in the name of the Republic, the existence of a Deity was decreed—a day of triumph for R., who, conspicuous as the first man in France, presided at the solemn mummery. But the end was near; men were weary of 'the Terror,' and the general sense of insecurity it induced; R. had many enemies; in particular, the numerous friends of Danton were

eager to avenge his death; a conspiracy was organised against 'the tyrant,' as he was now called, and after a scene of fierce tumult in the Convention, his arrest was accomplished. A rescue by the populace followed, but he lacked the courage and promptitude to turn the opportunity to account; whilst he hesitated, his enemies acted, and in July 1794, he closed his career on the scaffold to which he had sent so many others.

Though without great and heroic qualities, R. can scarcely have been the mean and contemptible creature he has not unfrequently been represented. The instant effect of his oratory we know; and even as read, his speeches command respect for the mental power they exhibit. The subtlest practical tact and judgment he must plainly have possessed; and though timid in his own person, he was dexterous to appropriate the results obtained by the boldness of others. In principle, he was severe and consistent; and the title of 'Incorruptible,' which he early acquired, seems throughout to have been thoroughly deserved. In private life, he was amiable; and though he waded to his public ends through blood, he had not the savage joy in the shedding of it which it has been common to attribute to him. He was callous, not actively cruel; and during the time of 'the Terror,' it is simply the truth, that he was rather reluctantly acquiescent, than active in the atrocities for which he has since been held above all others responsible. 'Death—always death!' he is said to have frequently exclaimed in private, 'and the scoundrels throw it all on me! What a memory shall I leave behind me, if this lasts! Life is a burden to me.' For a candid view of the character on this and its other sides, the more curious reader may be referred to the work on the subject by Mr G. H. Lewes—*Life of Maximilien Robespierre, with Extracts from his Unpublished Correspondence* (London, Chapman and Hall, 1849). See also the Histories of Thiers, Mignet, Carlyle, Michelet, Louis Blanc, and Ernest Hamel's *Vie de Robespierre* (Par., 1865).

ROBIN GOODFELLOW, a name given in England to a domestic spirit or fairy, analogous in character to the *Nisse God-dreng* of Scandinavia, the *Knecht Ruprecht*, i. e., Robin, of Germany, and the *Brownie* of Scotland. Roguery and sportiveness were the characteristics of this spirit; and in the reign of Elizabeth, his existence was so generally credited, that he was 'famozed in every old wives chronicle for his mad merrye prankes.' It was from the popular belief in this spirit that Shakspeare's *Puck* was derived. From the early ballads concerning R., we learn that he was the offspring of a 'proper young wench by a hee-fairy,' who was no less a person than Oberon, king of Fairyland. In his youth, R. displayed such mischievous tricks that his mother found it necessary to promise him a whipping. He ran away from home, and engaged with a tailor, from whom he also eloped. When tired, he sat down, and fell asleep, and in his sleep he had a vision of fairies. On awaking, he found lying beside him a scroll, evidently left by his father, which, in verses written in letters of gold, informed him that he should have anything he wished for, and also the power of turning himself into various shapes; but he was to harm none but knaves and queans, and was to 'love those that honest be, and help them in necessity.'

As a specimen of his 'mad prankes,' R. went one day to a wedding as a fiddler, and was a welcome guest: but in the evening 'then hee beganne to play his merry trickes in this manner. First, hee put out the candles, and then being darke, hee strucke the men good boxes on the eares; they, thinking it had beene those that did sit next them, fell a-fighting one with the other, so that there was not one of them but had either a broken head or a bloody nose. At this, Robin laughed heartily. The women did not scape him, for the handsomest he kissed: the others he pinched, and made them scratch one the other, as if they had beene cats. Candles being lighted againe, they all were friends, and fell againe to dancing, and after to supper. Supper being ended, a great posset was brought forth. At this, Robin's teeth did water, for it looked so lovely that hee could not keepe from it. To attaine to his wish, he did turne himself into a beare: both men and women seeing a beare amongst them, ran away, and left the whole posset to Robin. He quickly made an end of it, and went away without his money, for the sport hee had was better to him than any money whatsoever.'

Although R. was a sprite particularly fond of disconcerting and disturbing domestic peace, he was believed to be easily propitiated. If a bowl of milk, or curds and cream, were duly laid out for him, he would at midnight perform for the servants many household duties. If this were neglected, R. would revenge himself by pinching and otherwise annoying the inmates. The following passage in Shakspeare's *Midsummer Night's Dream* fully describes R.'s peculiarities:

> Either I mistake your shape and making quite,
> Or else you are that shrewd and knavish sprite
> Call'd Robin Goodfellow: are you not he
> That frights the maidens of the villagery;
> Skims milk, and sometimes labours in the quern,
> And bootless makes the breathless housewife churn;
> And sometime makes the drink to bear no barm;
> Misleads night-wanderers, laughing at their harm?
> Those that Hobgoblin call you, and sweet Puck,
> You do their work, and they shall have good-luck.

The *Mad Pranks and Merry Jests of Robin Goodfellow* have been reprinted from the edition of 1628, by the Percy Society, in 1841.

ROBIN HOOD'S BAY. See YORKSHIRE.

ROBI'NIA, a genus of trees and shrubs of the natural order *Leguminosæ*, suborder *Papilionaceæ*, having a 4-fid calyx, with the upper segment divided into two; stamens, nine united, and one free; the pod long and many-seeded. The species are widely diffused over the world. The most important is a North American tree, sometimes called the *Locust Tree* (q. v.), also known as the *False Acacia*, or *Thorn Acacia*, often simply designated *Acacia*. It was raised from seed in France by John Robin, about the year 1600, and gradually spread over the warmer parts of Europe and the south of Siberia. On account of its quick growth, its spines, and its property of submitting to be clipped into any form, it is very suitable for hedges. In the south of Europe, it succeeds well as a timber tree, but in more northern regions, it suffers from frost in severe winters; and in Britain it often suffers from frost, owing to the imperfect ripening of the wood in summer. The wood is compact, hard, and takes a fine polish; for many purposes, it is scarcely inferior to oak, which it rivals in toughness and strength. It does not readily rot in water, and is used for ship-building. The tree is very ornamental, and of rapid growth. It is found wild in abundance over many districts of the northern United States. Its leaves are pinnate, with 9—13 thin and smooth leaflets. The flowers are fragrant and white, in large pendulous racemes. The roots throw up many suckers, and are very sweet, affording an extract resembling liquorice. An agreeable syrup is also made from the flowers.—*R. viscosa* is a smaller tree, but even more ornamental, a native of the south-western parts of the Alleghany Mountains. It has rose-

coloured scentless flowers. The young branches are viscid.—The Rose Acacia (*R. hispida*) is a native of the south-western ranges of the Alleghanies, and is a highly ornamental shrub, with hispid branches, and large rose-coloured scentless flowers.—*R. Caragana* is a native of the south-east of Europe, and is planted for hedges at St Petersburg, where it spreads like an indigenous plant.

ROBINS, Benjamin, a celebrated English mathematician and artillerist, was born at Bath in 1707, of parents who belonged to the Society of Friends, and who were in such poor circumstances as to be unable to give their son a good education. R., however, having obtained a little instruction in mathematics, prosecuted this branch of science with great zest, and having acquired a good elementary knowledge of it, he removed, by the advice of Dr Pemberton, to London, where he set up for a teacher of mathematics. During his leisure hours, he improved himself in his favourite subject by reading the works of the ancient and modern geometers, and by the study of the Latin, Greek, and several modern languages. He also published several mathematical treatises, which gained for him considerable reputation. R. next commenced the series of experiments on the resisting force of the air to projectiles, which has gained him so much celebrity, varying his labours by the study of fortification; a science with which he obtained a practical acquaintance by visiting many of the most celebrated works of this class in Flanders. In 1734, he demolished, in a treatise entitled *A Discourse concerning the Certainty of Sir I. Newton's Method of Fluxions*, the objections brought by the celebrated Berkeley, Bishop of Cloyne, against Newton's principle of ultimate ratios. His great and valuable work, the *New Principles of Gunnery*, upon the preparation of which he had spent an enormous amount of labour, appeared in 1742, and produced a complete revolution in the art of gunnery. Previous to R.'s time, it had never been attempted to estimate the velocity of balls otherwise than by the ordinary parabolic theory of Galileo (see Projectiles). R. suggested two methods for obtaining this information—viz. (1) by finding experimentally the initial force of fired gunpowder confined to a certain space, and the law of the decrease of this force as the space increased, thence calculating the velocity which would be imparted to a body of given weight; and (2) by the *Ballistic Pendulum*. The second method has been found in practice to be much preferable for accuracy. R., in the course of his experiments, also discovered and explained the curvilinear deflection of a ball from a vertical plane. Some of his opinions having been questioned in the *Philosophical Transactions*, R. ably replied to these objectors, and also wrote several dissertations on the experiments made by order of the Royal Society in 1746—1747, for which he received their annual gold medal. In consideration of his able defence of the policy of the then government, by means of pamphlets which he wrote and published from time to time, he received (1749) the post of 'Engineer-in-general to the East India Company;' but his first undertaking, the planning of the defences of Madras, was no sooner accomplished, than he was seized with a fever, and though he recovered from it, his vital energy had been exhausted, and he died July 29, 1751. R. was considered as one of the most accurate mathematicians of his time. His mathematical works were collected after his death, and, along with the details of his latest experiments in gunnery, were published by Dr Wilson in 1761. He was the real compiler, under the *nom de plume* of Rev. Richard Walter, of Anson's *Voyage Round the World* (1740—44). See Martin's *Biographia Philosophica*.

ROBINSON, Rev. Edward, D.D., LL.D., philologist and biblical scholar, was born at Southington, Connecticut, April 10, 1794, graduated at Hamilton College Clinton, in the state of New York, in 1816, where he was engaged as tutor, and in pursuing his studies until 1821, when he went to Andover, Massachusetts, to superintend the printing of an edition of the first six books of the *Iliad*, previous to which he had married, and become a widower. He studied Hebrew with Professor Stuart at Andover, to whom he became an assistant professor. In 1826, he began four years' travel and study in Europe, where he married Miss Therese A. L. von Jakob, daughter of a professor at Halle. Returning in 1830 to Andover, he was appointed Extraordinary Professor of Sacred Literature, and librarian, but resigned in 1833, removed to Boston, and in 1837 was appointed Professor of Biblical Literature in the Union Theological Seminary, city of New York. At this period, he made, in company with Rev. Eli Smith, an extensive survey of Palestine, of which he gave an account in his admirable work, entitled *Biblical Researches in Palestine and Adjacent Countries* (3 vols. 8vo, Halle, London, and Boston, 1841)—which will always remain a standard work on the subject. He entered upon the active duties of his professorship in 1840; and in 1852 made a second visit to Palestine, of which he published an account in 1856. His other works are a translation of Buttman's *Greek Grammar*, 1832 and 1850; *Greek and English Lexicon of the New Testament*, 1836 and 1850; *Harmony of the Four Gospels*, in Greek, 1845, and in English, 1846. He was also editor of the *Biblical Repository*, *Bibliotheca Sacra*, Calmet's *Bible Dictionary*, a translation of Gesenius's *Hebrew Lexicon*, &c., and was an active member of geographical, oriental, and ethnological societies. He died in 1864.

ROBINSON, Mrs Therese Albertine Louise, wife of the preceding, and daughter of Professor von Jakob, known to the world of letters as 'Talvi,' a name composed of her initials, was born at Halle, Germany, January 26, 1797. In 1807, she accompanied her father to Russia, where he had an appointment as professor in the university of Kharkov. In 1810 they removed to St Petersburg, where she learned modern languages and history. In 1816, they returned to Halle, and there she studied Latin, and wrote a volume of tales, published in 1825 under the title of *Psyche;* and under the signature of 'Ernest Berthold,' translations of Sir Walter Scott's *Black Dwarf* and *Old Mortality*, and also two volumes of Servian popular songs—*Volkslieder der Serben*. In 1828, she was married to Professor Robinson, and in 1830 accompanied him to America, where she studied the languages of the aborigines, translated Pickering's *Indian Tongues* into German, and contributed a *Historical View of the Languages and Literature of the Slavic Nations* to the *Biblical Repository*. In 1837, she accompanied her husband back to Germany, and published *An Essay on the Historical Characteristics of the Popular Songs of the German Nations, The Poems of Ossian not Genuine*, a *History of Captain John Smith*, in German, also *The Colonisation of New England*, which was translated into English by the younger Hazlitt. Returning to New York, she has written, in English, *Heloise, or the Unrevealed Secret; Life's Discipline, a Tale of the Annals of Hungary; The Exiles;* and numerous contributions to German and American periodicals. Died in Hamburg, April, 1870.

ROBISON, John, a celebrated Scotch natural philosopher, was born at Boghall, in the parish of Baldernock, Stirlingshire, in 1739, and after a preliminary training at the grammar-school of Glasgow.

entered the university of that city in November 1750, and took his degree in 1756. He was engaged to accompany Edward, Duke of York, to sea, as his instructor in mathematics and navigation; but this arrangement being abandoned, R. accompanied in a similar capacity the son of Admiral Knowles (1758—1762). He afterwards obtained the responsible office of taking charge of the Harrison (q. v.) chronometer in its trial trip across the Atlantic; and on his return (April 1763) from this expedition, for which he was never remunerated, he returned to Glasgow to commence the curriculum of divinity study. He happened, however, at this time to renew his acquaintance with James Watt and Dr Black, and his former strong predilection for physical science underwent a vigorous revival, and was cultivated with such success that in 1766, when Black was transferred to the university of Edinburgh, R. succeeded him. In 1770, his old friend, Admiral Knowles, having been recommended by the British government to the czarina Catharine II. as the fittest person to reform the shipbuilding and naval administration of Russia, accepted the appointment of President of the Russian Board of Admiralty, and persuaded R. to accompany him as secretary. R. remained in Russia for several years, and rose high in the opinion of government, which conferred upon him various offices, both honourable and profitable. But the chair of Natural Philosophy in Edinburgh having become vacant in 1773, R. was unanimously elected, and despite the extremely tempting and flattering offers of the Russian government, he accepted the chair (1774). On leaving Russia a pension was settled on him, and he agreed to take charge of two or three of the young cadets, his former pupils. To the performance of his professorial duties, R. brought talents and acquirements of a high order; his knowledge was extensive, and included the latest discoveries of both British and foreign philosophers; his language was precise and fluent; and his views of his subject ingenious and comprehensive. But, on the other hand, his diction was too rapid, and he unfortunately disapproved of experiments, and employed them as little as possible in illustrating the great principles of natural science. In 1783, R. joined with Principal Robertson and other eminent men in reviving the old literary and scientific society (which had been founded in 1739 under the direction of Mr Maclaurin, and had been in a languishing state since 1756), which was now incorporated by royal charter, and became the Philosophical Society. The *Transactions* of this Society contain several works from R.'s pen, which are held in high esteem; and his contributions to the *Encyclopædia Britannica* were the means of elevating that work to the rank of a valuable and trustworthy book of reference. He published Black's *Lectures on Chemistry* (1803), and also a portion of a work of his own, entitled *Elements of Mechanical Philosophy*, which, together with some MSS. intended to form part of a second volume, &c., was re-published by Sir David Brewster in 4 vols. (1822), with notes. On January 28, 1805, he was seized with a severe recurrence of a former illness, brought on by a cold, and died two days afterwards.

ROB ROY, the popular name of ROBERT M'GREGOR, a celebrated Scottish outlaw, whose singular adventures entitle him to be considered the Robin Hood of Scotland. He was born between the years 1657 and 1660, and was the second son of Donald M'Gregor of Glengyle, by a daughter of Campbell of Glenlyon. R. R., in consequence of the outlawry, in 1660, of the clan M'Gregor by the Scottish parliament, assumed the name of Campbell. In Gaelic, the name *Roy* signifies *red*, and was applied to him from his ruddy complexion and colour of hair. R. R. received a fair education, and in his youth was distinguished for his skill in the use of the broadsword, in which the uncommon length of his arms was of much advantage. It was said that he could, without stooping, tie the garters of his Highland hose, which are placed two inches below the knee. Like many of the Highland proprietors of the period, R. R. dealt in grazing and rearing black-cattle for the English market. He took a tract of land for this purpose in Balquhidder; but his herds were so often stolen by banditti from Inverness, Ross, and Sutherland, that, to protect himself, he had to maintain a party of armed men, to which may be attributed the warlike habits he afterwards acquired. He also protected his neighbours' flocks, in return for which he levied a tax, which went under the name of 'black mail.' R. R. married a daughter of the laird of Glenfalloch, shortly after which he acquired the estates of Craig Royston and Inversnaid, near the head of Loch Lomond. In consequence of losses incurred in unsuccessful speculations in cattle, for which he had borrowed money from the Duke of Montrose, R. R. lost his estates, which were seized by the duke, on account of this debt. R. R. rendered desperate by his misfortunes, collected a band of about twenty followers, and made open war upon the duke, sweeping away the whole cattle of a district, and intercepting the rents of his tenants. That this could happen at so late a period, and in the immediate neighbourhood of the garrisons of Stirling, Dumbarton, and Glasgow, appears almost incredible; but R. R. enjoyed the protection of the Duke of Argyle and the respect of the country people, who gave him timely information of the designs of his enemies. Numberless stories are still current in the neighbourhood of Loch Lomond and Loch Katrine of his hairbreadth escapes from capture by the troops. At one time, a reward of £1000 was offered for his head, in consequence of which he was obliged to take shelter in a cave at the base of Ben Lomond, on the banks of the lake, which had in former times afforded a secure retreat to Robert the Bruce. Many instances have also been recorded of his kindness to the poor, whose wants he often supplied at the expense of the rich. R. R. was not the commonplace *cateran* that many people think him. He gave his sons a good education, and died peaceably in his bed about the year 1738. His funeral was attended by all the people of the district, with the exception of the partisans of his enemy, the Duke of Montrose. R. R.'s exploits have been immortalised by Sir Walter Scott in his celebrated novel of *Rob Roy*, written in 1817.

A circumstance little known in connection with R. R.'s literary tastes is, that in the list of subscribers to Keith's *History of the Affairs of Church and State in Scotland*, published in 1734, there occurs the name 'Robert Macgregor, *alias* Rob Roy.

ROC or **ROCK**, a fabulous bird, represented as of immense size, and 'able to truss an elephant' in its talons. It is perhaps enough to refer to the *Arabian Nights' Entertainments*, as to the size and power of the Roc. A belief in its existence prevailed throughout the middle ages, and it is noticed in many works of that period. The fables concerning the R. may have originated in exaggerated stories of some of the great eagles, or of the Lammergeier.

RO'CAMBOLE (*Allium scorodoprasum*), a plant of the same genus with garlic, onion, leek, &c., and nearly allied to garlic, which it resembles in its habit, although larger in all its parts. The upper part of the stem is in general spirally twisted before flowering. The root forms rounder cloves than

those of garlic, and of much milder flavour; the umbels are also bulbiferous. R. has long been cultivated in kitchen-gardens, although it has never become very common in them. It is a native of sandy soils in Denmark and other countries near the Baltic.

ROCCE'LLA. See ARCHIL.

ROCH or ROCK ALUM, a name formerly given to pure alum in mass; but it is now applied to a particular variety found at Civita Vecchia, in the Roman States. It is a kind of native alum, free from iron, but having a reddish colour, derived from the soil in which it is found. It is also called Roman, and red alum. A factitious kind is now in general use, made of common alum reddened with Armenian bole.

RO'CHDALE, a thriving manufacturing town of Lancashire, a market-town and parliamentary and municipal borough, in the valley of the Roche, and built on both sides of that stream, 11 miles north-north-east of Manchester, and 200 miles north-west of London by railway. The parish church, placed on an eminence, and approached by a flight of steps, is a venerable edifice, dating from the 12th c., and built partly in late Norman, and partly in Perpendicular. The other public buildings comprise churches, chapels, and meeting-houses for the various dissenting sects, and other important institutions. A fine town-hall has recently been erected. The houses are, for the most part, built of bricks, and roofed with stone. Many improvements in the architectural and sanitary condition of the town have been made within recent years. With all the improvements, however, R. is beautiful only in site, and derives its importance wholly from its extensive and varied manufactures. The woollen manufacture, introduced here by a colony of Flemings in the reign of Edward III., is in a prosperous state, and is increasing in importance. Blankets, baizes, kerseys, and other woollen fabrics are the staple manufactures. Cotton goods also, especially calicoes, are largely manufactured. In the vicinity, coal is found, and flagstones, freestones, and slates are abundantly quarried. A good general trade is carried on; there are several hat-factories, cotton-mills, machine-shops, iron and brass foundries, &c. There are weekly markets for woollen goods and grain, and fortnightly fairs for cattle. The commerce of the town is facilitated by abundant means of communication. Pop. (1861) of municipal borough, 38,114. R. returns one member to the House of Commons.

ROCHEFORT-SUR-MER, an important seaport and naval arsenal of France, in the dep. of Charente-Inférieure, stands on the right bank of the Charente, 5 miles from its mouth. It is surrounded by ramparts, and protected by forts at the mouth of the river; and is a modern, clean, well-built town. Few French towns can be compared with R. for the number and importance of its public works. The harbour, which is one of the three largest in France, is deep enough to float large vessels at low water. R. has fine wharves, extensive magazines, dock-yards, rope-walks, cannon foundries, and other establishments designed for the manufacture and preservation of naval stores and marine apparatus of every kind, including extensive bread and biscuit stores. The most celebrated of its many institutions are the marine hospital, founded in 1787, and provided with 1240 beds for seamen, besides wards for invalided officers; the artillery and naval schools for every branch of the profession, and the general civil college. Its convict-prison, which had accommodation for 1000 prisoners, has been disused since 1852, and the convicts are now transported to Cayenne. In addition to the extensive trade arising from the special character of the place, R. is the centre of the commerce of the department, and is largely engaged in colonial trade, in the manufacture of brandy, and in the building men-of-war and of merchant-ships, steamers, and coasting-vessels. Pop. (1866) 30,151.

ROCHEFOUCAULD. See LAROCHEFOUCAULD.

ROCHELLE, LA, a fortified seaport of France capital of the dep. of Charente-Inférieure, on ar. inlet of the Bay of Biscay, formed by the islands Ré and Oleron, 300 miles south-west of Paris by railway. The inner harbour, which has two basins, in which ships of any size may remain afloat, is surrounded by fine quays and commodious docks, close to which lie the principal streets and squares. Many of the latter are regular and well built, and present a handsome appearance from the number of houses which are adorned with porticoes and balconies. The public buildings most worthy of notice are the arsenal, the palace, the town-hall, the exchange, and the cathedral. Besides the fine promenade of the Place du Château, there are, outside the city walls, two extensive public gardens, known as La Promenade du Mail and the Champs de Mars. Ship-building is actively carried on here, more especially in connection with the Newfoundland fishing-trade; and besides this branch of industry, and the manufacture of cotton yarns, R. has numerous glass-works, sugar-refineries, and distilleries for the preparation of brandy. Pop. (1862) 18,904.—R., which was known till the 12th c. under its Latin name of *Rupella*, or Little Rock, of which its present name is a mere translation, originated in a colony of serfs of Lower Poitou, who, fleeing from the persecution of their lord, settled on the rocky promontory between the ocean and the neighbouring marshes, which had previously been occupied by fishermen only, but which rapidly increased in importance under the new settlers. On the marriage of Eleanor of Aquitaine with Henry II. of England, R., as a part of her dowry, came into the possession of the English kings, by whom it was retained till 1224, when it was taken by the troops of the French king, Louis VIII.; and although it was ceded to England at the treaty of Bretigny in 1360, in the subsequent wars it was retaken by France, under whose sway it has remained since 1372. As a stronghold of the Huguenot party, it underwent various attacks and sieges during the religious wars of the Henries, in the latter half of the 16th c.; and on its final and unconditional surrender to the royal troops in the time of Louis XIII., its old fortifications were destroyed, and new lines of defences subsequently erected by the great Vauban.

ROCHELLE SALT is the popular name of the tartrate of soda and potash ($C_8H_4KNaO_6.4H_2O$), this salt having been discovered, in 1672, by a Rochelle apothecary named Seignette. It occurs, when pure, in colourless transparent prisms, generally eight-sided; and in taste it resembles common salt. It is prepared by neutralising acid tartrate of potash (formerly known as bitartrate) with carbonate of soda. After a neutral solution has been obtained, it must be boiled and filtered, and the resulting fluid must be concentrated till a pellicle forms on the surface, when it must be set aside to crystallise.

This salt is a mild and efficient laxative, and is less disagreeable to the taste than most of the saline purgatives. From half an ounce to an ounce, dissolved in eight or ten parts of water, forms an average dose. A drachm of Rochelle Salt added to

one of the ingredients of an effervescing draught (bicarbonate of soda or tartaric acid, for example), forms one of the varieties of what are called Seidlitz powders.

RO'CHESTER, an episcopal city, parliamentary and municipal borough, and river-port of Kent, stands between Chatham (q. v.) on the east, and Strood on the north-west, on the right bank of the Medway, 36 miles east-south-east of London, by the London, Chatham, and Dover Railway. Together with Chatham and Strood, it forms in effect one large town. The city is surrounded on two sides by the river; and its ancient castle and cathedral, the numerous martello towers along its shores, and the works connected with the Chatham lines of fortification, render its appearance highly striking. The bishopric of R. was founded in 604; but the early Saxon cathedral suffered from the ravages of the Danes, and was in a completely ruined condition at the time of the Norman Conquest. Gundulf, who was consecrated Bishop of R. in 1077, began to rebuild the cathedral and the priory connected with it; the dormitory, chapter-house, and refectory were added under the succeeding bishop; and the new cathedral was dedicated in 1130, in presence of the king and a great company of bishops. The cathedral, the nave and crypt of which are Norman, and the choir and transepts Early English, is 310 feet long, and the western transept is 123 feet, and the nave and choir 68 feet broad. Of the ancient Norman priory, only a small fragment remains. The castle, crowning an eminence, and overlooking the cathedral, is a Norman keep, built in a wonderfully strong and solid style of masonry. R. carries on little trade, and less manufactures. In 1863, 4357 vessels, of 356,417 tons, entered and cleared the port. R. returns two members to the House of Commons. Pop. (1861) 16,862.

R., which is surmised to have existed prior to the Roman invasion, was called by the Romans *Durobrivæ*, and, according to Bede, derives its present name (*Hrofs-ceaster*, Hrof's Castle) from that of Hrof, a Saxon chieftain.

ROCHESTER, a city of New York, U.S., is on the Genesee River, 7 miles south of its entrance into Lake Ontario, where it is crossed by the Erie Canal and the Central Railway, and is the terminus of the Genesee Valley Canal and Railway, 229 miles west-north-west of Albany. In the centre of the city are the upper falls of the Genesee, a perpendicular cataract of 96 feet. Two other falls of 84 and 25 feet are a mile and a half below, the river running through a deep gorge in its limestone banks, from 100 to 220 feet high. The city is well built, chiefly of bluish limestone, with broad, shaded streets, and there are nearly as many houses as families. The falls give water-power to 18 large flour-mills and other manufactories. The canal crosses the river on a handsome aqueduct of seven arches. There are 52 churches, 19 public schools, 41 academies, a university, theological seminary, athenæum, Protestant and Catholic hospitals, a reformatory, and county offices, 15 banks and bankers, 4 savings banks, with $10,000,000 on deposit, 3 daily and 4 weekly papers. The rural cemetery of Mount Hope, and Power's building, which cost about $1,000,000, are among the ornaments of the city. The suburbs are highly cultivated, having 4000 acres of fruit-trees, and nurseries of 250 to 500 acres. The nursery trade of Rochester is unrivalled by that of any other locality in the world. There is a good harbour at the mouth of the river, and a considerable commerce by the lake. R. was settled in 1810; in 1820, its population was 1502; in 1840, 20,191; in 1860, 48,243; in 1870, 62,424.

ROCHESTER, John Wilmot, second Earl of, has left a name notorious for wit and profligacy. He was born April 10, 1647, at Ditchley, Oxfordshire, his father being Henry, first earl, better known as the Lord Wilmot of Clarendon's *History*. He was entered of Wadham College, Oxford, when only 12 years of age; and at 14 was, with other persons of rank, made M.A. by Lord Clarendon in person. After travelling in France and Italy, he attached himself to the court, and rose high in favour with Charles II., who made him one of the gentlemen of the bedchamber, and comptroller of Woodstock Park. In 1665, he went to sea in the fleet commanded by the Earl of Sandwich, and behaved at Bergen with great intrepidity. His account of the attack is described in a letter to his mother given in Wordsworth's *Ecclesiastical Biography*. He had entered into a formal engagement with his friend Mr Windham, 'not without the ceremonies of religion, that if either of them died, he should appear, and give the other notice of the future state, if there was any.' Windham was killed in the action, but did not afterwards disturb the repose of his friend. R. incurred the displeasure of the king, and was committed to the Tower, for the forcible abduction of a celebrated beauty and heiress, Miss Mallet, who was rescued by her friends, but whom he subsequently married before he was 20 years old. His wit and love of pleasure made him the favourite of a dissolute court. He once harangued the populace as a mountebank from a stage on Tower Hill, and is said to have occasionally persuaded the 'merry monarch' to disguise his rank, and accompany him in the pursuit of frolic and adventure. His genius and activity of mind led him to withdraw at times from scenes of gallantry and licentious merriment. He cultivated the Muses with success, and Anthony Wood speaks of him as the greatest scholar among the nobility of his day. As he grew older, he gave less of his time to study, and more to the company of vicious companions, and indulgence in wine. His constitution being undermined by excess and voluptuousness, he died at the early age of 34. Bishop Burnet has left an interesting account of his death under the title of *Some Passages of the Life and Death of John Earl of Rochester*, from which it appears that he became a sincere convert to the truth of Christianity, and sincerely repented his immoral and dissolute courses. He wrote some love-songs, an elegant *Imitation of Horace on Lucilius*, a *Satire against Man*, in which he is much indebted to Boileau, and an *Essay on Nothing*, which is perhaps his best performance.

RO'CHET (Lat. *rochetus*, or *rochettus*), a portion of the church costume of bishops, abbots, prelates, canons of certain privileged chapters, and some other dignitaries. It is usually of lawn or lace, and is of the form of a surplice, but with close-fitting sleeves. In the Latin Church, its use is very ancient, although its form has varied at different times. In the first Prayer-book of Edward VI., which preserved a considerable part of the Roman episcopal costume, the rochet was ordered to be worn by bishops in the communion service. The rochet, however, must not be confounded, as is often done by writers on clerical costume, with the Dalmatic and Tunic, tight and close-fitting vestments of coloured silk, worn by bishops under the *Planeta* (q. v.).

ROCK. Though popularly restricted to masses of indurated matter, this term is extended by geologists to all substances which make up the crust of the earth, whether they be loose and friable like soil and sand, or compact and indurated like limestone and granite. The rocks of the earth's crust will be found described under the heads

AQUEOUS and IGNEOUS ROCKS, to which the reader is referred.

ROCK, a kind of sweetmeat, made of sugar, sometimes mixed with almonds and various flavouring materials. The sugar is first boiled, and then poured out upon a cold marble slab, and worked up into a rough mass.—The term is also frequently applied to another form of sweetmeat, in which the sugar, whilst hot and soft, is pulled repeatedly over a smooth iron hook, until it becomes white and porous. This is also flavoured with peppermint or other essences.

ROCK, COCK OF THE (*Rupicola aurantia*), a bird of the order *Insessores;* tribe *Dentirostres;* family *Pipridæ* (Manakins, &c.), regarded by many as a sub-family of *Ampelidæ*. The *Pipridæ*, or Manakins, are a pretty large group of birds, many of them of very curious and beautiful plumage, most of them inhabitants of America, and only of the tropical parts of it. They have the bill broad at the base, the nostrils at the side nearly hidden by feathers; the wings rather short, but pointed; the tail very short and even; the legs (*tarsi*) long and slender. In the genus *Rupicola*, the bill is strong; and the species sometimes called *Rock-manakins* are comparatively large birds, having a double vertical

Cock of the Rock (*Rupicola aurantia*).

crest on the head, with the feathers disposed in a fan-like manner. The Cock of the R. is a native of Guiana and of other north-eastern parts of South America. It is remarkable for its bright orange-coloured plumage—the quill-feathers of the wings, however, being black, and the tail tipped with yellow—its large crest overhanging the bill, and its wary habits. It is a solitary bird, inhabiting rocky places, retiring into a hiding-place during the day, and coming forth to feed at sunrise and sunset. The tips of the crest-feathers are tinged with brown and yellow. The wing-coverts and upper tail-coverts are loose flowing plumes, giving a resemblance to gallinaceous birds. The size is about that of a common pigeon.—The Peruvian Cock of the R. (*R. Peruviana*) is less brilliant in plumage than the Guiana species.

RO'CKALL stands on a sandbank in the North Atlantic Ocean; this bank is nearly 100 miles in length, and 40 in breadth. The rock itself is situate in 57° 35′ N. lat., 13° 40′ W. long., about 300 miles west of North Uist, in the Outer Hebrides, and is of a rounded form, rising about 18 or 20 feet above the sea. It is frequented by large flocks of sea-birds, and the place was found a few years ago to be surrounded by considerable shoals of the larger kinds of fish, chiefly *Gadidæ* and *Pluronectidæ*. A company was formed in 1861 to carry on a fishery at the place; but the supply not proving so great as was anticipated, and the distance from the markets being very considerable, the speculation proved to be very unprofitable. There are still a few fish about R., but they are caught by private fishermen.

ROCK BUTTER, a mineral substance, consisting of Alum (q. v.), mixed with alumina and oxide of iron, of a pasty consistency, and appearing as an exudation oozing out of rocks which contain alum. It is always greasy to the touch, but is often hard enough to exhibit a straight foliated fracture. It is very easily broken. It occurs in most of the places where alum is procured.

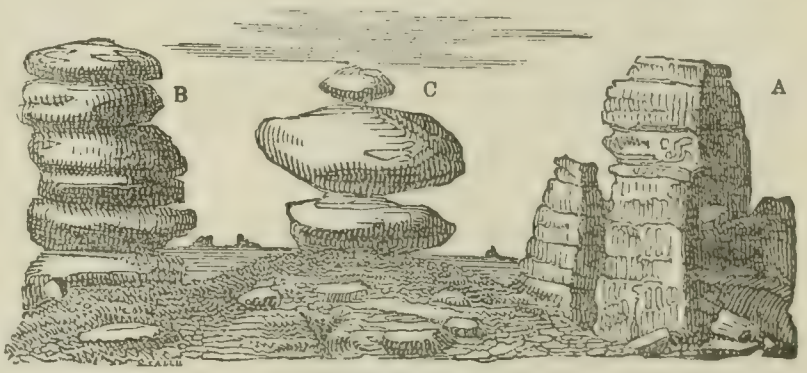
ROCK CRYSTAL, a popular and partly also a scientific name for the finest and purest Quartz (q. v.), seldom applied, however, to small crystals which are mere six-sided pyramids, but more generally to those in which the six-sided prism is well developed. The name is sometimes limited to colourless and perfectly transparent quartz, but is also more rarely extended to that which is violet or amethystine (*Amethyst*, q. v.), red (*Bohemian Ruby* or *Silesian Ruby*), wine-yellow (*Citrin* or *Gold Topaz*), brown or smoky (*Smoke Quartz, Cairngorm Stone*), &c. The beauty of specimens of R. C. is sometimes very great. The crystals are sometimes slender, crossing and penetrating each other in exquisite groups. They sometimes enclose other substances, which are beautifully seen through the transparent R. C., as slender hair-like or needle-like crystals of hornblende, asbestos, oxide of iron, rutile or oxide of titanium, oxide of manganese, &c., and such specimens are known by various fanciful names, as *Thetis's Hair-stone, Venus's Hair-stone, Venus's Pencils, Cupid's Net, Cupid's Arrows*, &c.; and sometimes the enclosed substances are small spangles of iron-glance, or crystals of iron pyrites, or native silver in fern-like leaves, or spangles of gold. Very large crystals of perfectly pure R. C. are sometimes found. One found in the Alps, and which was among the treasures carried from Italy by the French in 1797, is 3 feet in diameter, and weighs 8 cwt. R. C. was prized by the ancients, and was used by them, as it still is, for vases, cups, seals, &c. An important modern use of it is for lenses of spectacles, &c., its hardness rendering it much less liable to be scratched than glass. Lenses of R. C. are often called *Pebble* lenses.

RO'CKET, a name given to a number of plants of the natural order *Cruciferæ*, and belonging to the genera *Brassica, Sisymbrium, Erysimum, Barbarea, Hesperis*, &c.—GARDEN R. (*Brassica Eruca*, or *Eruca sativa*) is an annual plant, a native of Austria, with stem two feet high, upright and branching; the leaves smooth, succulent, cut and toothed. When in flower, it has a strong, peculiar, and disagreeable smell; but when it is very young, this smell is almost imperceptible, and the leaves are used as a salad, for which it is frequently sown on the continent of Europe, and was formerly cultivated also in Britain.—The name GARDEN R. is also given to *Hesperis matronalis*, also called Dame's Violet (q. v.), a favourite ornament of our flower-borders.—The YELLOW R. of our flower-borders is a double-flowered variety of *Barbarea vulgaris* (see CRESS).—The WILD R. (*Sisymbrium officinale*, or *Erysimum officinale*) is common in Britain, and is sometimes sown and used as a spring pot-herb.

ROCKET is a firearm capable of taking effect at a long range. The rocket consists of a light

tubular case of pasteboard, or thin metal, charged to the muzzle with a composition consisting of saltpetre 68 parts, sulphur 12 parts, charcoal, or mealed powder, 32 parts. This composition is rammed hard into the case, the centre being left void. To the rocket is attached a long stick, which serves (like the tail of a kite) to straighten its course. See PYROTECHNY. When lighted at the end the stream of gases propels the mass on the principle explained under BARKER'S MILL. As a mere firework, rockets are made of a few ounces in weight: as intended to throw light upon a town or a hostile work, they average from ½ lb. to 2 lb. These light rockets were improved by Sir William Congreve, who so contrived them, that, when over the necessary point, the rocket discharged a number of light balls, which burned in the air for several minutes with great brilliancy, while others at the same point released small parachutes, which sustained a bright light for a still longer time. But Sir William Congreve did more: he converted the rocket into a terrible weapon of war, with ranges which no ordnance of that day could attain. Discarding the small sizes, he made 12-lb., 18-lb., and 32-lb. rockets, which he charged with canister-shot, bullets, and other missiles. The stick for a 32-lb. rocket is 18 feet in length, and the maximum range 3500 yards. The range can be also increased by discharging the rocket from a cannon, with a time-fuse to ignite it at the cannon's utmost range, when the rocket commences its own course. As missiles, these rockets are found to annoy most seriously the defenders in any fortified work, and, in a bombardment, they speedily set houses and buildings on fire. In the field, also, the plunging, ricochetting motion of the rocket greatly disturbs both cavalry and infantry. The Congreve rockets were first tried on actual service, and with fatal effect, at the attack on Copenhagen in 1807.

Congreve Rocket.



One great advantage in a rocket is, that it has no recoil against the stand from which it is fired; the largest rocket may therefore be discharged without danger from the smallest boat; consequently, in naval attacks on maritime fortresses, a flotilla of rocket-boats is a very common auxiliary.

ROCK-FISH. See WRASSE.

RO'CKFORD, a city of Illinois, U. S., on both sides of Rock River, 92 miles west-north-west of Chicago, on the Chicago and Galena Railway. It is the centre of a rich country, with county buildings, 5 banks, 3 newspapers, 15 churches, and factories supplied with water-power by the rapids of the river. Pop. in 1860, 7363; in 1870, 11,049.

ROCKING-STONES, or LOGGANS, are large masses of rock so finely poised as to move backwards and forwards with the slightest impulse. They occur in nearly every country. Some of them appear to be natural, others artificial; the latter seem to have been formed by cutting away a mass of rock round the centre-point of its base. The former are chiefly granitic rocks, in which felspar and porphyry are abundantly present, and these ingredients becoming rapidly decomposed, and the dust and sand washed away by rains, what was formerly a solid rock soon assumes the appearance of a group of irregularly-shaped pillars, having a rhomboidal horizontal section, and separated into portions by horizontal and vertical fissures. As decay proceeds, the edges of the blocks forming the pillar are first attacked and disappear, as is also the case with greenstone and basalt, and the pillar now becomes a pile of two or more spheroidal rocks, resting one upon the other (see fig., where A, B, and C exhibit three successive stages in the process of decomposition, as observed by De Luc in the mountains of Silesia). Should a mass of rock be so situated as to preserve its equilibrium in spite of the gradual diminution of its base or point of support, a rocking-stone or loggan is the result. For an exposition of the principle regulating the stability of equilibrium of rocking-stones, see STABILITY. Various explanations have been given of the uses of these singular objects. They are supposed to have been used in very early times for purposes of divination, the number of vibrations determining the oracle; hence it came to be believed that sanctity was acquired by walking round them.

Some rocking-stones occur near to remains of ancient fortifications, which seems to bear out a statement in one of the poems of Ossian, that the bards walked round the stone singing, and made it move as an oracle of the fate of battle. In Greece, rocking-stones occur as funeral monuments, and are generally found on conspicuous places near the sea. Rocking-stones are numerous in Yorkshire, Derbyshire, Cornwall, and Wales. One near Land's End, in Cornwall, has been computed to weigh no less than 90 tons. Near Warton Crag, Lancashire, are no less than seven of these stones. In Scotland,

Rocking Stone.

they occur in the parishes of Kirkmichael, Dron, and Abernethy, Perthshire, and in the parish of Kells, Kirkcudbrightshire. In Ireland, they are found in many places; one situated on the eastern part of Brown's Bay, island of Magee, is popularly believed to acquire a rocking tremulous motion at the approach of sinners and malefactors.

ROCK ISLAND, a city of Illinois, at the foot of the upper rapids on the Mississippi, opposite Davenport, Iowa, 2 miles above the mouth of Rock River, 182 miles west-by-south of Chicago. The Mississippi is here crossed by a railway bridge, and the island from which the town is named has been selected as the site of a national armoury. A dam across a portion of the river gives water-power for numerous manufactories. Pop. in 1860, 5130.

RO'CKLAND LAKE, a beautiful sheet of water in Rockland County, New York, U.S., 30 miles north of New York City, 1 mile from the Hudson, and 160 feet above its surface. It is celebrated for furnishing 200,000 tons of pure ice, annually harvested by about 1000 men, for the supply of New York, and for export.

ROCKLAND, a town in Maine, U.S., on the west side of Penobscot Bay, 40 miles south-east of Augusta. It has a broad and deep harbour, and 64 lime-kilns, making 5000 casks of lime a day, chiefly shipped to Boston and New York. Its commerce employs 18 ships, 40 barks and brigs, and 150 schooners. It has 3 banks, 2 newspapers, 8 churches, &c. Pop. in 1860, 7316.

RO'CKLING (*Motella*), a genus of fishes of the Cod and Haddock family (*Gadidæ*), having an elongated body, compressed towards the tail; the first dorsal fin very slightly elevated, and very delicate; the second dorsal and the anal fins long, continued almost to the tail fin. Several species are found on the British coasts, and are distinguished among other things by the number of their

Three-bearded Rockling or Sea Loach (*Motella tricirrata*).

barbules, three, four, or five. The largest of them is never more than 19 or 20 inches long; the smallest, the MACKAREL MIDGE (*M. glauca*), only about an inch and a quarter. None of the species is much regarded by fishermen, one reason being, that decomposition takes place very rapidly after they are taken out of the water, although, when quite fresh, they are not bad for the table.

ROCK-OIL. See NAPHTHA.

ROCK RIVER rises in the south-eastern portion of Wisconsin, U.S., and runs south-west into Illinois, thence south-west, and empties itself into the Mississippi 3 miles below Rock Island. Its course of 200 miles is through one of the most beautiful and fertile regions in the world, known as the 'Rock River Country.' Its frequent falls give abundant water-power, and it is crossed by 12 lines of railway.

ROCK-ROSE. See CISTUS.

ROCK-SALT is common salt (chloride of sodium) occurring as a mineral and in a solid form. It is always mixed with various impurities. It is found massive or crystallised, its crystals generally cubes, its masses very often either granular or fibrous. It is white, gray, or, owing to the presence of impurities, more rarely red, violet, blue, or striped. For its chemical and other qualities, see SALT. It is a very extensively-diffused mineral, and in some places forms great rock and even mountain masses. A hill of rock-salt near Montserrat, in Spain, is 500 feet high. The island of Ormuz, in the Persian Gulf, is formed of rock-salt. The Indus, in the upper part of its course, forces its way through hills of rock-salt, rising in cliffs 100 feet above the river. In many parts of the world, rock-salt is found in beds under the soil or other rocks. Those of Cheshire in England are particularly celebrated, as at present yielding almost all the salt used in Britain, great part of which is pumped from them in the form of brine. Part is also obtained by mining, as at Northwich. The mines of Wieliczka, in Poland, are of great extent. The workings are at depths varying from 200 to 740 feet, and the salt at the deepest working is the purest. Some of the chambers in the mines are said to be 300 feet high. Blasting by gunpowder is often necessary in the mining operations. The mines give employment to 1200 or 1400 workmen; and they have been wrought for centuries. Vast quantities of rock-salt occur in many parts of Asia, Africa, and America. In Caramania and Arabia, rock-salt is sometimes used for building houses, the dryness of the climate rendering its solubility unimportant.—The salt which crystallises on the margins and bottoms of salt lakes may be regarded as a variety of rock-salt. Concerning the salt of the ocean, the salt found in many desert regions as an efflorescence on the ground or on rocks, the salt with which sandstone and other rocks are impregnated, &c., see SALT.

ROCK-SOAP, a mineral consisting of silica, alumina, peroxide of iron, and water, the silica nearly one-half, the alumina and the water sometimes nearly each one-fourth of the whole. It is earthy, easily broken, black or nearly so, very soft, and easily cut with a knife, is greasy to the touch, and adheres strongly to the tongue. It is valued by painters for crayons. It is found in a number of places on the continent of Europe, and occurs in trap rocks in the Isle of Skye. It is only found massive.

ROCK-WORK, an ornamental structure often introduced into gardens, for the cultivation of plants such as grow on or amongst rocks. It is made of rough blocks of stone rudely piled together, with earth, &c. Simple as it seems, it is very difficult of construction; and too often, after much expense, it has a paltry and ridiculous appearance.

ROCKY MOUNTAINS, that portion of the great ranges of mountains in the central and western portions of North America which lies in the United States and British possessions, a continuation of the Cordilleras of Mexico, between the Pacific Ocean and 105° W. long., and reaching from Mexico to the Arctic Ocean. In the United States, the R. M. extend over a breadth of 1000 miles, and cover an area of 980,000 square miles. From lat. 32° to 40° N., the ranges bear nearly north and south; between lat. 40° and 45° N., their course is north-west; then, after a more northerly bend, they keep a course nearly parallel to that of the Pacific, with many detached ranges and peaks, one of which, Mount Elias, lat. 61° N., long. 141° W., is 17,800 feet high, and marks the boundary-line of longitude between Alaska and the British possessions. Mount Shasta, in the Coast range in North California, is 14,000 feet high; Fremont's Peak, near the western boundary of Wyoming, and the sources of the Yellowstone and Colorado Rivers, is 13,570 feet. In British Columbia, Mount Brown, lat. 53°, is 16,000 feet; and Mount Hooker, 15,700 feet. The passes have elevations of 6000 to 7000 feet, and a vast territory is from 4000 to 5000 feet above the level of the sea. The central range of the R. M. forms the ridge which divides the rivers that fall into the Pacific from those that fall into the Arctic Ocean, Hudson's Bay, and the Gulf of Mexico, and whose head-waters are often interlocked; but between the eastern and western ranges lie the territory of Utah and the state

of Nevada, in which are large rivers having no other outlets than lakes, generally salt, as Great Salt Lake in Utah, and Humboldt's Lake, the outlet of Humboldt's River, in Nevada. The tops of the higher ranges are covered with perpetual snow, and their lower regions abound with artemisias, odoriferous plants, and sunflowers. The rocks are metamorphic gneiss, granites, porphyries, mica and talcose slates, and gold-bearing quartz, with deposits of mercury, silver, carboniferous limestone, coal, and petroleum. Anthracite has been found near Santa Fé, and copper in New Mexico and Arizona.

ROCO'CO, a name given to the very debased style of architecture and decoration which succeeded the first revival of Italian architecture. It is ornamental design run mad, without principle or taste. This style prevailed in Germany and

Rococo Ornament.

Belgium during last century, and in France during the time of Henry IV. The fig. is an example from an altar in the church of St James's, Antwerp.

ROCROI, a small town of France, in the dep. of Ardennes, 15 miles north-west of Mézières, is a fortress of the fourth class, and is situated in a fine, extensive plain, bounded on all sides by the forest of Ardennes. Pop. (1862) 3282. It is memorable for the victory gained by the Great Condé (then Duke of Enghien) over the Spaniards, May 19, 1643. The Spanish army was composed of veteran bands of Walloons, Spaniards, and Italians; and their general, Don Francisco de Mellos, the governor of the Low Countries, was a commander worthy of his army. The French (22,000) were also good troops; but their general, Condé, was a young and inexperienced officer. At first, the battle was unfavourable to the French, but at last the Spaniards were thrown into irretrievable rout. The Count of Fuentes, the commander of the redoubtable infantry, and 10,000 of his men, were among the slain; and 5000 men, with all the cannon, many standards, and the baton of the Count de Mellos, were captured. But, far beyond all material losses, the renown of invincibility, first acquired by the Spanish infantry on the field of Pavia (1525), and confirmed at St Quentin, Gravelines, and Prague, was destroyed.

ROD, called also a *pole*, or *linear perch*, a measure of length of 5½ yards, or 16½ feet. The square rod, called generally a *rood*, is employed in estimating masonry, and contains 16½ × 16½, or 272¼ square feet.

RODE'NTIA (Lat. Gnawers), or RODENTS, in the system of Cuvier, an order of mammalia, almost exactly corresponding with the *Glires* of Linnæus. The order is a truly natural one, and is therefore universally recognised by naturalists. The R. are small quadrupeds; the largest of them—the Capybara—not being equal in size to a hog, whilst to this order belong the smallest of mammalia. They are very numerous, and widely distributed over the globe, particularly abundant in South America, and rarest in Australia. They are all remarkably characterised by their front teeth, variously regarded as incisors and canines—the true incisors or canines being absent—which are large and of peculiar structure, two in each jaw, and separated by a considerable vacant interval from the molars. The front teeth have a plate of hard enamel in front, which wears more slowly than the substance of the rest of the tooth, so that being employed on hard substances, they acquire a chisel-like form, and unlike the teeth of mammals in general, they are always growing from a fresh pulp at the base, so that compensation is made for the wearing away at the tips; but when a tooth is accidentally destroyed, the opposite tooth continuing to grow, sometimes acquires a monstrous shape and size, from which cause rats and other rodents have been known to die, the enormous tooth preventing the eating of food, or even recurving and piercing the skull. The ordinary food of most rodents consists of vegetable substances, and generally of a pretty hard kind, and their front teeth are adapted for comminuting it by gnawing, and are also used for gnawing wood, the shells of nuts, &c., in order to obtain access to food. The molar teeth have flat crowns, having ridges of enamel, which make them more or less tuberculous; and these are in the line of the jaw, whilst the only horizontal motion of which the lower jaw is capable is forwards and backwards, thus making the ridges of the molar teeth powerful instruments for the reduction of hard substances; the jaws also being in general very strong. In the rodents which eat only vegetable food, the molar teeth have rounded tubercles; whilst in the omnivorous kind—as rats—the tubercles become sharp points. The stomach is simple; the intestines are very long; the cæcum is often large, sometimes larger than the stomach itself. The brain is not large, and is nearly smooth, and without convolutions; the rodents are not generally distinguished for sagacity, although some

Skull of the Beaver, shewing the Dentition.

of them—as the beaver—exhibit remarkable instincts. Most of them may be easily tamed, but few of them seem capable of learning anything, and in general they merely acquire a familiarity with man. Of this the rabbit exhibits a very perfect example, although the rat seems to display a far higher intelligence. The eyes are directed laterally. The rodents very generally have the hinder limbs larger than the fore, and their motion is partly a kind of leaping. In some, this is as completely the case as in kangaroos. Some, as squirrels, have an admirable power of climbing trees; and a few, as beavers and water-voles, are aquatic. Most, if not all, have the habit of sitting

on their haunches, and holding their food to their mouth by their fore-paws; using both paws together, however, as the fore-feet have not at all the character of a hand. The thumb is never opposable to the other toes; sometimes it is rudimentary or wanting. The bones of the fore-leg are generally separate, but have not so much freedom of motion as in the *Carnivora*. The toes are terminated by claws. The presence or absence of clavicles (collar-bones) divides the order into two sections, to the first of which, having clavicles, belong squirrels, mice, rats, voles, the beaver, &c.; and to the second, without clavicles, belong porcupines, cavies, chinchillas, hares, rabbits, &c. The rodents are very numerous, about 600 species being known.

RODERIC, the last king of the Visigoths in Spain, whose tragic downfall, coincident with that of the Visigothic monarchy, has inspired poets and romancers (including historians) to throw round him a halo of glory. The Spanish and Arab historians contradict each other in almost every particular of R.'s life—the latter, on the whole, being apparently the more trustworthy. According to them, R. was of humble birth, but rose, through his talent and bravery, to the command of the cavalry. A conspiracy having been formed against Witiza, the reigning monarch, by the clergy and the nobles of Roman blood, R. was elevated to the throne in 709, and by his energy and talent soon quelled all opposition. The sons of Witiza, however, joined with some malcontent Visigothic nobles—among whom was Count Julian—and agreed to summon to their assistance the Arab chief, Muza ibn Nozeir, who had just finished the conquest of Mauritania. The Spanish writers, on the other hand, assert that the country groaned under the tyrannical government of R., that his licentious behaviour had disgusted many of his nobles, and that the people were ripe for a revolution when the Moslem invasion took place. Both are agreed as to the time and mode of the invasion; but the Arab historians brand Count Julian with the most atrocious treachery, as not only voluntarily surrendering Ceuta, the key of the country, but actually guiding the 13,000 Berbers and Arabs under Tarik into Spain. A landing was effected at Algesiras, 28th April 711; and in spite of vigorous opposition from the governor of Andalusia, Tarik marched on, routing R.'s chosen cavalry, which had been sent to oppose him. R., who had been employed in another quarter, now hastened at the head of an army, which is variously estimated at from 50,000 to 100,000 men, to oppose the daring invaders, who by this time had been so reinforced from Africa and by rebels that their numbers amounted to 25,000. The two armies met on the banks of the Guadalete, near Xeres de la Frontera, and on July 17 the battle commenced. R. directed the centre of his army in person, appointing the sons of Witiza to command the wings, and the battle raged furiously for three days; a single combat then took place between R. and Tarik—a kind of statement extremely frequent in eastern histories—in which the former was slain, and his head cut off, to be embalmed and sent to Muza. The Christians, enraged at the loss of their chief, fought furiously during six days longer, but all in vain, for victory now declared itself decisively in favour of the Moslems, to whom the sons of Witiza had deserted soon after the commencement of the contest, and the rout of R.'s army was complete. The most ancient Spanish chroniclers agree in asserting that R. either died on the field or sunk in the Guadalete, whilst attempting to save himself by swimming his horse across; and the various stories of his escape and subsequent adventures are of much later date. This decisive victory laid all Central and Southern Spain at the feet of the Arabs. R. has been made the hero of an epic poem by Southey.

RODEZ, a small town of France, capital of the dep. of Aveyron, stands on the crest and slope of a hill, on the north bank of the Aveyron. Its streets are steep, narrow, winding, and dirty; but the promenades around the town are pleasant. The cathedral, with a clock-tower of great height, is a Gothic structure of the 15th century. A variety of woollen cloths are manufactured, and cheese of a highly esteemed quality is made. Pop. 11,856

RODIYAS, a degraded race in Ceylon, who are expelled from society, and live in a condition more abject than that of the Pariahs of India. By some they are thought to be a branch of the Veddahs (q. v.). Under British rule, which does not recognise caste, the R. have improved socially, and are no longer disqualified for labour. For many interesting particulars respecting this unfortunate race, see *Ceylon*, by Sir J. E. Tennent, vol. ii. p. 191.
